M. Maillet, who was French consul in Egypt in 1692, informs us that, about the end of October, all such inhabitants of Lower Egypt as possess hives, embark them on the Nile, and convey them upon that river to Upper Egypt; calculating to arrive there at the time when the inundation is subsiding, and the lands having been sown, the flowers begin to bud. The hives being come to this part of Egypt, are there placed pyramidically in boats prepared for that purpose, after being marked and numbered by the several owners. Here the bees feed in the fields during some days, and when it is supposed that they have got in all the honey and wax that can be met with within two or three leagues round, their conductors convey them in the same boats two or three leagues lower, and remain there as long as is necessary to enable them to collect all the riches of the new station. Thus the earth forwards its productions, and the plants come into bloom in proportion as they come nearer to their place of abode. In fine, about the beginning of February, after having travelled through the whole length of Egypt, they arrive at the spots whence they had set out, and return to their respective habitations: for care is taken to set down exactly, in a roll or register, every district whence the hives set out in the beginning of the season, their number, and the names of the particular persons who sent them, as likewise the mark or number of the boats, in which they were placed according to their several habitations. Niebuhr saw upon the Nile, between Cairo and

Damietta, a convoy of 4000 hives in their transit from Upper Egypt to the Delta.

Goldsmith describes, from his own observation, a kind of floating apiary in some parts of France and Piedmont. 'They have on board of one barge,' he says, 'three-score or a hundred bee-hives, well defended from the inclemency of an accidental storm; and with these the owners float gently down the stream; one bee-hive yields the proprietor a considerable income. Why,' he adds, 'a method similar to this has never been adopted in England, where we have more gentle rivers, and more flowery banks, than in any other part of the world, I know not; certainly it might be turned to advantage, and yield the possessor a secure, though perhaps a moderate income.'

Dr. Bevan strongly recommends the apiary to be roofed in by erecting a bee-house, or converting to that use some building already constructed, as much preferable to an apiary out of doors, both for convenience and security, as well as ultimate profit. He thus describes his own:—'The whole building, besides answering the purpose of an apiary, may be made subservient to other uses: my own serves for storing potatoes. The potatoe-cellar is sunk two thirds of its depth in the earth, and the bee-house is raised upon it, having a couple of steps up to the door. The dimensions of both are seven feet six inches by six feet clear within, which affords room for five colonies.'

'The piles or stories of bee-boxes are placed in the bee-house at somewhat less than two feet apart, so as to make the external entrances to the several piles about a yard asunder.—(See the plate which forms the frontispiece of Dr. Bevan's work.)

'On the inside of the bee-house, the boxes in the upper row stand about table height, those in the lower about six inches above the floor. On the outside, the entrances to the upper row are about five feet, to the lower about three feet from the ground. The entrances through the wall may be cut in stone, bricks, or wood, and should be chamfered away on the outside, leaving the wall at those parts as thin as practicable, and letting the opening correspond in size with the outlets that are sunk in the floor-boards hereafter described. The potatoe-cellar is built with bricks, the bee-house of timber, lathed and plastered within, and thatched on the outside.

'Where the bees enter the boxes, two wooden shelves or resting-boards are fixed, two or three inches thick, to prevent warping; they extend the whole length of the building, are about a foot wide, and rest on cross pieces nailed fast to the uprights with which the bee-house is built; these cross pieces extend, also, about fifteen inches into the bee-house, where they serve as supporters for the shelves on which the bee-boxes are placed. The resting-boards on the outside are divided, by bricks on the edge, into several compartments, as shown in the frontispiece; the bricks extend the full width of the resting-board, and all the compartments are slated over. Thus the entrances are sheltered, and accommodation is afforded for the bees when they are at any time driven home by stress of weather in greater numbers than can readily pass through the entrances into the boxes.

'The building is not only thatched on the top, but down the sides and ends, as low as the potatoe-cellar. On that side where the bees enter the boxes, the thatch, of course, terminates at the top of the compartments, over which it is spread out so as to conceal the slate coverings. The floor of the bee-house is boarded, and the potatoe-cellar is ceiled, the space between the ceiling and the floor above being filled up with dry saw-dust.'

It is but right to say, however, that Keys is altogether against placing hives on benches, and he thinks it a great deal worse to have them under cots or sheds with shelves therein one above another, on the principle recommended by Dr. Bevan, inasmuch as these afford harbour for enemies, and are inconvenient to manage. Keys himself recommends for each hive separate stands made by driving four strong stakes into the ground three or four feet apart, in the form of a square. Eight or ten of these in one place, he thinks, are enough, and when more swarms are to be disposed of, he thinks it better to have them in separate gardens to prevent quarrels, which often happen when the swarms are numerous.

The various forms of hives will be noticed under the article HIVE.

APICIUS. There were three Romans of this name, all of them celebrated for their love of good eating. The first

was contemporary with Sylla; the second with Augustus and Tiberius; the third with Trajan. Of these the second is the most famous, being celebrated by Seneca, Pliny, Juvenal, Martial, &c. Athenæus (p. 7, Casaub.) places him under Tiberius; besides his general reputation for profuse and delicate attention to the gratification of his own palate, he obtains credit with that author for original genius in the composition of certain cakes, honourably distinguished by the epithet *Apician*. Seneca says that he was alive in his time, and infected the age by establishing a regular school of professors and pupils in the science of good eating in Rome, from which, in the days of simplicity and severity, even philosophers had been expelled as the corruptors of youth. The inordinate expense of his culinary establishment reduced his fortune and involved him in debt; he therefore found himself obliged to look into his affairs, and regulate his expenditure. He found that when his incumbrances were cleared off, he should have left a pittance utterly inadequate to keep such a body and soul together; wherefore, he took poison in preference to pining after unattainable luxuries. Pliny calls him the greatest gormandizer that ever appeared in the world, and mentions various ragouts invented by him: in short, he was the *Cook's Oracle* of imperial Rome. The third Apicius is to be honoured as the inventor of the art of pickling oysters (Athen. 7.); several jars of which he sent to the Emperor Trajan when in Parthia. Distant as was their destination, they reached it in high preservation and tempting savour.

The name of Apicius, long after the time even of the last of these three philosophers, was familiar as a household and culinary word. Their fame was perpetuated by the spirit of party: and the cooks of ages after were divided into Apicians and anti-Apicians. A treatise '*De re Culinaris*' is extant under the name of Cælius Apicius. It is considered by critics as antient, although not written by any of the three whom we have mentioned. Martin Lister republished it in London in 1705, with the title *De Obsonis et Condimentis, sive de Arte Coquinaria*. The humorous Dr. King ridiculed it in a poem, entitled *The Art of Cookery*. (See *Biog. Universelle*.)

A'PION, son of Poseidonius, was born in Oasis, a town in Libya, seven days' journey from Thebes, probably the modern Oasis, called El Wah. Apion was educated at Alexandria, and wished to pass for a Greek native of that city, although he was of Egyptian extraction. Some have thought that the name of Apion is derived from Apis. Apion was a disciple of Apollonius, the son of Archibius, and of Didymus, from whom he imbibed his fondness for the poetry of Homer. Under the emperor Claudius, who reigned A.D. 41—54, he succeeded the Grammarian Theon at Rome. When the Greek inhabitants of Alexandria endeavoured to deprive the Jews who resided there of the privileges conferred upon them by Alexander the Great at the foundation of the city, and confirmed by the Ptolemies and the Cæsars, Apion was appointed to advocate their cause against the Jews. On this occasion he endeavoured to kindle the wrath of the emperor Caius Caligula, by pointing out, that the Jews would neither erect statues to the emperor, nor swear by his name, whilst they preferred to worship the head of an ass made of solid gold, which was of immense value, and was stated to have been first discovered when Antiochus Epiphanes entered the temple at Jerusalem. Antiochus Epiphanes was reported to have taken this idol away, and to have set a Greek captive at liberty, whom he found confined within the sanctuary in order to be sacrificed after having been fattened by the most delicious animal food. It was stated that the Jews were in the habit of preparing every year such a human sacrifice, in the intestines of which they discovered the events of futurity, and that all Jews tasted annually these human entrails, in order to pledge themselves afresh to hate the Greeks.

Apion, with these monstrous fables, did not fully succeed against Philo, who was sent to Rome by the Jews of Alexandria, to plead their cause. Philo, who was at the head of the embassy of the Alexandrian Jews, commenced his reply to Apion's accusation, but the Emperor Caius insultingly commanded him to leave the imperial presence. All expected the worst consequences from the emperor's wrath, but Philo said to the bystanding Jews: Be of good cheer, for Caius attacks us with words, but really he has begun to fight against God. The Emperor sent Petronius, the successor of Vitellius, as legate to Syria, with orders to place a

statue of his imperial, or rather divine majesty, in the temple at Jerusalem. Petronius marched an army into Judæa, but was so much touched with the intreaties of the Jews not to profane their sanctuary, and with their readiness rather to die, than to admit the emperor's statue, that he delayed the commencement of the war, and requested the emperor to revoke his orders: Caius granted this revocation to his favourite Herodes Agrippa, but commanded Petronius to commit suicide for his disobedience. The news of Caligula's death arrived in Syria before the letter in which Petronius was ordered to kill himself, if he would avoid the tortures prepared for him. Thus, Apion's plan to hurt the Jews was providentially foiled. (See Joseph. *Archæologia*, l. xviii. cap. 8.)

Philo's work, entitled *περί ἀπορίας καὶ περὶ πρεσβείας πρὸς Γάϊον*, *Embassy to the Emperor Caius*, is still in part extant. Apion was esteemed for his learning, but already, before his contest with Philo, he was known at Rome as a man of ostentatious character. Tiberius named him *Cymbalum mundi*, *Cymbal of the universe*, on account of his vain boastings; but Pliny, Apion's disciple, calls him rather *publicæ famæ tympanum*, or the *kettle-drum of fame*. The following writings of Apion we find quoted: *Ægyptiaca*, in five books: this work contained a description of the curiosities of Egypt: *A History according to Nations*; *On the Merits of Alexander the Great*; *Against the Jews*; *On the Luxury of Apicius*; *On the Language of Rome*; *De Disciplina Metallica*; *Δίξιν Ὀρνίθων*. But of all these writings, there have only been preserved the story of *Androclus and the Lion* (Gellius, v. 14); and the *Dolphin at Dicæarchia* (Gellius, vii. 8); with fragments from the work against the Jews, preserved by Josephus in his reply.

Flavius Josephus wrote two books on the antiquity of the Jews against Apion after his death. In the first book Josephus refutes the gross mistakes and misrepresentations of Manetho, Berosus, and many other Gentiles who had written without accurate information on the affairs of the Jews. Most of the works against which Josephus wrote are now lost, and only known from his quotations. In the beginning of the second book, Josephus refutes especially the misrepresentations of Apion and his authorities. The dedication of these two books to Epaphroditus, bears some resemblance to the dedications prefixed to the Gospel according to St. Luke, and the Acts, to Theophilus. (See *נורון בן יוסף* pages 535 and 536, ed. Breithaupt. Seneca, ep. 88. Plin. *Præf. Hist. Nat.* and lib. xxxvi. c. 12, Ersch and Gruber; Suidas, ed. Küster, i. p. 267.)

APIS. [See BEE.]

APIS, a sacred bull, whose station and temple were at Memphis in Egypt. He must be distinguished from Mnevis, the sacred bull of Heliopolis. The real or true Apis was known from among all other bulls by certain marks, which are mentioned by Herodotus and Pliny (iii. 28; viii. 46). His birth is commonly described as miraculous; though produced from a cow, his conception was caused by the descent of lightning, or the influence of the moon's beams. When the bull Apis died, or had been put to death after living the prescribed number of years (according to some authorities), a successor was diligently sought for, and, when found, was installed in his temple of Memphis with all due solemnity. The cow was not eaten in Egypt, but the bull was used as food; yet no bull could be slaughtered till it had been first ascertained that it had none of the marks which characterized a sacred bull. When this was ascertained satisfactorily, the priests put a seal or mark on the animal, to signify that it might be slaughtered: no unstamped bull could be slaughtered, under pain of death. The object of the regulation was probably the raising an income by a tax on slaughtered animals. There might possibly be other reasons also. (Herod. ii. 38.)

The worship of Apis existed at least as late as the reign of Septimius Severus. We hear of Greeks and Romans of rank paying their respects to the bull of Memphis, in which curiosity and superstition appear to have been blended. Alexander the Great, when he visited Memphis, sacrificed to all the Gods, and Apis among the rest, in which he showed more political wisdom than the Persian madman Cambyses, who, 200 years before, had insulted the Egyptians by stabbing their deity. Germanicus Cæsar, when he visited Egypt in the reign of Tiberius, went to see Apis at Memphis. It was a favourable sign when the animal would take food from the hand of his visitor, and the reverse was looked upon as presaging misfortune. The bull refused what the hand of Germanicus offered, and the Roman general died

shortly after at Antioch. Strabo describes the Apis and his temple in the following terms, at the time of his visit to Egypt (xvii. p. 807):—'Memphis contains a temple of Apis, who is the same as Osiris. The bull Apis is kept in an apartment (σηκός), and is regarded as a god: he is quite white on the forehead and some other parts of the body, but in every other part black. By these marks they always decide which bull is to be the successor of Apis when he dies. In front of the apartment is an inclosure, in which there is another apartment for the bull's mother. They allow the sacred bull to come into this court or inclosure at certain times, and chiefly for the purpose of being shown to strangers.' The bull Apis, it is presumed (Herod. iii. 29.), was embalmed when he died. Lucas says (vol. i. p. 345, *Voyage fait en 1714*) that he observed bulls' heads in several niches of the catacombs of Abousir: he also found a bull embalmed, and in a great chest, on which the head of the animal was represented; the case, he says, was gilded and painted. (See also *Abd-Allatif*, De Sacy, p. 201.)

The deity Apis was probably a symbol of the Nile (see Jablonsky, *Pantheon*, Apis), or of the earth and fertility, as the cow also was in the Egyptian, and still is in the Hindoo mythology. The god Sivas, in the Indian mythology, has his sacred bulls, which are characterized by certain marks, and a colossal bull of stone is often an ornament of his temples. The bull (but not the cow) is an object of worship still in India. (See Colonel Briggs' *Letters on India*, p. 72.) The sacred bulls of Benares still walk about the streets of the holy city, or stop up the road, and cannot be disturbed without all due respect.

The tendency of the Israelites to fall into the idolatrous worship of the bull or cow is seen from the history in Exodus, xxxii.; and at a later period, Jeroboam, who had spent some time in Egypt, set up two calves, one at Dan and the other at Bethel, and established temples and priests, probably in honour of Apis and Mneuis respectively. (See 1 Kings xii.; compare Hosea, chap. x.; Bohlen's *Altes Indien*, i. 252, &c.; Jablonsky's *Pantheon*.)

APIUM is the botanical name of a genus of umbelliferous plants, among which the only species of any importance is the common celery, *Apium graveolens*. This valuable vegetable is found naturally in the ditches of almost every part of Europe; it is even met with in the Falkland Islands, where, if it has originally been carried thither, it has naturalized itself. In this country it is very common in many places, as, for instance, in the ditches near Sandwich.

It is a remarkable fact that this plant, which is so sweet and wholesome when cultivated, is altogether acrid and unfit for food when wild. It is by some supposed that the difference between the quality of the two states is owing to so large a part of the stem and leaves of the cultivated species being hidden from the action of light by the soil which is heaped up about it, and being in consequence unable to generate in much abundance the peculiar principle on which the acridity depends. Whatever may be the value of this explanation, it evidently does not apply to the variety called celeriac, in which the sweetness and wholesome character of cultivated celery are maintained, although no part of the leaves are deprived of the full influence of light.

For the culture of celery and its varieties, see **CELERY**.

Parsley, which was formerly considered a species of apium, will be noticed under **PETROSELINUM**.

APLOME. [See **GARNET**.]

APOCALYPSE. The word apocalypse (ἀποκάλυψις) signifies literally *uncovering*, *unveiling*, and is used in the New Testament to express especially an extraordinary revelation of the will of God. In this sense the apostle Paul speaks of his 'preaching Christ according to the revelation (κατὰ ἀποκάλυψιν μυστ.) of the mystery, which was kept secret since the world began, but now is made manifest, by the commandment of the everlasting God made known to all nations for the obedience of faith.'—Rom. xvi. 25, 26. Compare also 1 Cor. xiv. 6, where we find that when the Christians assembled, every one had a psalm, a doctrine, a tongue, a revelation (apocalypse), or an interpretation. In these and similar passages the gift of teaching, of interpreting, and of announcing future events is distinguished from the revelation (apocalypse) of the council of God to the spirit of the receiver.

But the word apocalypse is used in a still more confined sense, to express especially the prophetic revelation of the future development of the Messiah's kingdom. Works which describe future conflicts between the power of the

Messiah and the opposing powers of Satan, unbelief and superstition, form the apocalyptic literature. The revelations in these works communicate visions in symbolical language. The *apocalyptic* is a branch of the *prophetic* literature. Every *apocalyptic* book is prophetic, but every prophetic book is not apocalyptic.

Apocalyptic writings develop the future kingdom of the Messiah which constitutes an essential part of the Biblical doctrine in the Old as well as in the New Testament. Apocalyptic, as well as profane, literature, has its epochs and periods of flourishing and of decay; and it is divided into canonical and apocryphal branches.

The first epoch is the Jewish. The book of Daniel is the prototype of all subsequent apocalypses. The fundamental idea of Jewish apocalypses is the first advent of the Messiah in order to lay the foundation of his kingdom. In the Jewish apocalypses, everything concerning the Messiah is future.

The second, or the Christian, epoch, of apocalyptic literature begins after the development of Christ's kingdom: consequently, the Christian apocalypses are clearer than the Jewish. The Jewish apocalypses still continued after the first advent, as long as the ideas about the Messiah retained great vigour among the Jews; but they degenerated into apocryphal imitations of earlier apocalypses. These apocryphal apocalypses of later Jews were often interpolated by Christians. The decay of Jewish apocalypses after the first advent was necessary; because Christianity is the only true continuation of Biblical Judaism. The stream of Jewish apocalypses is lost in the sands of the Talmud. Some account of Jewish apocryphal apocalypses will be given under the articles **HENOCH**, **ESRA**, **PATRIARCHS**, **ISAIAH**.

In the history of the Apocalypse, we have to consider who was the author of the work who calls himself at the commencement of the first chapter:—'Johannes a servant of the Lord.' Some critics have asserted that this description which the author gives of himself is a proof that the Apocalypse was not written by the apostle St. John, but by another servant of the Lord, who would not assume any apostolic dignity; and, further, that in the usual title of the book (Ἀποκάλυψις Ἰωάννου τοῦ Θεολόγου) he is not called St. John the apostle, but only John the *divine*, or the theologian. But most critics suppose that the present title to the Revelations can only refer to that apostle who wrote more explicitly about the divine *logos* (θεοῦ λόγος) than any other of the evangelists. Those who entertain any doubt on this head will find in Suicer's *Thesaurus* that the Greek words from which our terms *theology* and *theologian* are derived, mean respectively in the ancient fathers, especially the doctrine of the incarnation of the *logos* and teachers of the *logos*. Whoever compares the phraseology, imagery, and doctrine of the Apocalypse with that of the gospel and the epistles of St. John, will, indeed, find a great difference. The Greek style of the Apocalypse is strongly tinged with Hebraisms, and its imagery is bold. The style of the gospel and the epistles approaches more nearly to the classic Greek, and is almost without imagery.

Polycarp, bishop of Smyrna, a successor of one of those pastors to whom the seven apocalyptic letters in chap. i. and iii. were addressed, was a disciple and friend of St. John the apostle; and Papias, bishop of Hierapolis near Laodicea, was, according to the statement of Irenæus (*Adv. Hær.* v. 33.), 'a hearer of John and a friend of Polycarp.' Polycarp and Papias were highly esteemed authors. Polycarp's letter to the Philippians is still extant, but of the writings of Papias some fragments only have been preserved. In Polycarp's letter to the Philippians the Apocalypse is not mentioned; but his disciple Irenæus acknowledges its authenticity, and appeals to the testimony of those who had seen the face of St. John.

We have the testimony of the two Cappadocian bishops, Andreas and Arethas of Cæsarea, who lived in the last quarter of the fifth century, that Papias recognised the inspiration and authenticity of the Apocalypse. Andreas says, at the conclusion of his introduction to his commentary on the *Apocalypse*, 'It is unnecessary to make many words about the inspiration of the Apocalypse, since those blessed men, I mean Gregory the theologian and Cyril, and besides these the more ancient also, Papias, Irenæus, Methodius, and Hippolytus, testify to its credibility.' Arethas being later, repeats nearly the same statement in the preface to his own commentary. Papias died, according to the

Alexandrine Chronicle, A.D. 163; therefore he must have been very young when he heard St. John, who died about A.D. 98.

Justinus Martyr, who lived between A.D. 140-160, and was nearly contemporary with Polycarp and Papias, was born in Palestine, and acquainted with Alexandria, Rome, and Asia Minor. At Ephesus he held his famous dialogue with Trypho the Jew, which is still extant. Justinus Martyr quotes in this dialogue Jer. lxxv. 17, &c.; Gen. ii. 17; Ps. lxxxix. 4, to support his doctrines about the millennium, and adds, that John the apostle, in the *Apocalypse*, likewise prophesied, that the believers in Christ should dwell in Jerusalem 1000 years before the general resurrection and final judgment should take place.

Melito, bishop of Sardes, to which town one of the apocalyptic letters is directed, belonged to the biblical critics of the second century, and wrote, according to Eusebius, 'on the devil and the *Apocalypse* of John.' Jerome says, in effect, the same.

Probably at the conclusion of the second century, Theophilus, bishop of Antioch, wrote against the heresy of Hermogenes. This work is lost, but Eusebius, who read it, testifies that Theophilus took some proofs (*μαρτυρίας*) from the *Apocalypse*. Theophilus seems also to use apocalyptic language in his work (*Ad Autolyicum*, ii. 28); 'the demon (devil) is also called dragon (*δράκων*).' Hence we infer that the *Apocalypse* was known in the second century and influenced the language of the Christians.

Eusebius mentions likewise that Apollonius (who was, according to the book *Prædestinatus*, which was written in the fifth century; bishop at Ephesus in the second century) quoted the *Apocalypse* against the Montanists themselves, although these heretics derived their errors especially from this part of the New Testament.

But the most important testimony in favour of the *Apocalypse* is that of Irenæus, who died bishop of Lyons A.D. 202. Irenæus, in his work against heretics, quotes long passages from the *Apocalypse* of John, whom he calls expressly the 'disciple of Jesus' and 'the recipient of the revelation.' This presupposes that its canonical character was then generally recognised. Irenæus defends the apocalyptic number 666 against the spurious 616, by stating that all warranted old manuscripts contained 666, which number was also supported by the testimony of those who saw the face of John. Irenæus modestly confesses his own inability to explain this number, and says: 'If the name of Antichrist were to have been openly proclaimed in our days, it would have been declared by him, who saw the revelation, for it was seen not a very long time ago, but almost in our own age, namely, at the conclusion of Domitian's reign.' This testimony is important, because Irenæus was born in Asia Minor where the *Apocalypse* was published; and he grew up in friendly intercourse with Polycarp of Smyrna. Irenæus knew the friendly circle of St. John, and the accounts which were in vogue among his disciples. Irenæus had a very extensive acquaintance with the most distinguished Christians in the east and west, and took a lively interest in the religious differences and theological debates of the second century; consequently, we have reason to say, that Irenæus was a qualified witness. There can be no doubt that he believed the *Apocalypse* was written by John. Irenæus mentions that the authenticity of St. John's Gospel was attacked by some, but he mentions no opposition to the *Apocalypse*.

The letter by which the Christian congregations at Vienne and Lyons report to those in Asia and Phrygia the persecutions suffered under Marcus Aurelius, A.D. 177, proves likewise that the *Apocalypse* was then much read and generally recognised in Gaul and Asia. Irenæus was presbyter at Lyons when this letter (see Eusebii *Hist. Eccles.* v. 1-3) was written, and, perhaps, it was drawn up by him or under his direction. The numerous Greeks who migrated from Asia Minor into Gaul probably took with them the *Apocalypse*.

The third century is the most interesting in the history of the *Apocalypse*. The disputes against the Montanists raised, among other theological questions, that concerning the authenticity of the *Apocalypse*. (See MONTANISTS.) Tertullian, in his Montanist writings, constantly appeals to the *Apocalypse*, and presupposes its genuineness. (Marc. 4, 5.)

It is very important that the spiritualizing Origen not only mentions the *Apocalypse* as being written by John, (*Comment. in Ev. Joannis* ed. Lommatsch, tom. i. l. 6,) but says very decidedly in his Commentary that John, who re-

clined on the breast of Jesus, wrote the *Apocalypse*. Origen classified the books then used by Christians into *genuine*, *spurious*, and of *uncertain* authority, and numbers the *Apocalypse* among the *genuine* canonical books.

Origen was the greatest biblical critic of the third century; and it is an important fact that, in investigating the canonical limits of the *New Testament*, he did not meet, either in the schools of Alexandria, or in his numerous theological peregrinations, with any sufficient reason for doubting the apostolical authority of the *Apocalypse*. In spite of opposition from a sect called the *Alogi*, who asserted that the *Apocalypse* was an unintelligible and irrational fabrication of Cerinthus, it maintained its authority to the middle of the third century in churches far distant from each other, and it was used in theological researches and ecclesiastical transactions as a holy writing of the apostle St. John. But the Syrian national church, which was established either at the conclusion of the second or the beginning of the third century, omitted in the *Peshito* the second and third epistles of John, the second of Peter, the epistle of Jude, and the *Apocalypse*. These parts were added to the Syrian *New Testament* in or after the sixth century. But Theophilus of Antioch in the second, and Ephraem Syrus in the fourth century, quote the *Apocalypse*, and ascribe it to John. Hence we perceive that the *Apocalypse*, although wanting in the *Peshito*, was recognized among the theologians of the Syrian church. (Compare *Lengerke de Ephraemi Syri Arte Hermeneutica*, p. 5-8.)

During the fourth century the *Apocalypse* was used in the oriental church by Athanasius, Basilus Magnus, Gregorius Nyssenus, Didymus, Ephraem Syrus, and others. But Cyrillus of Jerusalem, who died A.D. 386, in his fourth Catechesis, advises his catechumens to read only those writings of both Testaments which were received by the church, and to neglect the apocryphal publications. Cyrillus gives a list of these canonical writings in which the *Apocalypse* is omitted. But his fifteenth catechesis seems to contain allusions to the apocalyptic phraseology.

The canon of the synod of Laodicea, which was held about A.D. 363, rejects the *Apocalypse* from the ecclesiastical canon; and so likewise the eighty-fifth of the apostolical canons, which belong, perhaps, to the fourth century.

Gregorius Nazianzenus says, in his verses on the genuine books of the inspired Scripture, after having mentioned all the other books of the *New Testament* except the *Apocalypse*, 'Thou hast them all. If there is another besides these, it belongs not to the genuine.' But the same Gregorius quotes, in his other writings, the *Apocalypse* as if he considered it genuine, and he is mentioned by Andreas and Arethas among those who recognized its inspiration and canonical character. Therefore, it is probable that the *Apocalypse* was reserved to the use of the clergy, who, remembering the Montanistic abuses, endeavoured to get the *Apocalypse* out of the hands of the laity without denying its genuineness. By this conjecture an apparent contradiction is solved.

The general ecclesiastical tradition as to the apostolical origin of the *Apocalypse* continued uninterrupted to the middle of the third century, except by the opposition of the *Alogi*. But Dionysius, a disciple of Origen, and bishop of Alexandria, who died A.D. 265, though he admitted the *Apocalypse* to be above his comprehension and the work of an inspired man, gave various reasons for supposing it not to be written by the apostle John. These reasons were subsequently reproduced in substance by Erasmus, as we shall presently mention; and, indeed, every later opposer has repeated the same arguments.

The synod of Toledo, A.D. 633, speaks of 'many who do not receive the authority of the *Apocalypse*, and despise it so much, that they do not preach it in the church of God;' but with these despisers the synod makes short work, saying, 'the authority of many councils, and the decrees of the Roman bishops, prescribe that it is of John the Evangelist, and appoint that it is to be received among the Divine books.' 'If, henceforth, any one does not receive it, or does not preach from it, between Easter and Pentecost, at the time of mass, he shall have the sentence of excommunication.'—(Harduin, *Act. Con.* tom. iii., 584.)

The synod indicates the then prevailing opinion which continued undisturbed during the middle ages. Isidorus of Seville, who died 636, described in his work, *De Officiis Ecclesiasticis*, the *New Testament* canon exactly as the church considered it henceforth to be established and closed.

According to Isidorus, the *Apocalypse* concludes, as being truly apostolical, the whole canon. But it is remarkable, that the *Decretum Aquisgranense* by Charlemagne, A.D. 789, cap. 20, decrees, that according to the synod of Laodicea only canonical writings should be read in the church. The canon of Laodicea is added, in which the *Apocalypse* is omitted. *Corpus Juris Germ.* ed. Walter, tom. ii. p. 1, p. 77, seq. But it appears from Augusti's *Denkwürdigkeiten aus der Christlichen Archäologie*, b. vi. p. 113, &c., that the *Apocalypse* continued publicly to be read in the Western church.

During the middle ages, the antipapal sects, as well as orthodox divines, appealed to the canonical authority of the *Apocalypse*, although they differed widely in its interpretation, but with the Reformation began another period in the history of the *Apocalypse*.

Erasmus (*In Annotationibus in Novum Testamentum*, 1516) reminded his contemporaries of the former doubts, and repeated them more fully in the edition of 1527. He states that from the title *Johannes Theologus*, the frequent repetition of John's name, the difference of style, and the manner in which the author speaks of his own visions less modestly than Paul, (2 Cor. xii. 1, seq.) who relates them as if they happened to another, we might feel inclined to ascribe the Revelations not to John the Evangelist, if the general consent, and especially the authority of the church, had not already settled its genuineness. Nevertheless he relates, apparently with predilection, the opinions of Dionysius, and the uncertainty of Eusebius whether it belonged to the *Homologoumena* (the admitted), or the *Antilegomena* (the disputed).

What Erasmus had cautiously whispered into the ears of the learned, Carlstadt and Luther proclaimed boldly to the people. Carlstadt, in his book *Welche Bücher Biblisch Seint*, 1520, p. 4, divides the *New Testament* into three classes, the last of which contains the Epistle to the Hebrews, the two Epistles of Peter, the three Epistles of John, the Epistle of Jude, and the *Apocalypse*; and he adds, that, among all books of the third order, the *Apocalypse* is the least valuable, because, he says, it was not received in the days of Hieronymus by all Christians; secondly, the title is not *Apocalypsis of John the Apostle*, but of *John the Theologian*. Thirdly, its style and manner differ from those of John the Apostle. 'But,' says Carlstadt, 'I will this and the other books of the third order not reject, but only point out the difference.' In the Preface to the *Apocalypse* in the first edition of his *German Testament*, A.D. 1522, Luther writes: 'In this book of the Revelation I leave every one to his own opinion, and I will bind none by my view and conclusion. I say only what I feel. In this book more than one thing is wanting, so that I consider it to be neither apostolical nor prophetic. First, the Apostles deal not in visions, but prophesy in clear and dry words, as do Peter, Paul, and Christ himself in the Gospel. It befits the apostolic office to speak clearly, without imagery, about Christ and his doing. But there is no prophet in the *Old Testament*, much less in the *New*, who so entirely deals in visions and imagery; so that I deem it only equal to the fourth book of Ezra, and indeed cannot perceive that it was dictated by the Holy Ghost.'

'It appears too much that the author should recommend his own in preference to other holy books, which are much more important, and that he commands and threatens God would take from him whosoever would take anything from the *Apocalypse*; and again, that they should be blessed who keep what is written therein, although nobody knows what it is, much less can he keep it, and it is just as much as if we had it not. There are also many nobler books which we have to keep. Many of the fathers have in former days rejected this; and although St. Hieronymus, with high-sounding words, asserts that it is beyond all praise, and contains as many secrets as words; he cannot prove it, and various passages of his praise are too mild (namely, towards this book). Finally, everybody may think of it what his own spirit lets him (what he pleases). My spirit cannot accommodate itself to this book, and it is sufficient cause for me not highly to esteem it, that Christ is neither taught nor known in it, which, before all things, an apostle ought to do, because he says (Acts i.), "Ye shall be my witnesses." Therefore I adhere to those books which give me Christ clearly and purely.' This preface of Luther was repeated in all editions until A.D. 1534.

The opinions of the reformer influenced the Lutheran

theology during the sixteenth century so much, that it became habitual to divide the *New Testament* into canonical and apocryphal books. To the canonical books only was ascribed an absolute authority in matters of faith; and the Apocrypha, to which the *Apocalypse* was referred, were considered as subsidiary sources of information. (Compare Oeder, *Christlich freye Untersuchung*, p. 51, 313; Hartwig's *Apologie der Apokalypse*, th. iii. p. 35, 48; Storr's *Neue Apologie*, p. 7, seq.; and especially Bleek's *Einführung in den Brief an die Hebräer*, p. 449, &c.)

In the disputation at Bern, A.D. 1528, one of the Roman Catholic interlocutors declared that the *Apocalypse* was written by St. John, and that wherever the Christian church caused the biblical books to be printed, the *Apocalypse* was among them; but Zwingli replied, it could not be proved historically that the *Apocalypse* was written by the Evangelist. Another Roman Catholic interlocutor complained that the Protestants would not admit the testimonies from the books of Tobit, Baruch, Maccabees, and of the *Apocalypse*; to whom Oecolampadius and Zwingli replied, that the Protestants did not absolutely reject the Apocrypha, but they could not admit their authority in the important matter of faith, and they had not been generally received by the old church. (See Zwingli's *Werke von Schuler und Schultheiss*, 2 b. i. Abth. p. 87, 169, &c.) Thus it appears that Zwingli, Oecolampadius, and Bucer, who was present at the disputation of Bern, agreed with Luther and his followers in their estimate of the *Apocalypse*.

The reformers of Geneva, Calvin and Beza, seem to be more favourable to the *Apocalypse*. They quote it often without mentioning the Lutheran classification of canonical and apocryphal books of the *New Testament*. Calvin uses, in his *Institutio Relig. Christianæ*, the *Apocalypse* as canonical and apostolical, but does not interpret it in his *Commentarii*, and thus obtained the often-echoed praise of Scaliger: 'Calvin was wise not to write on the *Apocalypse*.' Beza defends, in his *Prolegomena to the New Testament*, its authenticity against Erasmus, but adds, that if it were not of St. John, he would ascribe it to St. Mark, on account of the similarity of style. On the authority of these reformers the *Apocalypse* was sanctioned as genuine in the *Confessio Helvetica Posterior*, the *Thirty-nine Articles of the Church of England*, the *Confessio Gallica*, and *Conf. Belgica*, and zealously expounded by Theodori Bibliandri (*Explicatio Apocalypseos*, Basle, 1549, p. 8.) and by Artopæus, (Frankfurt, 1549.) and Heinrich Bullinger, who defends it against Erasmus and Luther (*Cent Sermons sur l'Apocalypse*, Genève, 1565). Hyperius (in his *Methodus Theologicæ*, Basle, 1574, p. 48.) did not conceal that its authenticity had been doubted by some, but he declares it to be canonical on the authority of the most ancient fathers. So the theory and practice of the so-called reformed (Calvinistic) church were, in the sixteenth century, decidedly opposed to those of the Lutheran.

The Socinians leaned more towards the reformed than to the Lutheran view. Faustus Socinus (*De Auctoritate Scripturæ Sacræ*, opp. i. 268) declares the *Apocalypse* to be genuine.

Towards the middle of the eighteenth century, the doubts about the authenticity of the *Apocalypse* were revived first in England by a Deist, namely, the unknown translator of *The New Testament in Greek and English, containing the Original Text, &c.*, dedicated to the Lord Chancellor, Peter King, London, 1729; and with more penetration by the anonymous author of the *Discourse, Historical and Critical, on the Revelation ascribed to St. John*. It is now known that this *Discourse* was written by Firmin Abauzit, the famous librarian at Geneva, a friend of Bayle and Newton, at the request of W. Burnet. It was originally written in French, under the title *Discours sur l'Apocalypse*. The original was printed, contrary to the wish of Abauzit, (who died in 1767,) in the edition of his *Œuvres Diverses*, London, 1770. Abauzit's essay gave a new impulse to these critical investigations; and it induced Dr. Leonhard Twells to write his defence of the *Apocalypse* in the third part of his *Critical Examination of the late Text and Version of the New Testament in Greek and English*, 1732; which contains the first essay of a solid defence of the *Apocalypse* by internal and external arguments. T. C. Wolf inserted an abridged translation of this work in his *Cursus Phil. et Crit.*, vol. v., p. 387. The excellent work of Twells, which silenced the adversaries of the *Apocalypse* in England, became known in Germany, where, after thirty years, the combat was renewed.

There was a time when the philologists of Germany generally did not recognize the æsthetical value of the Apocalypse, being influenced by the opinions of Oeder, Semler, and his followers. Herder and Eichhorn, equally learned, without any predilection for orthodoxy, but with more tact than Semler and his school, showed that the despisers of the Apocalypse had only manifested their own want of taste, when they denied the æsthetical value of the Apocalypse; and thus, without being orthodox, Eichhorn facilitated a decision favourable to orthodoxy. Herder observed, that every Christian poet who had a spark of real poetry enjoyed the Apocalypse; that the best hymns of the middle ages, on Jesus, Mary, the church, and the kingdom of God, are crowned with apocalyptic flowers; that Dante, Petrarch, and Milton were imitators of the Apocalypse.

There is in the Apocalypse neither the plastic beauty of the antique, nor the picturesque beauty of our western modern poetry; the oriental poetry loves immensity. The apocalyptic imagination opens heaven and hell, and, rising high above human and terrestrial forms, breaks through the limits of humanity and temporal existence. It calls down the heavenly Jerusalem, dimly shadowed forth by the things temporal. The poetry of the Apocalypse is that of infinity, of destruction, and of endless power.

Bretschneider, Bleek, De Wette, Ewald, Scholt, Lücke, are living divines who have written against the authenticity of the Apocalypse. Their works contain further developments of the old arguments of Dionysius.

Hänlein, Schmidt, Kleuker, Hug, Eichhorn, Feilmoser, Lange, Bertholdt, Guericke, Olshausen, are modern defenders of the authenticity of the Apocalypse; to whom we may add among the English, Lardner and his epitomizers, Dean Woodhouse, the Rev. Hartwell Horne, and others.

The most recent German opposers fairly grant, that the external testimonies are decidedly in favour of the authenticity, but they assert that these testimonies are overcome by the internal philological character of the work.

The Apocalypse has been attacked and defended with greater zeal than any part of the New Testament, because its contents excite a very strong interest either in favour or against this conclusion of the whole Bible. The fundamental idea of the Apocalypse, which Luther and other opposers of the Revelations did not understand, is the following: As Plato, in his books *Περὶ Πολιτείας*, considers the state to be an exact transcript of individual man, so St. John, taking yet a higher step, tells us in the Apocalypse that similar events, which happen in the life of individuals, shall also take place in the infinity of the whole universe.

As the redemption of Christ saves the whole man,—spirit, soul, and body,—so Jesus Christ saves also the universe from sin and consequent perdition. The Apocalypse teaches by a sublime imagery, what the other apostolical writings more obscurely indicate, namely, that there shall be a period in which the spirit of the Lord shall not only operate in secret by governing the hearts of believers, but a period in which it shall entirely conquer, prevailing against all opposition, and shall finally establish a kingdom of universal peace and justice here on earth.

The leading idea, then, of the Apocalypse consists in the complete victory of what is good, and of Paradise regained, or re-established on earth.

APOCALYPTIC KNIGHTS (Cavalieri dell' Apocalisse) were a secret society, formed A.D. 1693, professedly for the defence of the Roman Catholic church against Antichrist. The founder of the Apocalyptic order was Agostino Gabrino, the son of a merchant at Brescia. When, on Palm Sunday, 1693, in the church of St. Peter at Rome, the antiphony of Ps. xxiv was sung: '*Quis est iste rex gloriæ?*' Who is that king of glory?' Agostino Gabrino stepped forward with a drawn sword among the ecclesiastics, crying out, '*Ego sum rex gloriæ*,' 'I am king of glory.' In a similar manner he disturbed public worship in the church of St. Salvator, and was, therefore, confined in a madhouse. A woodcutter belonging to the Apocalyptic knights laid information before the Inquisition against his order; by this tribunal the order was suppressed in 1694, and the knights confined in prison. About eighty knights, most of whom were tradesmen and labourers, wore constantly a sword at their side, even during menial occupations, and a star upon their breast. This star had seven corners and a tail, and was surrounded by a golden thread, which circle represented the terraqueous globe. The tail of the star

represented the sword seen by St. John in the Apocalypse. This order has been accused of an intended rebellion against the papal government and the higher ranks. Agostino Gabrino, called monarch of the Holy Trinity, intended to introduce polygamy, and his knights were to marry pure virgins only. The history even of such a set of madmen is not without its uses: ignorance and fanaticism will, in all ages, produce the same fruits. (See Tenzel's *Monastische Unterredungen* for the year 1694, pp. 672-677, and of 1697, p. 883, &c.; Ersch and Gruber's *Encyc.*)

APOCRYPHA (ἀπόκρυφοι βιβλίοι) are such books as contain secrets and are kept in secret, from ἀποκρύπτειν, to conceal; consequently the term referred to those writings of the Gnostics and other sects which contained the knowledge of those mysteries which were communicated to their partizans only. These books are now known under the name of *pseudepigraphi*, (that is, 'books with false titles,) as the books of Adam, Henoch, the three patriarchs, &c. These volumes formed a kind of heretical canon in opposition to the orthodox canon, and hence arose the signification of the name Apocrypha, which now means *not canonical*, or not belonging to those writings which form the canon of the Holy Scriptures. [See CANON.]

The name *Apocrypha* is especially given to those additions which were introduced into the Septuagint translation of the Old Testament, from whence they were transferred into the Vulgate and many subsequent translations. The reformers separated the Apocrypha from the Old Testament, and Luther placed them between the Old and the New Covenants, under the title of Apocrypha, or books which are not to be esteemed equal to the Holy Scriptures, but are still profitable to the reader. In opposition to the reformers, the Apocrypha were declared to be canonical by the Council of Trent. Hence all translations which follow the Vulgate have the Apocrypha interspersed with the other writings which are admitted by all Christians to be canonical. The Bibles published by Protestants on the Continent place separately—the additions to Esdras; the book of Tobit; Judith; rest of Esther; Wisdom of Solomon; Ecclesiasticus; Baruch, with the epistle of Jeremiah; the Song of the Three Children; Susanna; Bel and the Dragon; the Prayer of Manasseh; the books of the Maccabees. These works, which are principally called the Apocrypha, will be noticed in separate articles. About the year 1821, a debate arose in the British and Foreign Bible Society about the propriety of printing the Apocrypha together with the Holy Scriptures. About 1826, it was decided that the Apocrypha should not be circulated by the British and Foreign Bible Society. Nevertheless the disputes of the two opposite parties were continued for several succeeding years, and many pamphlets were published by both parties, until the apocryphalists were finally defeated by the anti-apocryphalists. Besides the Apocrypha, which form a kind of appendix to the Old Testament and belong to the literature of the later Jews, there are a number of other apocryphal writings of the Old and New Testaments, which have been collected by Fabricius in the *Codex Pseudepigraphus Veteris Testamenti*, and the *Codex Apocryphus Novi Testamenti*, and more completely by Thilo in the *Codex Apocryphus Novi Testamenti*, Lipsiæ, 1832. Most of the apocryphal additions to the New Testament have been collected and published in an English translation by Hone.

APOCYNEÆ, a natural order of plants, belonging to the monopetalous subdivision of the dicotyledonous class. Among these they are known by their flowers being perfectly symmetrical, the segments of the corolla all twisted one way, like a Catherine-wheel, five distinct stamens, a superior ovary which, when ripening, divides into two parts, which diverge from each other at right angles, and by their stems yielding, when wounded, a copious milk. The latter is generally poisonous, and that character is to be taken as general in the order, which abounds in plants the action of which upon the human body is more or less violent; among these, the Tanghin poison of Madagascar (see TANGHINIA) and the Nux vomica (see STRYCHNOS) are remarkable instances. Notwithstanding this, some of the species are not unwholesome; as the hya-hya, or milk-tree of Demerara, and the cream fruit of Sierra Leone; caoutchouc is yielded in abundance by Vahea and Urceola elastica; and the bark of several species is a powerful febrifuge. Considering, however, the great prevalence of poisonous qualities in the order, drugs obtained from any of its species

should be administered with very great caution, until it has been satisfactorily ascertained that they may be employed without danger. The order Apocynæ is only distinguishable from Asclepiadæ by the stamens being distinct from the pistillum, and by the pollen not being contained in little waxy bags.

A'PODES, in zoology, an order of fishes, including, according to the Linnæan system, all those which want the ventral fins, but restricted by Baron Cuvier to those which, besides possessing this character, are likewise malacopterygious. In the latter sense, the apodal fishes compose a small natural family, almost restricted to the great genus *Muraena*, and of which the common eel offers a good and familiar example.

APOGE'E, from ἀπό, *from*, and γῆ, *the earth*, an astronomical term applied to the apparent orbits of the sun and moon, signifying the points of those orbits which are at the greatest distance from the earth. It is opposed to **PERIGEE**, which means the point nearest to the earth. For general considerations connected with this term, see **APHELION**, substituting the earth in place of the sun.

The sun is in its apogee when the earth is in its aphelion, and the motion of the solar apogee is the same as that of the earth's aphelion. The motion of the lunar apogee is more complicated. At new or full moon, its longitude is increasing: at the quarters it is decreasing. But the increase, on the whole, is greater than the decrease: so that, on the average, the apogee increases its longitude daily by 6' 41", or describes a whole revolution in about nine years. In the *Nautical Almanac* will be found the time when the moon is in her apogee and perigee for every month. For example, we find that in January, 1834, the moon is in apogee at fourteen days eighteen hours (meaning eighteen hours after noon on the 14th, or six in the morning on the 15th, civil reckoning). On referring to the moon's right ascension for that time, we find it twenty-three hours forty-four minutes. For further details, see **LUNAR THEORY**.

APOLDA, a town in the grand duchy of Saxe-Weimar-Eisenach, about eight miles north of the University of Jena, and forty miles south-west of Leipzig, lying upon the river Ilm. It has a manufactory of woollens and kerseymeres, and a very large one of stockings, of which it produces about 30,000 dozen pairs a-year: linens, brandy, and spirits, are also made in the town. It has two foundries for bells. Population, 3300.

APOLLIN'ARIS, **C. SULPICIUS**, a grammarian who taught under the reign of the Antonines in the second century, at Rome. Helvinus Pertinax was his most famous disciple, and himself taught grammar till he commenced that career which led him to the throne of the Cæsars. (J. Capitol. *Vit. Pertinacis*, c. 1; *Script. Hist. Aug.*) Aulus Gellius, another distinguished disciple, mentions his master repeatedly, and praises his learning, his moderation in refuting, and his urbanity in teaching. (*Noct. Att.* l. iii. 6; xiii. 17, 19; xviii. 4; xx. 6.) The short metrical arguments of the *Comedies of Terence* are attributed to Apollinaris, in a codex in *Epist. Politiani*. Donatus quotes, in his *Life of Virgil*, an epigram of six lines on the *Æneid*, under the name of Sulpicius of Carthage, who is considered to be the same person as C. Sulpicius Apollinaris.

APOLLIN'ARIS, or **APOLLINARIUS** (Ἀπολλινάριος), a native of Alexandria, taught grammar at Berytus, a town on the coast of Phœnicia, and afterwards in Laodicea of the same country. Apollinaris married and became presbyter of Laodicea. His son, likewise called Apollinaris, was one of the greatest orators, poets, and philosophers of his age. Apollinaris, the younger, became professor of eloquence at Laodicea before A.D. 335, and afterwards lecturer of the Christian congregation. Both father and son continued their intercourse with learned heathens after their ordination. They were friends of Libanius, and attended the lectures of Epiphanius the sophist, who taught at Laodicea, and afterwards in Athens. On this account, and especially because they were present when Epiphanius recited a poem in praise of Bacchus, they were excommunicated by Theodotus, bishop of Laodicea; but again, on doing penance, admitted into church-fellowship. Georgios, the successor of Theodotus, A.D. 350, being an Arian, banished them, either on account of their continued intercourse with Epiphanius, or on account of their adherence to the Nicene Creed and the friendship of the younger Apollinaris for Athanasius. This friendship had commenced A.D. 349, at the time that Athanasius passed through Laodicea. When

Julian forbade the Christians to interpret the Greek classics, the Apollinaris, father and son, composed imitations for the use of schools. The father wrote a grammar for Christians Socrates (*Hist. Eccles.* iii. 16) attributes to the father some epic poems and tragedies, founded on the history of the Old Testament; but Sozomenus (*Hist. Eccles.* v. 18) ascribes these productions to the son, who transformed also the New Testament into the manner and style of Platonic dialogues. After the death of Julian, the classics were read again, and the imitations of Apollinaris forgotten.

The younger Apollinaris is mentioned (in *Athanas. Ep. ad Antiochenos*, tom. i.; *Opp. ed. Montfaucon*, vol. 2, p. 776) as orthodox bishop of Laodicea A.D. 362, whilst Pelagius was bishop of the Arians in that city. He was esteemed, and had some epistolary correspondence with Athanasius, Basilus Magnus, and other great men of that age, who continued to speak respectfully of his merits, even after he was suspected of heresy. Apollinaris distinguished himself especially by polemical and exegetical writings: for instance, by his work on Truth, against the Emperor Julian and the heathen philosophers. Apollinaris thirty books against Porphyrius, against the Manichæans, Arias, Marcellus, and others, were highly esteemed. Hieronymus himself, during his residence at Antiochia, A.D. 373 and 374, enjoyed the exegetical instructions of Apollinaris, then bishop of the neighbouring Laodicea. The interpretations of Apollinaris, quoted in the commentaries of Hieronymus, were peculiarly valuable in those days on account of his knowledge of the Hebrew tongue. Basilus Magnus mentions a work of Apollinaris on the Holy Ghost; and from the works of Gregorius Nazianzenus we learn that his hymns and psalms were often sung in Christian congregations, and much admired. In the year 1552 was published at Paris, a *Metaphrasis Psalmorum* of Apollinaris; and re-edited by Sylburg at Heidelberg, in 1596; this, and a tragedy on the suffering of Christ, in the Works of Gregorius Nazianzenus, were ascribed to Apollinaris, but appear to some critics to be unworthy of his talents.

In the latter part of his life, Apollinaris, who had strenuously defended the Athanasian doctrine of the Trinity, himself incurred the reproach of heresy, because he taught that the divine *logos* occupied in the person of Christ the place of the human soul. According to him, Christ was (ἐνσάρκως) *incarnate*, but not (ἐμφυνός) *insouled*. His disciples, who were very numerous, were called Apollinarists. His heresy became generally known A.D. 371. The accusation of Socrates, Sozomenos, and Theodoret, against the character of Apollinaris, and the low notions which are said to have led him to embrace his peculiar views, are inconsistent both with the chronology and circumstances of his life. Apollinarism was first condemned at the synod held at Rome, A.D. 375, in which the Roman bishop Damasus presided; all mention of the name of Apollinaris was carefully avoided on this occasion. Nevertheless this condemnation induced Apollinaris to form a separate congregation over which he ordained the presbyter Vitalis as bishop. Hence the Apollinarists are also called Vitalians. They are also called Dimœrites, because they were accused of dividing the nature of Christ into two parts.

Before the death of Apollinaris, which happened between A.D. 382—392, the Apollinarists formed in Syria and the adjacent countries several separate congregations having their own bishops. After his death, the Apollinarists were divided into two parties, one of which, under Polemius, or Polemius, and Timotheus, pretended that the divinity and the body of Christ were transformed into one substance, and consequently, that the flesh was to be worshipped as well as the *logos*; these were called Polemians and Synousians; and also *sarkolatæ* (σαρκολάτραι, flesh-worshippers); in retaliation, they called the orthodox *anthropolatæ*, or men-worshippers. The other party, which adhered to the original doctrine of Apollinaris, were called Valentinians.

By imperial command, the public worship of the Apollinarists was impeded A.D. 388 and 397, and A.D. 428 in all towns entirely prohibited. The sects of the Apollinarists assimilated, in the fifth century, partly to the orthodox, and partly to the Monophysites [see **MONOPHYSITES**].

APOLLO, one of the principal gods of the Grecian heaven, also named Phœbus, and in Homer and Hesiod most commonly called Phœbus Apollo (Φαῖβος Ἀπόλλων). He was the presiding deity of archery, prophecy, and music; and in later times of the sun: but in the early poets above-mentioned, the sun (Helios) is a different personage, and

of different extraction, the son of Hyperion and Theia. (*Theog.* xviii. 371: see also the adventures of Ulysses in the island of Thrinakia, where the oxen of the sun, not of Apollo, are always spoken of.) According to Herodotus, (ii. 156,) Apollo is the same with the Egyptian Horus, the son of Dionysus and Isis. The Grecian deity was the son of Zeus and Leto (Jupiter and Latona). His mother, when the time of travail drew nigh, wandered through the earth, unable to find a place which would give her rest; for every land, and river, and mountain, feared too much the wrath of Hera, (Juno,) the jealous queen of heaven, to receive her. At last Delos, which was then a floating island driven about the Ægean sea, and called Asteria, afforded her a place of repose, and Apollo was born. He immediately proclaimed his functions to the assembled goddesses who watched his birth. 'The harp, the curved bow be mine, and I will proclaim to men the unerring counsel of Zeus.' (*Hymn to Apollo*, v. 131.) Thenceforward Delos was fixed. Leto promised, in return for the shelter afforded, that her son should honour that humble island above all other places; and it was always held especially sacred to him, and the principal seat of his worship. This story is beautifully related in the Homeric hymn above quoted, and in the Hymn to Delos by Callimachus. Apollo is a leading personage in mythological fiction, and a favourite with the poets, who have engaged him in a great variety of adventures. He was the president and protector of the muses. He is usually represented in the prime of youth, and manly beauty, with long hair, his brows bound with the sacred bay-tree, (*Daphne*), bearing either the lyre, or his peculiar weapon, the bow. In later times he usurped the presidency of the healing art from its earlier deity, Paëon; hence Æsculapius was said to be the son of Apollo. The hawk, the raven, the swan, the grasshopper, (*cicada*), were his favourite animals. His principal temples were at Delos, Delphi, Tenedos, Patara, Claros, &c.; and from these he derives a great variety of distinctive epithets. He has many others peculiar to himself, which principally refer to his skill in archery, or may be interpreted to contain some allusion to the sun; as far-shooting, silver-bowed, golden-haired, golden-sworded, light-producer, &c.

The word Phœbus is apparently connected with a Greek root, signifying *light*; but the origin and meaning of the word Apollo are entirely unknown. In later writers, and by the Latins, who do not appear to have had an antient sun-god of their own, Apollo and the sun are confounded. It is observable, however, that Ovid, in the stories of Phaeton, and Clytie, which have especial reference to him in his character of the sun, always uses the word Sol, not Phœbus or Apollo, except once (ii. v. 399.) at the conclusion of the former (*Met.* ii. 1. iv. 190). In Homer and Hesiod, as we have said, the two are clearly distinct. It is maintained, however, by some mythologists, and among them by Buttmann, that originally Apollo and Artemis were the sun and moon, and that those later writers who assigned to those deities the presidency over the two great luminaries, only revived the original belief which had fallen into disuse. Buttmann supports his opinion on the grounds that, 'leaving out Apollo and Artemis, there are two places vacant in the list of deities necessary to be found with a people in the state of culture in which the early Greeks were (for Helios and Selene he regards as deities of a later age); that the attributes of Apollo, his golden-sword, arrows, flowing locks, and the epithets given to him, all apply to the sun, as do those of Artemis to the moon; that they are brother and sister, and the children of Leto, (i. e. Night); the attributes of prophecy and archery, he says, would naturally be given to the sun-god, whose eye surveys every thing, and whose beams penetrate every where; and no more suitable patroness could be chosen by the hunter, who lay at night among the mountains, than the moon-goddess, whose mild radiance guided him through the woods and lawns.' (*Keightley's Mythology*.)

APOLLO BELVEDERE, a celebrated statue of Apollo, found at Capo d'Anzo, in the ruins of antient Antium, about twelve leagues from Rome, towards the end of the fifteenth century. It was purchased by Pope Julius II., before his elevation to the pontificate; and was placed by him in the Belvedere of the Vatican, whence it derives its present name. It has been said to be the work of Agasias the Ephesian, but no certain indications of the sculptor are to be traced. But it is now pretty well proved that it was made under the emperors, and probably by the order of Nero himself. (See

Thiersch, *Ueber die Epochen der bildenden Kunst*, &c., p. 312, &c., second edition, 1829, p. 459.)

This statue, one of the finest specimens of sculpture extant, is a standing figure, more than seven feet high. It represents the god naked, except the cloak which is fastened round his neck, and hangs over the extended left arm. The left hand and the right fore-arm were lost, and were restored by Giovanni Angelo da Montorsoli, a pupil of Michael Angelo: so that the original action of the figure can only be conjectured. It was supposed, however, to represent the god at the moment of having discharged an arrow at the serpent Python, watching the effect of his weapon: and accordingly, in the restoration, part of a bow was placed in the left hand. A serpent, the emblem of the healing art, is fixed on the stump of a tree, which gives stability to the figure. We quote Lord Byron's fine description of it.

The lord of the unerring bow,
The god of life, and poesy, and light,
The sun in human limbs arrayed, and brow
All radiant from his triumph in the fight:
The shaft has just been shot—the arrow bright
With an Immortal's vengeance: in his eye
And nostril beautiful disdain, and might,
And majesty, flash their full lightnings by,
Developing in that one glance the Deity.—

Childe Harold, iv. 161.

(See also the Homeric Hymn to Apollo, v. 357, &c.; and *Pen. Mag.*, vol. i., p. 362.)

APOLLODO'RUS, a celebrated grammarian of Athens, of whom an account is given by Suidas. He was a pupil of Aristarchus. Of his voluminous writings, only three books of his *Bibliotheca*, a mythological work, have come down to us. He wrote a chronicle, or history in Iambic verse, extending from the destruction of Troy (B.C. 1184) to his own times (about B.C. 144). (See *Scymnus Chius*, v. 19-49.) Among his other writings was a treatise on the Gods, on the Mimi of Sophron, and on other subjects. Scipio Tetti, a Neapolitan, has written a treatise concerning the persons of different professions and various merit, who have borne this name. The first edition of Apollodorus was by B. Ægius of Spoleto, 1555, 8vo., Rome. The best editions are by Heyne, 1782-1783, four volumes, and 1802, two volumes octavo; and that by Clavier, Paris, 1805, two volumes octavo, with a French translation. Dr. Thomas Gale published a bad edition in 1675.

APOLLODORUS, a celebrated architect in the reigns of Trajan and Hadrian, was born at Damascus. The magnificent stone bridge built over the Danube, A.D. 104, by order of Trajan, was executed under his direction. The remains of this bridge still exist near the junction of the Aluta or Alt and the Danube. He is also said to have been the architect of the Forum Trajanum, in which the column of Trajan stands, and to have built a library, a music-hall (Odeum), baths, and aqueducts. It is said that Hadrian put him to death on some false and frivolous pretence. Apollodorus is the author of a work on besieging towns (Πολιορκητικά) printed in the collection of Thevenot.

APOLLODORUS, an eminent Athenian painter, who lived about four centuries B.C. (See *Plin. Nat. Hist.* xxxv. 9.)

APOLLO'NICON, the name given to a chamber organ of vast power, supplied with both keys and barrels, built by Messrs. Flight and Robson, of St. Martin's Lane, and first exhibited by them at their manufactory, in 1817. The word is formed from Ἀπόλλων (Apollon), and a Greek termination, κον, icon, of common occurrence. The denomination does not appear to us the best that might have been suggested; but, being of Greek origin, was probably thought likely to captivate the multitude, who still entertain a lurking respect for whatever is conveyed through the medium of an antient, to them unknown, language.

The *Apollonicon* is either self-acting, by means of complicated, but very ingenious machinery, or may be played on in the usual manner, by means of keys. The music, when the organ is worked by machinery, 'is pinned on three cylinders or barrels, of about two feet eight inches long, each acting on a distinct division of the instrument; and these, in their revolution, not only admit air to the pipes, but actually regulate and work the stops, forming, by an instantaneous action, all the necessary combinations.' The key-boards are five in number; the central and largest comprising five octaves, and the smaller ones, of which two are placed on each side the larger, two octaves each. To the central key-board are attached a swell and some compound

pedals, enabling the performer to produce all the changes and variety of effect that the music may require. There is also a key-board, comprising two octaves of other pedals, operating on the largest pipes of the instrument. 'These six key-boards are detached from the body of the organ, so that the performers sit with their backs to the instrument, and, consequently, with their faces to the audience.' There are 1900 pipes, the largest twenty-four feet in length, and one foot eleven inches in aperture, sounding the G, two octaves below the first line of the base, the highest giving the A in altissimo, two octaves above the second space in the treble. The number of stops is forty-five, and these in their combinations afford very good imitations of the various wind instruments used in an orchestra. Two drums are also inclosed in the case, and struck by a curious contrivance in the machinery. A tolerably correct estimate of the capabilities of this instrument may be made, when it is stated that it performs Mozart's Overtures to the *Zauberflöte*, *Figaro*, and *Idomeneo*; Beethoven's to *Prometheus*; Weber's to the *Freischütz* and *Oberon*; Cherubini's to *Anacreon*, &c., without omitting a single note of the score, and with all the fortes and pianos, the crescendos and diminuendos, as directed by the composers, with an accuracy that no band can possibly exceed, and very few can reasonably hope to rival. The *Apollonicon* was five years in building, and at an expense of about ten thousand pounds.

APOLLONIUS DYSCOLUS, or ALEXANDRINUS MINOR, a grammarian, who was born at Alexandria in the second century of the Christian æra, and of whose private history we only know a few facts gleaned from Suidas and from a sketch of his life by an anonymous writer, prefixed to the edition published by Sylburgius of the work of Apollonius *On Syntax*. He was the son of Mnesitheus and Ariadne, and is said to have been so poor that he was unable to afford money sufficient even to purchase paper. It was probably this state of poverty which had an effect on his temper, and procured him the name of Dyscolus, or the morose. This second appellation was intended to distinguish him from Apollonius Rhodius, who is sometimes called Alexandrinus Major. He was the author of many works; he was called by Priscian 'Princeps Grammaticorum,' and afforded to that grammarian many hints for his *Latin Grammar*. Of his four remaining works the chief is a *Treatise on Syntax*, in four books, the first edition of which is by Aldus, 1495, Venice. An improved edition was made by Sylburgius, with a Latin translation of Æm. Portus, 1590; the last is by Bekker, Berlin, 1817. At the end of the *Treatise on Greek Dialects*, by Maittaire, Hague, 1718, Lips. 1807, there are some extracts of the Grammar of Apollonius, which were procured by Vossius from a manuscript of the Royal Library of Paris. There is also a work attributed to him, *Ἱεροπιά θαννάσια, Wonderful Stories*, the best edition of which is by Meursius, Lugd. Bat. 1620; but it is not without reason that many have doubted whether he could be justly considered the author. It has been published also by Teucher, Lips. 1792.

APOLLONIUS, (PERGÆUS,) after Archimedes, the most original and profound of all the Greek geometers, was born at Perga in Pamphylia, while Ptolemy III., commonly called Euergetes, was king of Egypt. Ptolemy began his reign B.C. 247.

Apollonius was in the zenith of his fame about the end of the reign of Ptolemy (IV.) Philopator, who died B.C. 205. Apollonius and Hannibal were nearly contemporary both as to birth and achievements in their different lines. Archimedes died B.C. 212, at which time Apollonius was living; it is not known when the latter died.

The life of Apollonius was passed at Alexandria, in the school of the successors of Euclid, under whom he studied. Of its details we know nothing, except that Pappus (who lived, however, as long after him as the fourth century) represents him as vain and envious that Heraclius, who wrote the life of Archimedes, asserts that he surreptitiously obtained the discoveries of the latter, and published them as his own: and that he had a son of the same name as himself. With respect to the charge of plagiarism, Eutocius, his commentator, (about A.D. 540,) who cites the charge, answers it sufficiently by saying, that it was well known that neither Archimedes nor Apollonius pretended to be the first investigators of the conic sections. Bayle objects to this defence, and finds a better one in the silence of Pappus on the subject, who, though disposed, as we have seen, not to think too favourably of the merits of Apollonius, does not

take notice of the charge. To this we would add that Vossius (though Bayle takes it differently) understands Pappus as saying, that Apollonius wrote commentaries upon the four books of conic sections written by Euclid, and added four more to them; thus recognizing him as the author of that part of the work on which, as we shall see, his fame principally depends. We shall also, in the proper place, show grounds for doubting the assertion of Pappus with respect to the books of Euclid.

Of the most interesting part of an eminent man,—his opinions on disputed subjects,—we know but little in the case of Apollonius. Gassendi, in his life of Copernicus, mentions an opinion attributed by the latter to the Grecian geometer, and which is said to have been also that of Philolaus, that the sun and moon only moved round the earth, but all the other planets round the sun. This, so far as appearances only are concerned, is a sufficient explanation of all the phenomena; and, next to the system now received, is the soundest of hypotheses. We cannot find any other authority for attributing this opinion to Apollonius, except Weidler in his *Historia Astronomiæ*, who however cites Gassendi as his authority. But Apollonius certainly paid attention, at least, to the then received system, since known by the name of the Ptolemaic, for Ptolemy has preserved some theorems of his on the method of finding the stationary points of the planets, supposed to move in epicycles. Proclus, in his commentary on Euclid, mentions that Apollonius attempted to prove the axioms, and cites his investigation of the theorem, that things which are equal to the same are equal to one another, in which, as may be supposed, propositions are assumed not more obvious than the theorem itself. The same author gives a definition of an angle which he attributes to Apollonius, but which we confess ourselves unable to understand. Vitruvius cites Apollonius as the inventor of a species of clock which he terms *pharetra*.

The great work of Apollonius which now remains is seven books of his treatise on conic sections, of which we shall presently speak. But besides this, he is known to have written treatises, according to Pappus, *De Rationis Sectione*, *De Spatii Sectione*, *De Sectione determinatâ*, *De Tactionibus*, *De Inclinationibus*, *De planis Locis*, and according to Proclus, *De Cochleâ*, and *De perturbatis Rationibus*. Most of these names would require circumlocution to make them more intelligible in English, and we therefore cite them as they are usually referred to. Of these, the first only is known to us, having been found in Arabic, and published in Latin by Halley in 1708, with an attempt to restore the second. But Mersenne, cited by Vossius, says he read, in an Arabian author, Aben Eddin, an assertion that all the works of Apollonius, more in number than those mentioned by Pappus, were in Arabic at the beginning of the eleventh century. This point is even yet worth the attention of those who pursue oriental literature.

About the end of the sixteenth century, it was a very common exercise of mathematical ingenuity to endeavour to restore these and other lost treatises, that is, from the fullest notion which could be gathered, to guess at the propositions which they might have contained. Such attempts gave rise to the *Apollonius Gallus* of Vieta, the *Apollonius Batus* of Snellius, and other works of Maurolico, Ghetaldi, Adrianus Romanus, Fermat, Schooten, Anderson, Halley, R. Simson, and others.

The conic sections of Apollonius are in seven books, the first four of which are extant in Greek, with the commentary of Eutocius of Ascalon, above-mentioned. The three next were supposed to be lost, till the middle of the seventeenth century, when James Golius, a celebrated orientalist, professor of Leyden, returned from the East, with the whole seven books in Arabic. Some delay took place in their translation and publication, during which, in 1658, Borelli accidentally discovered an Arabic manuscript in the Medici library at Florence, of the same seven books. It does not a little serve to illustrate the use made of public libraries, that while one author after another had for years expressed regret at the loss of the last four books, three of them should be lying in one of the most celebrated libraries in Europe, in the heart of a capital city, with an Italian title-page. Borelli, and Abraham Echellensis, an oriental professor at Rome, translated from the Arabic, and published their version in 1661. At the time of the discovery, Viviani was engaged in restoring the lost books, and when it was made known, he prevailed on the Grand Duke of Tuscany to mark

all his papers, and to order Borelli to keep the contents of the new books secret. The work of Viviani, well known as an acute and accomplished mathematician, was found (see Montucla, i., 250) to fall short of that of Apollonius on several important points, though, as might be expected, the views of the Italian of the seventeenth century were more extensive in many cases than those of the Greek. The eighth book was still wanting, and a note to the version imported by Golius informed the reader that it had never been found, even by the Arabs, in the Greek. But when the Oxford press, at the commencement of the last century, was employed upon the magnificent versions of the Greek geometers, which are still the best in public use, Dr. Aldrich, observing that the preliminary Lemmas of Pappus to the seventh book were asserted to belong to the eighth, and also that the latter appeared, from the words of Apollonius himself in his introduction, to be a continuation of the former, proposed to Halley that he should endeavour with these lights to re-establish the missing book. Halley was then employed in completing the edition of the work, which the death of Dr. Gregory had interrupted, and he acceded to the suggestion. The whole appeared at Oxford, in 1710, with the commentary of Eutocius, the Lemmas of Pappus, and in addition, the work of Serenus on the same subject. This is the only edition of the Greek text.

The contents of the work are thus briefly described by Apollonius, of whose words we give a free translation. The first four books are elementary: the first contains the generation of the three sections of the cone, and of the sections which are styled opposite, and their principal distinctive properties, which have been treated by us more fully and generally than by any of our predecessors. The second book contains the properties of the diameters, and axes, as well as of the asymptotes, and other matters of general utility: you will hence see what *I have called* diameters, and what axes. The third book contains many and wonderful theorems, which are useful in the composition of solid loci, of which the majority are both new and beautiful. The fourth book shows in what manner sections of a cone, or of opposite cones, may cut one another, and the circumference of a circle, on the whole of which nothing has been delivered by those who went before us. The remaining four books treat of the higher part of the science: the fifth, on maxima and minima: the sixth, on equal and similar sections: the seventh, on *dioristic* theorems, or theorems useful in the solution of problems: and the eighth, on the problems thus solved.

Apollonius was the first who used the words *ellipse* and *hyperbola*, of which Archimedes does not take notice, though he uses the term *parabola*. He also, as we see above, first distinguishes the *diameters* of the section from the *axes*. It was, moreover, in his time, and perhaps first by himself, that the *general* sections of the cone were considered; for previously it had been usual to treat only of those, the planes of which were at right angles to one of the sides of the cone; so that an ellipse could only come from an acute angled cone, and so on. Though Archimedes was aware that all the sections of any cone were of the same nature as those of the limited character above-mentioned (at least it is customary so to state), yet all testimony is against this having been known in the time of Euclid. If, therefore, Apollonius really took the books of Euclid, as according to Pappus he did, he must have so changed the face of them, by generalizing the method of cutting the cone, and introducing the properties of diameters, that they must have differed as much from their original in form and matter as one book can from another. To conclude the subject of the authorship, we remark, in reference to the charge of Heraclitus above-mentioned, that the styles of Archimedes and Apollonius are very different: the latter has by no means the power of the former in the management of his demonstrations, and though remarkable for the originality and beauty of the results which he produces, is even tedious in the method of obtaining them. A supposition of Mydorge, which once created considerable discussion; viz., that the fifth, sixth, and seventh books were the work of some Arab under the name of Apollonius, deserves no attention. He must have been but a foolish Arab who would have been willing to relinquish the credit of having written the fifth book.

The most remarkable book in the whole work is the fifth, which treats of maxima and minima. With a little licence it might be called a complete treatise on the curvature of

the three sections, for in considering the number of maxima and minima which can be drawn to the section from any point in its plane, the space inside and outside of the evolute has different properties. There is only wanting the addition of a name for the curve which separates the spaces (which we now call the evolute). This book, and the quadrature of Archimedes, are the highest points of the Grecian geometry.

The work of Apollonius was lightly spoken of by Descartes, who is supposed to have seen the first four books only; but it was held in particular estimation by Newton, and Cardan places its author *seventh* among all the men who have ever lived: in his own age he was called the *great geometer*.

We now briefly mention some of the principal editions of the conics. The celebrated Hypatia, daughter of Theon, wrote a commentary upon them. We have already mentioned Pappus and Eutocius as commentators, Borelli and Halley as editors. Among the Arabs, it was first translated by Thebit-ben-Cora, under the Calif Al Maimun in the ninth century: by Abalphat, in the tenth; and two editions, of little celebrity, appeared in Persian in the thirteenth. In Europe, it was first translated, but badly, by Memmius, a Venetian, in 1537; by Maccoly about the same time, but we cannot learn that this edition was ever published; also by Commandine in 1566, (mis-printed 1666, in Murhard,) and by the Jesuit Claude Richard in 1655. Montucla is incorrect in saying that this edition was announced and never published. See Murhard, *Bibl. Math.* ii. 322; also Bayle, art. *Apollonius*, and Vossius, *de Sci. Math.* (Index, *Claudius Richardus*.) In 1669, Ravius published a translation, of which Halley remarks, that it is more barbarous than can easily be imagined. In 1679, Barrow published the first four books.

Apollonius is supposed by some, among others by Vossius, to be the author of a commentary on Aratus: but Grotius, in his edition of that poet, takes no notice of the report, and as it is believed that Apollonius, the grammarian, also commented on Aratus, the two may have been confounded. Wallis, who held that the ancients possessed a certain algebra which they disguised, seems a little inclined to found this opinion upon a title-page which he discovered in the Savilian library (the rest being cut away). It was *Liber de Arte Notoria, secundum Apollonium*, but he also suspects that the *Ars Notoria* may be *magic*, and the *Apollonius* may be Apollonius of Tyana. Algebra was called by many Italians *ars magna*, or *arte maggiore*. That Apollonius did improve the notation of arithmetic appears from the praise given to him by Eutocius, in his commentary upon the quadrature of Archimedes, for a work which he calls *Ἀριθμητικόν*. The word is probably corrupt; Vossius reads *Ἀριθμὸν*, and Halley *Ἀριθμολογίον*. In the *editio princeps* of Archimedes, Basle, 1543, the Greek is as usual, but the Latin translation gives *Mocyncotium*. Pappus more explicitly states that the improvement consisted in a simplification of the method proposed by Archimedes for representing very large numbers, which brought the system nearer to that of the moderns. (See Delambre, *Hist. Ast. Anc.* ii. 9.) Eutocius also says, that Apollonius extended the quadrature of the circle given by Archimedes.

APOLLONIUS RHODIUS, a Greek epic poet, respecting whose personal history only a few facts have come down to us, and even these are by no means well authenticated. Whether he was a native of Alexandria in Egypt, or of Naucratis, a small town on the Canopic branch of the Nile, is a point impossible to determine; but we know that he derived the surname of Rhodius from his long residence in the island of Rhodes. He was the son of Silleus, and spent his early years at Alexandria under the direction of the poet Callimachus. The exact periods of his birth and death are unknown; but we are able to fix some points in his history from other circumstances. Thus we know that Callimachus died about B.C. 230, so that he must have been acquainted with this poet at an early age, and Apollonius succeeded Eratosthenes as keeper of the great library of the Ptolemies at Alexandria, B.C. 194. The cause of his quarrel with Callimachus can only be guessed at: it is said to have been respecting the *Argonautica* of Apollonius, which was not sufficiently admired by Callimachus. In what way the disappointed poet took his revenge we are not told; but it must have been effective, if we may judge from the bitter retort it produced from Callimachus. His poem entitled *Ibis* was directed

against Apollonius, and though no fragments of it remain, we can form some opinion of its character and leading features from the *Ibis* of Ovid, which is said to be an imitation of this poem. Apollonius left Alexandria, probably, in consequence of this quarrel, and took up his residence at Rhodes, where he lived for many years, and was at last recalled to his native country to occupy the place of the learned Eratosthenes. These few facts are gleaned from Suidas, and from a short account of his life prefixed to two of the most ancient manuscripts.

Of all his works only one poem remains, entitled *Argonautica*, in four books, containing 5835 verses, and giving a detailed account of the wanderings of the Argonauts. This was a favourite subject with the ancient poets; but how much Apollonius borrowed from his predecessors Herodorus and Epimenides, or whether he servilely copied Cleon in the whole design of his work, as an ancient scholiast asserts, we have no means of determining. The opinion of Quintilian (x. 1, 54) seems to be just and impartial. He considers the poem as possessed of considerable merit, but greatly deficient in true poetic spirit. (See also Longinus on the *Sublime*, xxxii.) It is easy to perceive that Apollonius does not possess the qualities which constitute a great poet: he impedes the narrative with a minute and superfluous detail of circumstances till the reader's patience is fairly worn out. There is an affectation too of learning which often degenerates into pedantry. He has been most successful in his treatment of the tender passions: nothing can be more beautiful than the manner in which he paints the gradual progress of Medea's love for Jason till it became one absorbing passion. In this he is not surpassed by Virgil, who is said by Macrobius (*Saturn.* v. 17, ed. Bipont.) to have borrowed his idea of Dido's love for Æneas from this part of the poem of Apollonius.

Many learned Greeks wrote commentaries on Apollonius: and the Latin poet Valerius Flaccus closely imitated him in his work, also entitled *Argonautica*. Terentius Varro translated it into Latin: in still later times it was turned into Iambic verse by Marianus. The first edition of this work was published at Florence, 1496, and is of great value to book collectors. That of Beck, Lips. 1797, containing the text of Brunck with some corrections, a good Latin version, and an excellent table of contents, is one of the best editions. A. Wellauer published a new edition at Leipzig, 1828, 2 vols. 8vo. It has been translated into English by Green, Fawkes (1797), and Preston (1803); into Italian by Flangini (Roma, 1791); into German by Bodmer (Zürich, 1779); and into French by Caussin (1797). For explanatory works, the reader may consult Schoenemann, *Comment. de Geograph. Argon.* Götting. 1788; Gerhard, *Lectiones Apollonianæ*, Lips. 1816; Weichert, *Ueber das Leben und das Gedicht des Apollonius von Rhodus*, Meissen, 8vo. 1821.

APOLLONIUS, a celebrated statuary of the island of Rhodes, who, along with Tauriscus, executed a group in marble which represented Zethus and Amphion binding Dirce to the horns of a furious bull, to avenge their mother, Antiope, whom she had cruelly persecuted. This group, described by Pliny (xxxvi. 4), is supposed, with much probability, to be what is known to us under the name of the Toro Farnese, found during the reign of Paul III. in the ruins of the Baths of Caracalla. It must not, however, be supposed that we see it exactly in the state in which it was found. The lower half of the figure of Dirce, the two trunks and a leg of Zethus and Amphion, were the only remnants of the ancient sculptors, but it is sufficient to prove that the art was then in its highest degree of perfection. The group has been restored in the very worst taste by a Milanese artist, Batista Bianchi. We have no means of discovering, with any degree of certainty, at what time Apollonius lived, but some have imagined that it was a few years after Alexander the Great. (See Piranesi, *Statue*; Maffei; Winkelmann, vi. i. p. 128; Müller, *Handbuch der Archæologie*, &c. p. 137.)

APOLLONIUS, a celebrated statuary, the son of Nestor of Athens, only known to us from his name being inscribed on the fragments of a statue which was discovered in the fifteenth century, and is now called the Torso Belvedere. It has neither head, arms, nor legs, and yet it is considered one of the master-pieces of antiquity. Michael Angelo made it his grand object of study; and so enthusiastic was he in his admiration of it, that even after his sight failed him, he used to be led to it that he might enjoy the pleasure of feeling it with his hands. All agree as to its being one of the

finest specimens of ancient sculpture, but there is some doubt as to the period when Apollonius lived. Meyer, in his *History of Greek Sculpture*, p. 296, imagines that he discovers a great resemblance between the Torso Belvedere and the Ilissus of the Parthenon, while Thorwaldsen, acknowledging fully the merits of the statue, considers it the production of a much later age. Others think that this opinion is confirmed by the particular form of the letters in the inscription, but no dependence can be placed on this circumstance, as the name may have been inscribed centuries after the statue was executed. Visconti, Pio Clementino, t. i. plate x; Winkelmann, x. iii. s. 15; Thiersch, *Kunst-Epochen*, p. 333.

APOLLONIUS, the Sophist, supposed to have lived at Alexandria in the time of Augustus, is the author of a Lexicon of Homeric words, entitled Δίξεσ' Ὀμυρκαί. It was first published by Villoison at Paris, in 1773, in two vols. 4to, accompanied by a commentary and prolegomena. The work was reprinted at Leyden in 1788, 8vo., with notes by Tollius, but with the omission of Villoison's Latin translation and prolegomena.

APOLLONIUS of Tyana was born, at the commencement of the Christian era, in Tyana, a town of Cappadocia. At the age of fourteen, his father, Apollonius, sent him to Tarsus, to study grammar and rhetoric under Euthydemus, a Phœnician. Dissatisfied with the luxury and indolence of the citizens, Apollonius obtained his father's permission to retire with his master to Ægæ (Ayas), a town near Tarsus, where he became acquainted with the doctrines of various philosophers. His master, Euxenus of Heraclea in Pontus, was little disposed to practise the austerities of the Pythagorean and neo-Platonic sects, the doctrines of which he professed. Apollonius observed the Pythagorean rules more strictly, took up his abode in the temple of Æsculapius at Ægæ, famous for miraculous cures, abstained from animal food and wine, lived upon fruits and herbs, avoided in his dress every article made of animal substance, walked barefoot, and let his hair and beard grow. The priests initiated him in their mysteries, and said that Æsculapius himself rejoiced at having Apollonius a witness of his cures. Apollonius recommended his moral and ascetic doctrines by example, and by an appeal to the heathen gods. He healed a young Assyrian afflicted by a disease which was a consequence of intemperance, by teaching him that the gods were willing to give health to all who were willing to receive the gift. Having finished his studies at Ægæ and other cities of Cilicia and Pamphylia, Apollonius travelled by land to India. At Niniveh he met with Damis, who became his interpreter and travelling companion. On a rock of Mount Caucasus he saw the chains of Prometheus. King Bardanes, his priests, and magi, honoured him at Babylon. In Taxila, a town of India, he met with the king, Phraortes, a descendant of Porus. In India he also saw a woman consecrated to Venus, who was black from the head to the chest, and white from the chest to the feet. He joined a party who hunted dragons by magic. The eyes and scales of these dragons shone like fire, and were talismans. He saw the animal *martichoras*, (mentioned four centuries before by Ctesias,) with the head of a man and the body of a lion, fountains of golden water, men who dwelt below the ground, griffins, the phoenix, the precious stone pantarbas casting rays of fire, and attracting all other gems, which adhered to it like swarms of bees. Phraortes recommended him to the president of the gymnosophists, who revealed to him all their secrets, convinced him that Pythagoras had borrowed his wisdom from them, and compelled him to recognise their superiority in the performance of miracles. Apollonius returned from India by sea, was much admired in the towns of Asia Minor, conversed at the grave of Achilles with the ghost of this hero, enchanted the demons, and uttered prophecies. He threatened the Ephesians with pestilence unless they would mend their immoral lives. They were converted, but nevertheless the plague broke out among them. The Ephesians sent messengers to Apollonius, then at Smyrna, requesting him to drive away the plague. Apollonius was in a moment at Ephesus, conversed with the people in a theatre, commanded them to stone a beggar, and ordered them to remove the stones on the following day, when, instead of the beggar, a large dog was found in which the demon of the plague had entered, the ravages of which had now ceased. The Greek priests at Athens, in the Peloponnesus, the oracles at Paphos, Pergamus, and Colophon, heaped their marks of honour upon Apollonius.

He afterwards went to Crete, and finally arrived in the reign of Nero at Rome, where he and his followers being questioned by the magistrates concerning the object of their journey, overcame their mistrust by restoring to life the lead body of a noble lady, predicting an eclipse of the sun, and that there should happen and not happen a great event, which prediction was considered to be fulfilled when, three days after, the cup which Nero held in his hand was struck by lightning. When Nero left Rome for Greece, he ordered all foreign philosophers to quit the city. Apollonius went to Spain, and stirred up a rebellion against Nero and the Romans. He then visited Africa, the south of Italy, and Sicily, where he heard of the death of Nero. Apollonius again visited Athens, and was initiated by the hierophant of Eleusis into the mysteries of that place. He next visited Egypt and Ethiopia, and sought for the sources of the Nile. In Egypt he joined Vespasian, who probably found it politic to gain a man whose sanctity and miracles had raised him to the rank of a deity; for during his lifetime, and still more after his death, Apollonius enjoyed this distinction, and was sometimes ranked with Jesus Christ. (See *Life of Alexander Severus*, by Lampridius, cap. 29.) Afterwards he revisited Asia Minor and Rome, where he was accused by Euphrates of high treason against Domitian, and cast into prison. Having blamed the emperor for suffering such reformers, he removed to Puteoli, where he met his followers, Damis and Demetrius. He again visited Sicily, Greece, and Asia Minor, performed miracles, and had many adventures, until he died, eighty, or ninety, or one hundred, or one hundred and seventeen years old, either at Ephesus, or at Lindus in the temple of Pallas. Others say that he was chained, and shut up in the temple of Dictynna in Crete to be eaten by dogs. But when the temple was reopened, the voices of invisible virgins proclaimed his elevation to the skies, and his chains were found burst asunder. These statements are chiefly found in *The Life of Apollonius* by Philostratus. The two first books exist in an English translation by Charles Blount, Lond. 1680, fol. In 1693, this translation was suppressed on account of the annotations being hostile to Christianity, and Blount committed suicide. Philostratus wrote the Greek original by order, and from the information of Julia, the wife of Septimius Severus, who died 217. The empress had obtained possession of the account which Damis had formerly given to a relative.

It is almost needless to remark that the life of Apollonius is a heap of absurdities and impossibilities. Apollonius was probably a cunning impostor, and one of the pretenders to miracles, not uncommon in that age: his biographer, Philostratus, must have been rather credulous if he believed one half of what he wrote about his hero. The fact of Apollonius being mentioned by no writer earlier than Apuleius and Lucian (see his *Alexander*), tends to show that his celebrity during his lifetime was not so great as his biographer would have us believe. Philostratus himself wrote his account of Apollonius about a century after the wise man's death. Some extant letters, attributed to Apollonius, are printed in the collection of Aldus and Cujacius; and a few appear in his life by Philostratus. For further remarks on the character of the *Life of Apollonius*, see PHILOSTRATUS, *CLAUVIS*. A remarkable passage in the *Life of Aurelianus* chap. 24) by Vopiscus, shows that the fame of Apollonius was even then firmly established, and that temples and statues still existed in honour of this 'true friend of the gods,' as the credulous historian calls him.

It appears from Suidas and Eudocia, that a person called Iotericus Oasites also wrote a life of Apollonius.

APOLOGE'TICS (*theologia apologetica*, *apologetik*) is the designation given in Germany to that branch of divinity which is most intimately connected with logic, metaphysics, and general history, and has for its object a systematic arrangement of those internal and external evidences by which Christians are enabled scientifically to justify the peculiarities of their faith. The name is derived from a Greek adjective *apologētikos* (*ἀπολογητικός*).

Since Christianity was opposed from the beginning by men who denied its high origin and its intellectual superiority, circumstances demanded on the part of Christians a compliance with the express injunction of the apostle Peter, 'Be ready always to give an answer (*πρὸς ἀπολογία*, or an *apology*) to every man that asketh you a reason of that hope which is in you.' (1 Pet. iii. 15.) Separate apologies have the same relation to apologetics that sepa-

rate mathematical treatises have to the science of mathematics.

The science of apologetics was not the offspring of literary vanity; it was unknown till the attacks of the adversaries of Christianity assumed a learned and scientific character. In the first centuries of our æra, whilst most opposers asserted that the Christian religion was the cause of famine, and earthquakes; and that Christian worship consisted in eating children, drinking human blood, committing incest, and adoring the head of an ass, or some such abominations, separate apologies were sufficient for the refutation of these absurd charges. The name is of still later origin than the science of apologetics. The word *apologetik* was universally adopted after Gottlieb J. Planck had used it. (See his *Einleitung in die Theologischen Wissenschaften*, 1794-8, vol. i., p. 231-362.) As the fundamental idea of mathematics is that of quantity; of jurisprudence, that of right; of æsthetics, that of the beautiful; so the fundamental idea of apologetics is that of supernatural revelation. The apologetics contain a further development of one part of dogmatics or doctrine, which is called bibliography. Apologetics teach how to defend the fundamental ideas of Christianity against unbelievers; polemics teach how to attack those who, admitting the Christian revelation to be true, err in particulars.

The science of apologetics treats of the

I. Possibility of revelation.

1. Logical possibility. Logical refutation of those who, like John Toland, Edelmann, and Rousseau, considered the idea of revelation to be self-contradictory.

2. Theological possibility. Metaphysical refutation of those who considered the idea of supernatural revelation to be repugnant to the attributes of God, impartial justice, general love, and immutability.

3. Anthropological possibility. Refutation of those who, like Immanuel Kant, deny the ability of man to perceive the supernatural.

II. Necessity of revelation, to be demonstrated by historical and ethnographical induction, especially by the history of philosophy.

III. Reality of revelation, demonstrated by a development of the internal evidence of the peculiar Christian doctrines, and confirmed by the historical credibility of the Gospel history.

Apologetics, though based upon the Gospel, constantly require a new adaptation to the times for which they are written. There are many good apologies, but apologetics are yet in their infancy. Although they are lectured upon in the universities of Germany, they are yet a desideratum in England.

Among the societies, foundations, donations, &c., which have an apologetic character, may be mentioned the Bampton Lectures at Oxford, Hulse's foundation of the Christian Advocate at Cambridge, the London Society for promoting Christian Knowledge, with all similar societies, the Society for the Defence of Christianity at the Hague, &c.

APOLOGIES OF THE FATHERS are writings in defence of Christianity, composed from the beginning of the second to the sixth century. The opposers of Christianity generally attacked the moral character of the Christians rather than their doctrines. The fathers of the church, with the view of refuting the doctrines of heathenism and the false accusations against the followers of Jesus, composed *Apologies*, which were partly addressed to all well-informed heathens, partly written on particular occasions, and addressed to emperors in order to convince them of the injustice and folly of persecutions.

The apologies of Quadratus and Aristides are lost. Justinus Martyr describes, in two apologies, how he sought for truth in various systems of philosophy until he found it in the Gospel. In his Dialogue with the Jew Tryphon, Justinus Martyr appeals to the prophecies of the Old Testament. The apologies of Justinus contain many materials for the history of philosophy. Athenagoras defended the Christians against the charge of atheism, incest, infanticide, and other abominations with which they were charged. Tatianus, Theophilus of Antioch, and Hermas, proved the absurdity of paganism and the contradictions of philosophers in order to show the necessity of revelation.

After these Greek apologists of the second century followed, among the Latins, Tertullian, who, in his *Apologeticus*, eloquently shows how the faith and holiness of Christians were especially manifested under persecutions; and Minucius Felix, who, in his eloquent dialogue, *Octavius*

introduces the representatives of various parties, whose arguments are overcome by the truth of the Gospel. Cyprian wrote *De Idolorum Vanitate*, or, On the Absurdity of Idolatry. These apologists of the second century did not defend the systems of certain schools, but only the truth of Christianity.

In the fifth century the doctrines of the Gospel were systematized by Origen among the Greeks and Arnobius among the Latins, in order to defend them successfully against the attacks of Celsus, Porphyrius, Hierocles, and Julian, which were directed not only against the morals of the Christians, but also against their history and their doctrines. These writers compared the miracles of Jesus with those of Pythagoras and Apollonius of Tyana, and questioned the credibility of the Evangelists. They recognised the leading facts of the Gospels, but endeavoured to prove contradictions in minor points. The objections are answered in the eight books of Origen against Celsus, who wrote his attack on Christianity about one hundred years before it was replied to by Origen. But the greatest apologist among the fathers is Eusebius, whose historical and chronological works have an apologetical tendency, and whose evangelical preparation (*προπαρασκευή εὐαγγελική*), or *Εὐαγγελικὴ ἀποδείξις προπαρασκευή* contains, in fifteen books, the introduction to his Evangelical Demonstration (*εὐαγγελικὴ ἀπόδειξις*), in twenty books. The first ten books of this work are still extant, in which he demonstrates the harmony of the Old with the New Testament, the moral dignity of Jesus, the sublimity of his plan, the rectitude of his disciples, and the absurdity of those who ascribed another plan to the disciples than that which they professedly followed. Eusebius examines, in a little publication against Hierocles, the life of Apollonius of Tyana by Philostratus, and shows the contradictions of the biographer, the knavery of this notorious individual, and how his performances differed from the miracles of Christ. The works of Athanasius and Chrysostomus contain apologetical materials. Cyrillus of Alexandria wrote ten books in reply to the emperor Julian. Theodoret wrote twelve sermons under the title 'Ἑλληνικῶν θεραπευτικῆ παθημάτων ἡ εὐαγγελικὴ ἀληθεία ἐξ Ἑλληνικῆς φιλοσοφίας ἐκτιννωσίς, in which he gathers the arguments for Christian truth from the writings of the heathens, and compares the Greek philosophers with Moses, the prophets, and the apostles. The most important apologetical works among the Latins are the seven books of Arnobius (*Adversus Gentes*) against the heathen; the seven books of Lactantius, *Institutionum Divinarum*; the twenty-two books of St. Augustin, *De Civitate Dei*; the catalogue of St. Jerome, by which he refutes the objection that no distinguished individuals embraced the Gospel (*Catalogus Virorum Illustrium*); and, finally, *Orosii libri septem Historiarum adversus Paganos*, in which he refutes the assertion that plague, famine, earthquakes, and other horrible events were consequences of the Gospel. The science of apologetics has made progress in the same ratio in which the attacks upon Christianity became more systematic.

The following translations and editions will be interesting to English readers. Justin the philosopher, commonly called Justin Martyr, died about A.D. 165. His *Apologia prima pro Christianis*, published by Dr. Grabe, Oxon., 1700; *Apologia secunda*, by Hutchinson, Oxon., 1703; *Justin Martyr's Full Account of the Christian Worship, Baptism, and the Lord's Supper*, with Notes of Dr. Grabe and Mr. Whiston: *Dialogus cum Tryphone Judæo*, London, 1722, 8vo.; *The Apologies of Justin M., Tertullian and M. Felix, with the Commentary of Vincentius Lirinensis*, by Reeves, 1709 and 1716—an unfaithful translation; *The Dialogue with the Jew*, by Brown, London, 1755, is an excellent translation, and very scarce in the book-market. Minutius Felix, of the third century, author of *A Dialogue between Cæcilius a Heathen, and Octavius a Christian*, is well translated by Sir David Dalrymple.

APOLOGUE, synonymous with fable (*ἀπόλογος*, *fabula*, fable), 'a novel story contrived to teach some moral truth.' (Johnson.) 'It would be a nigh relief . . . to hear an *Apolo-*logue, or fable, well told, and with such humour, as to need no sententious moral at the end to make the application.' (Shaftesbury, *Charact.* vol. iii., *Miscell.* iv. c. 1.) It is essential to an apologue that the circumstances told in it should be fictitious. Some have gone so far as to say that they must involve an impossibility, as in Æsop's fables, where we find beasts and inanimate things made to think and speak.

APOLOGY (*ἀπολογία*), a Greek word, originally signifying a defence made in a court of justice by or for a person accused. (See the titles of several of the extant Greek orations.) The word *ἀπολογίζεσθαι*, to 'apologize,' to 'make a defence,' was the corresponding verb. There is extant a small piece attributed to Xenophon, entitled the *Apology of Socrates*; and another, with the same title, by Plato. The word apology was adopted by the Christian fathers [see APOLOGIES]. At the present day it is only used in ordinary language in one sense, that 'of asking pardon or excuse for some offence.' But even in modern times the word has occasionally been used in the early Christian sense, as by Bishop Watson in his treatise entitled an *Apology for the Bible*, and by Barclay in his *Apology for the Quakers*.

APOPHTHEGM (*ἀπόφθεγμα*), a Greek word signifying 'a thing spoken out,' and, in its more technical sense, a pithy saying calculated to arrest the attention. 'Certainly *apophthegms* are of excellent use. Cicero prettily called them *salinas*, salt pits, that you may extract salt out of, and sprinkle it where you will. They serve to be interlaced in continued speech. They serve if you take out the kernel of them and make them your own.' (Bacon.)

We may take the following as examples of apophthegms. — 'Bigotry murders religion, to frighten fools with her ghost.'—*Lacon*. 'We ask advice, but we mean approbation.'—*Ibid*. Plutarch made a collection entitled *The Apophthegms of Kings and Generals*, and dedicated it to the Emperor Trajan. Many of these apophthegms would be classed in modern times among anecdotes. The following is an example; it is one of the apophthegms placed under the head of Alexander:—'An Indian was taken prisoner who had a very high reputation for archery, and was said to be able to shoot an arrow through a ring. Alexander bade him exhibit a specimen of his skill, and on his refusal, the king in a passion ordered him to be executed. On his way to his death the man remarked to those who were taking him, that he had not practised for several days and was afraid of missing his mark. Alexander hearing of this, admired the man, and setting him loose, made him great presents, because he preferred death to the loss of his reputation.' (Wytenbach's edit., vol. p. 718.)

The Lacedæmonians were noted for affecting the apophthegmatic mode of speech; and Plutarch has collected these sentences also under the title of *Laconica*.

APOPHYLLITE, a crystallized mineral, whose fundamental form is the square prism, fig. 1. Its most general modification is obtained by supposing the angles of fig. 1 cut off, so as to give rise to a plane triangular surface, as seen at *a* in fig. 2; these faces *a*, from the plane cutting deeper into the original crystal till they intersect each other frequently lose their triangular form, and of course, at the same time, the face *P* again becomes a square, and the prism will be terminated by the form seen in fig. 3. On account of these modifications, apophyllite sometimes assumes the form in fig. 4.

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

The inclination of *P* on *a* is $120^{\circ} 5'$
 " *L* on *a* is $128^{\circ} 20'$
 " *a* on *a* is $104^{\circ} 18'$

The structure of this mineral is lamellar, and admits cleavage in directions parallel to the sides of the regular prism, but most readily in the perpendicular to its axis. Its colour is white or grey, sometimes tinged green or red. It possesses various degrees of transparency, and occurs either opaque. In hardness it approaches nearly to a patite: it

its density varies from 2.3 to 2.5. Before the blow-pipe it forms a white glass. Its chemical constitution is stated as follows:—

and the mineral is therefore an hydrated silicate of potash and lime.

Apophyllite has been found in the mines of magnetic iron-ore of Sweden and Norway; in the lead-mines of the Harz mountains; also in the cavities of several basaltic rocks, at Marienberg in Bohemia; at Fossa in the Tyrol; in the isle of Skye, &c. In the basalts it is usually accompanied by analcime and stilbite.

APOPLEXY, from *ἀποπληξία*, a sudden blow, a deprivation of power and motion, &c. *Morbus attonitus*, *sideratio*, *percussio*, &c., are synonymous terms. In the animal body two sets of functions perfectly distinct from each other are combined, the ORGANIC and the ANIMAL; the organic include the various functions by which the structure of the body is built up and its integrity maintained, and the animal include the functions of sensation and voluntary motion. [See LIFE.] The disease termed apoplexy is an affection of the animal functions, the organic remaining comparatively unimpaired. It is the loss of sensation and voluntary motion, while respiration, circulation, secretion, and the other functions of the organic life continue to be performed, though not indeed without more or less disorder.

Of all the diseases to which the human body is subject, there is none which is commonly conceived to attack so suddenly, and to kill so rapidly. What is usually called the attack is indeed sudden; but the disease itself, so far from being sudden, is generally even slow in its progress, giving distinct and repeated indications of its presence and of its course. The signs by which the apoplectic constitution is denoted, the PREMONITORY signs of the disease as they are termed, it is of the utmost importance to observe, because judicious measures adopted at this stage will almost always avert an attack, or render an attack mild which would otherwise have been mortal. There are few other diseases over which both the physician and the patient have so much control: the patient by the general management of himself, in removing the constitutional predisposition to it; and the physician by active remedies when the attack is instant, in effecting what the general management may have proved inadequate to accomplish. Prevention is often practicable; but when the attack has once come on, life is in imminent peril: the most judicious and powerful remedies, though resorted to instantly, and employed with the greatest skill, are commonly unable to avert death; and even when they do succeed, the functions of the brain and the general health have usually sustained so severe a shock that life is no longer worth possessing.

In general, the PREMONITORY symptoms are steady in their nature, uniform in their course, and so obvious that all may perceive and understand them. Considered individually, they may appear numerous and diversified; but they are really so much alike, that they all obviously belong to one class.

Among the premonitory symptoms the most remarkable are the following, which are here enumerated in the order of their importance and frequency.

1. Drowsiness. This feeling may exist in every degree from unusual dulness of mind to an uncontrollable propensity to sleep. There may be merely inability to fix the attention, or to carry on the intellectual operations with the usual vigour, or the individual may absolutely fall asleep in the midst of his ordinary occupations. The last is the more alarming event, and for that very reason the less dangerous, because it is a circumstance with which few can fail to be struck; but an unusual heaviness or torpor of mind may be overlooked or neglected: and thus, when at last the apoplectic attack comes, though warning of its approach were really given, it may be truly a surprise. Connected with drowsiness, and occasionally in the room of it, there is a sensation of weight in the head, or a feeling of fulness.

2. The next premonitory symptom is giddiness. Giddiness is more alarming than drowsiness, and would never fail to produce a conviction of danger, but that giddiness often arises from other causes; for example, from a disordered state of the stomach. Whenever giddiness is present, while the functions of the stomach are sound, its source should be carefully investigated; and even when the digestive functions are manifestly disordered, it should still be minutely

investigated and vigilantly watched, because tendency to apoplexy and disordered stomach may co-exist, and the symptoms of the latter may mask those of the former. If the giddiness be combined, as it often is, with a feeling like that of approaching fainting, it may be considered that there is but a single step from the actual supervention of the paroxysm.

3. Connected with these two important symptoms are a number of subordinate sensations, which are of consequence chiefly as marking the presence of the more serious indications. The sensations in question are the ordinary companions of the first two, and are often the most prominent and obtrusive, and therefore serve to direct attention to the more important symptoms. Such concomitant and subordinate symptoms are, frequent yawning, dulness of hearing, imperfect or disordered vision, noise in the ears, moles or sparks before the eyes, repeated sneezing, occasional hiccup, and the like.

4. All this time there is generally some degree of pain in the head. The intensity of the pain may vary from the slightest uneasiness to the most intolerable headache. The slightest degrees of pain are more common than the severer, the patient usually stating that his pain is trifling. The seat of the pain is often in the forehead, and deep in the socket of the eyes, rendering them intolerant of light; but it may also be at the back part of the head, extending down the neck, between the shoulders. In the severer states of pain it is often attended with dulness and redness of the eyes, flushing of the face, and throbbing of the arteries of the neck and head. Frequently, however, there is no degree of pain whatever, and this is the occasion of a false security, alarm not being taken at the presence of the other symptoms because of the absence of pain. In general, when serious disease attacks vital organs, pain is excited, and we are thus warned of our danger; but sometimes a mortal disease invades an organ without inducing the slightest pain, and there is no disease more apt to do this than apoplexy. If, combined with the other premonitory symptoms, there be pain in the head, the inference is obvious; if there be none, the danger is the greater; for the enemy is as certainly at hand, but his approach is insidious.

5. Last in the train comes a symptom which is more important than any of the preceding, because it demonstrates their true nature, and shows that the actual attack is instant; namely, paralysis, whatever its form or degree, whether it assume the shape of inability to articulate distinctly, or to write steadily, or to walk firmly, or in reading to fix the eye on the right line, or in talking or laughing to keep the mouth in the natural position, or in deglutition to swallow without unusual difficulty, or without exciting cough. If with this loss of muscular power there be at the same time a sense of pricking over the skin, or a numbness in the limbs or fingers, or difficulty in voiding the urine, or distortion of the face or mouth, dropping of the eyelid, stammering, unsteadiness in the gait, and so on, the attack may be considered as having actually commenced.

Of these premonitory symptoms one alone may be present, or two may be combined, or several may co-exist or may follow each other in rapid succession. The period of their duration, before the attack supervenes, is different in every individual case. Sometimes there elapse only a few hours; more frequently several days; occasionally many weeks. When they are present, no man is safe from a fatal attack for a single instant.

With regard to the attack itself, the phenomena are different according to its intensity. There are, indeed, various modes or forms of the disease which are mainly matters of degree: nevertheless, these diversities are not only very striking in their own nature, but in a practical point of view are highly important, because the remedies appropriate to the one are not suited to the other, at least without such modifications as, in point of fact, to render them different remedies.

For all practical purposes it will be sufficient to comprehend the various forms of the disease under four heads, namely, first, that in which the attack is sudden and violent; secondly, that in which the attack is comparatively slight at the commencement, but progressively increases in severity; thirdly, that in which the attack commences with apoplexy and terminates in paralysis; and, fourthly, that in which the attack commences with paralysis and terminates in apoplexy.

1. The sudden and violent form constitutes the *apoplexia*

fulminans of the older authors; the *apoplexia fortissima* of more modern writers; and the *apoplexie foudroyante* of the French. In this form of the disease the patient is struck senseless and motionless instantaneously: he falls down and lies utterly deprived of all the functions of the animal life. The organic functions in the mean time go on, but in an unnatural and disordered manner. The respiration is slow, deep, and accompanied with that peculiar noise which is called stertor; the pulse is fuller, stronger, and slower than natural; the urine and fæces are passed without consciousness; the skin is covered with a cold and clammy perspiration; foam flows from the mouth; the face is flushed, tumid, and sometimes even livid. Death may take place in a few minutes, or a few seconds, or not until the end of the first, or even the second, day; but life is seldom protracted beyond the second day. Now and then the prompt and vigorous employment of the appropriate remedies saves life even in this form of the disease; but if they fail to restore consciousness in a few hours, they commonly fail altogether, and death almost always happens when the paroxysm continues undiminished during twenty-four hours.

On examining the state of the brain after death from this variety of the disease, the blood-vessels of every part of the cerebral substance and of the delicate membranes that invest it are found gorged with blood; there is also sometimes an effusion upon its surface, beneath its membranes, and within its cavities, of the thinner portion of the blood called serum, while, in many cases, pure blood itself is poured out on various parts of the brain from some ruptured vessel. Occasionally no morbid appearance can be detected sufficient to account for the attack, or for death, the consequence of it.

2. In the second form of the disease, in which the attack is less violent in the commencement, but progressively increases in severity, the loss of sensation and voluntary motion is neither sudden nor complete, or, if it be so, the abolition of these functions is only of momentary duration. Instead of stupor and coma, the patient is seized with a sudden and violent attack of headache, attended often with sickness and vomiting. The pain of the head is sometimes so severe that the patient sinks down under it, pale, faint, and exhausted, occasionally with a slight convulsion; but from this state of depression he recovers rapidly, still however remaining weak, faint, and chilly, with a quick and feeble pulse, a sunk countenance, and occasional vomiting. This state having continued from one hour to three, or more, the heat increases, the pulse acquires strength, the face becomes flushed, the sunk expression of the countenance disappears, and torpor or stupor rapidly supervenes, the patient appearing dull and heavy, answering questions slowly and with difficulty, and sinking at last into a state of profound coma. From the first invasion of the attack to the coming on of perfect coma, the period may vary from one hour to three days and more. This form of the disease is at least equally dangerous with the preceding, and, in fact, generally proves fatal.

On examining the state of the brain after death from this variety, there are found extensive effusions of blood; softening of the substance of the brain; sometimes ossification (conversion into bone) of portions of its membranes; but far more constantly ossification of the coats of its blood-vessels, which organic change in the structure of the blood-vessels diminishes their strength, renders them incapable of resisting the current of the blood and of carrying on the circulation, and thus predisposes them to rupture.

3. The third form of the disease commences with a distinct apoplectic paroxysm, which terminates in paralysis. When the apoplectic symptoms disappear, some part of the body is found to be paralyzed; it may be the muscles of the face, giving rise to various kinds of distortion; or the muscles of the limbs, occasioning inability to move the affected member; or the muscles of one side of the body, producing what is called *hemiplegia*; or the muscles of one half of the body, *paraplegia*. In the great majority of cases the speech is more or less affected, the power of articulation being either wholly lost or greatly impaired. Often the sensibility seems unimpaired, the patient endeavouring to express himself by words or signs; but, at other times, the mind itself is indistinct, confused, rambling, and incoherent. Occasionally in this form of the disease the apoplectic state disappears rapidly, while the paralysis remains for years. Sometimes the paralysis slowly diminishes until suddenly another apoplectic attack supervenes, leaving the paralysis

greater than before; at other times the paralysis continues undiminished for days, months, and years, until a second, or a third, or a fourth apoplectic paroxysm at length destroys the patient. In the few cases in which there is a perfect recovery from the paralysis, the mind is always slow in recovering its energy, and often never regains it.

On examining the state of the brain after death from this variety, there is commonly found an extravasation of blood into a defined cavity formed in the substance of the brain, constituting what is termed an apoplectic cell; but although this be the most ordinary form in which the blood is effused in this variety of the disease, yet there may also be a general extravasation of it, as in the other varieties, or mere effusion of serum; or softening of the cerebral substance, or ossification of the membranes, or of the blood-vessels, or several of these morbid conditions may be combined.

4. In the fourth and last form of the disease, in which the attack commences with paralysis and terminates in a complete apoplectic paroxysm, the premonitory symptoms are, in general, very distinctly marked. Drowsiness, giddiness, disordered vision, impaired memory, and pain of the head especially, commonly precede the attack. While the brain is thus affected, the limbs about to become paralytic are troubled with pricking, tingling, numbness, weakness, and cramp. These local ailments progressively increasing, the limbs at length become decidedly paralytic, and the paralytic state having continued for an indefinite period, an apoplectic paroxysm supervenes, often preceded and denoted by spasms or convulsions in the unparalyzed limbs. The coma which forms a part of the apoplectic paroxysm, sometimes comes on gradually, and is manifestly progressive in intensity, the patient at first being capable of giving a coherent answer when strongly roused, but by degrees the loss of sensation becomes more and more complete, until at last the stupor passes into a state of total insensibility, from which there is no recovery. Now and then the patient recovers from the apoplectic state, and slowly regains the condition he was in previously to the apoplectic attack: more frequently, on the contrary, the paralytic affection increases, and another apoplectic seizure quickly supervenes, which proves mortal.

In some cases the morbid appearances that present themselves on inspection of the brain after death from this variety, differ in no respect from those which have been described as belonging to the preceding form; but the most frequent and characteristic morbid change is the softening of some portion of the substance of the brain. This softening of the cerebral substance is the result of inflammation, which is generally not acute in its nature, and is slow in its progress. The vessels belonging to this softened portion lose their vitality, and allow the red particles of the blood to pass through them, so that the part morbidly changed is not only soft but red, from the infiltration of blood through the diseased blood-vessels.

From this account of the phenomena of the disease, and of the morbid changes apparent in the brain in fatal cases, we are enabled to form an accurate conception of the pathological condition of the brain in apoplexy. Two of the conditions essential to the performance of the functions of the brain, are a supply of a certain quantity of blood, flowing with a certain impetus and freedom from pressure. Without a certain portion of blood flowing with due impetus, the functions of the brain fail; with more than a certain portion, or with the velocity of the current quickened or retarded beyond a certain point, they equally fail: and when the pressure induced by either of these states exceeds a certain degree, they also immediately cease. The substance of the brain is tender and delicate, and abounds beyond all other organs with blood-vessels. It is of a soft and yielding nature, but it is enclosed in a firm, unyielding case. Coupling this fact with the phenomena of the circulation, it is easy to conceive how almost its entire mass, and still more readily how particular portions of it, may become subjected to undue pressure, and how, as an inevitable consequence, the functions of the brain may become deranged. Any cause which quickens or which retards the circulation through it may produce this effect: for example, a preternatural distension of the arteries with blood, or a preternatural intensity in their action, and a consequent increased impetus of the circulation; or, on the contrary, a relaxation of the veins, a preternatural turgescence of them from a too great quantity of blood poured into them, and a consequent retardation of the circulation through

them. Either from a too great velocity or intensity of the circulation in the arterial vessels, or from too great distension of the veins in consequence of an impeded flow of the blood through them, the thinner portion of the blood or serum may be poured out upon the brain, which in this manner may become subject to undue pressure. In consequence of either of these diseased states, the coats, whether of the arteries or veins, may suddenly give way and break, and the blood poured out upon the brain from the ruptured vessels may exert such a pressure upon it as instantly to destroy its functions. Again, tumors occasionally form in the brain, which progressively increase in magnitude, and at length exert such a degree of pressure upon the cerebral substance, as is no longer compatible with the performance of its functions.

The brain, like all other organs, is nourished by organic processes, over which the organic nerves exert a most important influence. The blood-vessels of the brain, like those of all other organs, depend for their vital energy on organic or ganglial nerves [see *Nerves*], which are distributed to them in great abundance. We may conceive that the organic nerves which preside over the nutriment of the brain may fail in their functions to such a degree, that the brain may be deprived of its vital power, and hence its functions necessarily cease. And this without doubt is the case in those fatal attacks of apoplexy in which no morbid appearance can be detected in the brain sufficient to account for death. We may conceive that the organic nerves which impart vital energy to the blood-vessels of the brain may fail in their functions to such a degree, that the blood-vessels may not only be incapable of performing their natural actions, but may become diseased in structure, their membranous, firm, and elastic coats becoming indurated, brittle, and bony. On the other hand, these organic nerves may become preternaturally irritable, and consequently produce an inordinate action in the blood-vessels. And those are the ordinary changes which precede and which predispose to apoplexy; and, in a practical point of view, these facts are of paramount importance, for they show that apoplexy is not a sudden disease, that it is even slow in its progress, and that it is as much in our power to retard or stop that progress, by the judicious employment of remedies tending to restore the brain to a sound condition, as it is by the use of such remedies to check morbid changes of structure in any other organ of the body.

Prognosis.—When once an attack has come on, even though it be slight, it places the individual in imminent danger, both because it greatly increases the predisposition to a recurrence of the paroxysm, and because, when it does not destroy life, it gives a shock to the constitution which is seldom entirely repaired, and never without much time and most judicious management. In the paroxysm the immediate danger is proportioned to the profoundness of the coma, the degree of stertor, the slowness and laboriousness of the respiration, and the frequency and intermission of the pulse. Other unfavourable signs are, delirium, convulsions, paralysis, involuntary and unconscious discharge of the urine and feces, and above all, the continuance of the paroxysm without material diminution of its severity after the judicious employment of powerful remedies. When the respiration is exceedingly slow and laborious—when the pulse sinks to such a degree that it can be scarcely felt, and when the head, chest, and limbs are covered with a cold, clammy sweat, dissolution is near. On the other hand, the favourable signs are, mildness of the paroxysm, diminution of the symptoms after the exhibition of the appropriate remedies, and more especially restoration to consciousness, return of the power of voluntary motion, with a calm and soft pulse, a gentle, warm, and general perspiration, and a spontaneous flow of blood from the nose, the rectum, and so on.

Causes.—The causes of the disease are either predisposing or exciting. The *predisposing* causes are, 1. Sex. It is decidedly more common in the male than in the female, because the male is more exposed to the exciting causes, and nothing so surely generates a predisposition to the disease, as the long-continued operation of an exciting cause. 2. Age. It may occur in childhood and youth: it is indeed rare in the former, but it is not uncommon in the latter; still, however, the great majority of cases without doubt occur at the more advanced stages of life. The period commonly conceived to be that in which it most frequently occurs, is the interval between forty and seventy. Out of

sixty-three cases, two were between twenty and thirty years of age; eight from thirty to forty; seven from forty to fifty; ten from fifty to sixty; twenty-three from sixty to seventy; twelve from seventy to eighty; and one from eighty to ninety years. 3. Conformation of the body. The large head, short neck, full chest, sanguine and plethoric temperament, have from time immemorial been considered as forming the apoplectic constitution, and though the disease may and often does occur in the very opposite states of the system, yet there cannot be a question that the conformation of the body just described is peculiarly favourable to the formation of that pathological condition of the brain on which, as we have seen, the malady depends. 4. Mode of life. Luxurious living, especially combined with sedentary habits, is a most powerful predisposing cause. 5. Suppression of accustomed evacuations, namely the suppression of the piles, or of discharges from the skin, whether from the sudden disappearance of eruptions, the result of natural disease, or the drying up of a seton or issue. 6. Mental states. Violent emotion: cases continually occur in which persons drop down suddenly in a fit in a paroxysm of anger. Long-continued anxiety is almost as powerful an exciting cause as luxurious living. It is the common opinion that the studious are more prone to this disease than other classes; but this notion is ill-founded, for the evidence is complete that moderate intellectual labour is not only in a high degree conservative of the general health, but that it is more especially preventive of that peculiar condition of the brain on which apoplexy depends. The condition of all others most conducive to apoplexy is that in which at a somewhat advanced age the food habitually taken is large in quantity and rich and stimulating in quality, at the same time that the intellectual faculties are little excited; while the history of lawyers, judges, and philosophers, would indicate a remarkable exemption from this disease in all its forms.

The predisposing causes, of whatever nature, act either by favouring an habitual determination of blood to the brain, or by impeding its return from this organ, or by impairing its vital energy, while they favour a plethoric state of its vessels. Such a condition of the brain having been formed, the slightest exciting cause is often sufficient to produce an attack.

Among the most powerful *exciting* causes are intemperance in eating and drinking, violent emotions of mind, whatever determines the blood with undue impetus to the brain or impedes its return from it, such as great muscular exertion, dependant posture of the head, tight ligature around the neck, the use of the warm bath, and the like.

Both sets of causes, the predisposing and the exciting, bring about a paroxysm either by diminishing the vital energy of the brain, or by producing undue pressure on its substance.

Treatment.—The treatment of this disease must obviously vary with the pathological condition of the brain on which it depends. The skill of the physician consists in detecting what that pathological condition is, and in exactly adapting his remedies to it, which must differ widely according as he is called to treat a threatening or an actual paroxysm, or to prescribe for a patient subsequent to an attack. To enter into a discussion of the different remedies suited to the manifold states of the brain, and of the system, in the various forms and stages of this malady, would require a larger space than can be allotted to it in this work. There are not many parts of his science in which the physician is required to make such nice and difficult distinctions, and in which life so completely depends on the accuracy of his discrimination. At one time the vital energy of the brain is so far exhausted as of itself to threaten the total abolition of its functions; at another time the arterial action or the venous congestion is so great as to threaten an immediate effusion of serum or a large extravasation of blood. For states so opposite, opposite remedies must of course be required; but the difficulty at all times is to interpret the outward signs aright. If, together with the premonitory symptoms which have been enumerated, namely, drowsiness, giddiness, headache, and so on, there be a flushed countenance, a dull or suffused eye, a hot skin, a strong or full pulse, the abstraction of blood may be indispensable to the preservation of life; but if, on the other hand, the countenance be pallid and sunk, the pulse full, and the skin cool, the smallest blood-letting may utterly exhaust the vital energies of a brain already greatly depressed,

and the only chance of averting death may be the judicious employment of stimulating remedies. It is in clearly pointing out distinctions like these, and in guiding to the selection of the remedy appropriate to each, that science is the salvation of life. But such too are precisely the cases in which no skill on the part of the physician can succeed without the steady co-operation of the patient. The physician duly weighing the premonitory signs may foresee the impending danger, and give warning of it, and prescribe precisely the medicine and regimen fitted to avert it; but if these are either altogether neglected or only partially followed, the disease will hold on its course and life be lost. And this loss of life is deplorably frequent from the neglect on the part of the patient of the appropriate remedies in the primary stage of the disease, when such remedies may be employed with almost certain success; and the same is true from the neglect of such remedies in the stage subsequent to an apoplectic paroxysm, although in this stage the best-concerted measures have a much less chance of securing their object.

For the same reason that it would be vain to attempt here to enter into the modifications of treatment required in the premonitory and the consecutive stages of the disease, it would be out of place to discuss the measures proper to be adopted in the paroxysm itself. The state both of the brain and of the system varies in every individual case, and safe, not to say successful treatment, must in every case be modified accordingly. It is only necessary to add here, that whenever a person is seized with a fit of apoplexy, he should be carried into a large room, the freest possible circulation of fresh air should be promoted around the body, which should be placed in the horizontal posture, with the head, however, considerably raised, all bandages should be taken from about the head and neck, and especially from about the neck; and a medical man should be sent for instantly. Every observer of such a case should bear in mind that the loss of life may be the consequence of the loss of a minute.

APOPHYGE, a term applied by architects, generally, to a concave surface lying between or connecting two flat surfaces not in the same plane, and particularly to a slight concavity which is almost invariably found to terminate the shaft of an Ionic or Corinthian column both above and below;—immediately above the uppermost fillet of the congeries of mouldings called the base, and under the moulding or mouldings of the hypotrachelium or necking. In the latter case the apophyge is distinguished in the two positions as the lower and the upper. The more familiar English term for the same thing is, the *escape*; and in French, the apophyge is termed the *congé*. Apophyge is from a compound Greek word signifying a *flying off*.

A POSTERIO'RI. [See **A PRIORI.**]

APOSTLES (ἀπόστολοι, messengers, ambassadors, missionaries) were, according to Luke vi. 13, those twelve disciples whom Jesus chose from the number of his followers to be his companions, and whom he commissioned to preach his doctrines, first among the Jews only (Matt. x. 5; Luke ix. 2), and after his resurrection to the Gentiles also (Matt. xxviii. 19; Mark xvi. 15). Jesus said concerning apostles, 'As my Father hath sent me, even so send I you. He breathed on them and said, Receive the Holy Ghost. Whosoever sins ye remit, they are remitted unto them, and whosoever sins ye retain, they are retained' (John xx. 21-23). The list of the apostles occurs Matt. x. 2; Mark iii. 16, &c.; Luke vi. 14, &c. The names of the apostles are, 'Simon, who is called Peter, and Andrew, his brother; James, the son of Zebedee, and John, his brother; Philip and Bartholomew; Thomas, and Matthew, the publican; James, the son of Alphaeus; and Lebbeus, whose surname was Thaddeus; Simon, the Canaanite; and Judas Iscariot, who also betrayed him.' After the death of Judas Iscariot, 120 disciples being assembled, Peter recommended the choice of another apostle. 'Of these men which have companied with us all the time that the Lord Jesus went in and out among us, beginning from the baptism of John, unto that same day that he was taken up from us, must one be ordained to be a witness with us of his resurrection. And they appointed two, Joseph, called Barsabas, who was surnamed Justus, and Matthias. And they prayed, Thou, Lord, which knowest the hearts of all men, show whether of these two thou hast chosen, that he may take part of this ministry and apostleship, from which Judas by transgression fell, that he might go to his own place. And they gave forth

their lots; and the lot fell upon Matthias, and he was numbered with the eleven apostles' (Acts i. 15-26). To these twelve apostles was afterwards added Saul, whose name among the Greeks was Paul, called to be an apostle of the Gentiles through the will of God (Gal. i. 1; Col. i. 1; Rom. xi. 13; Acts ix.). By the instrumentality of St. Paul the Gospel was most effectually propagated. Barnabas (Acts xiv. 14) being an apostolic missionary is mentioned in the following manner: 'And when the apostles Barnabas and Paul heard, &c. From this passage we infer that the title *apostle* was not exclusively given to the immediate disciples of Jesus. Comp. Acts xiv. 4; Rom. xvi. 7.

APOSTLES, ACTS OF THE. The authenticity of this book has not been doubted: it constitutes the second part of the Gospel according to St. Luke, which he dedicated to Theophilus (Luke i. 1; Acts i. 1). The Acts belong to the *Homologoumena*, or those canonical books which were, by all parties, recognized as genuine (Euseb. *Hist. Ecclesiastica*, iii. 25). The Severians (Eusebii, *Hist. Eccles.* iv. 29) and the Manichæans (Augustin. *Epist.* 23) acknowledged the authenticity of the Acts, although they rejected, for doctrinal reasons, their authority. Although the authenticity of the Acts was well established, they were less read among the lower classes, and accordingly Chrysostomus, at the end of the fourth century, wrote at the commencement of his *Commentary to the Acts*—'Many do not know even the existence of this little book, nor him who wrote and composed it.'

The time at which St. Luke wrote the Acts may be gathered from the following circumstances. The arrival of St. Paul in Rome took place in the spring of about the year A.D. 63. Since this arrival is mentioned in the Acts, they must have been written after the year 63; and since the death of St. Paul, about the year 68 or 69 is not mentioned by St. Luke, the Acts were probably composed and circulated before this date. Theophilus, to whom the Acts were dedicated, may be considered as the representative of the inquiring heathen; consequently, it was proper that the Acts should be written, as they are, in the Greek language.

The interpretations of the Acts by Clemens Alexandrinus in the *Hypotyposes*, and the commentaries of Origen, Didorus of Tarsus, Theodorus of Mopsuestia, have been lost. The *Fifty-five Homilies* of St. Chrysostomus on the Acts are still extant. There exist commentaries by Eusebius and Theophylactus. In the works of Grotius, Wolf, and others, on the *New Testament*, the Acts also have been explained. Limborch published his great work on the Acts at Rotterdam, 1711; and Walsh his *Dissertationes in Acta Apostolorum* at Jena, 1756-1761, 3 vols. Besides these the following commentators may be mentioned: Morus, ed. Dindorf, Lips. 1794, 2 vols.; Thies, *Uebersetzung mit Anmerkungen*, Lips. 1800; Heinrich's *Acta Apostolorum, Annotationes perpetua illustrata*, Göttingæ, 1809; Krieger, Lips. 1818. Stier has written a work on the speeches contained in the Acts, (*Ueber die Reden in der Apostelgeschichte*, 2 vols. Lips. 1829, 1830.) The author endeavours to show the logical arrangement in these speeches. *Die Apostelgeschichte von Lucas erläutert von Michael Wirth*, 2 vols. 8vo. Ulm, 1831-32. 8vo. That Matthew Henry, Wesley, Dodd, Coke, Scott, Benson, Adam Clarke, and other English commentators of the whole Bible, or of the New Testament, have not omitted the Acts, is generally known.

According to Sanelemente and Ideler, the dates in the Acts are as follows:—Stephen was stoned A.D. 35. Paul converted between 35 and 38. St. Paul's first journey to Jerusalem (Act ix. and Gal. i. 18) between 38 and 41. The second journey (Acts xi. 12) in the year 44. The third journey (Acts xv.) in the year 52. The fourth journey (Acts xviii. 22) in the year 56. The fifth journey to Jerusalem and captivity of St. Paul in the year 60. Voyage to Rome, 62. Arrival in Rome in the spring of A.D. 63.

APOSTOLIC FATHERS, are those teachers of the Christian church who distinguished themselves during the first two centuries, and derived their Christian knowledge from personal acquaintance with the apostles. [See **CLIMENS ROMANUS**, **IGNATIUS** of Antiochia, **POLYCARPUS**, **HERMAS**, **BARNABAS**.]

APOSTOLICI, were imitators of the apostolic life mentioned by Epiphanius. (Hæres, 67.) In the middle ages they were called Cathari. Some of them indulged Manichæan speculations, and others distinguished themselves only by

their obedience to the moral doctrine of the *New Testament*. The latter, called Apostolic Brothers, were very numerous on the banks of the Lower Rhine, about the middle of the twelfth century. We learn from a letter written A.D. 1146, in which Everwin, ecclesiastical provost of Steinfeld, exhorts St. Bernhard, of Clairvaux, to confute these heretics, that they rejected oaths, infant baptism, fasts, ceremonies, worship of saints, purgatory, masses, second marriages, the power of the pope, &c. Some of them were brought before the ecclesiastical court of the archbishop of Cologne, and defended themselves by biblical quotations. After a disputation of three days, being still unconverted, the people dragged them to the flames, in which they died manfully.

Another apostolic brotherhood was founded by Gerhard Segarelli of Parma about A.D. 1260. This brotherhood Pope Nicolas IV. endeavoured to suppress by various decrees of 1286 and 1290. Nevertheless Segarelli and his adherents spread through Italy, Germany, France, and Spain. They went about accompanied by women singing, and preaching especially against the corruptions of the clergy. In 1294, two brothers and two sisters were burnt alive at Parma. Segarelli abjured his heresy, but was burnt in 1300 for having relapsed. From this time Dolcino of Milan became the head of this party, who predicted the sudden downfall of the Romish church. Dolcino divided the development of Christianity into four dispensations, the last of which began with his apostolic order. Dolcino escaped from the inquisitors into Dalmatia, but returned to Italy in 1304. He fortified, with 1400 followers, a mountain in the diocese of Novara, near the village Balmara, and plundered, for his support, the adjacent country. In 1306 he fortified the mountain Zebello in the diocese of Vercelli, and fought against the troops of the bishop, until he was compelled by famine to surrender in 1307. Dolcino and his companion Margaretha of Trent were burnt with many of their followers. These Apostolici rejected the authority of the Pope, oaths, capital punishments, &c. Some Apostolic Brothers are mentioned A.D. 1311, near Spoleto; and A.D. 1320, in the south of France. The synod of Lavaur, 1368, mentions them for the last time.

APOSTROPHE (ἀποστροφή). A turning away, a sudden change in our discourse, when, without giving previous notice, we address ourselves to a person or thing different from that to which we were addressing ourselves before. (Beattie, *Elements of Moral Science*.) The term is also used, less properly, for an address to some absent or inanimate object, as in *Julus Cæsar*, Act iii. Sc. I.

O pardon me, thou bleeding piece of earth,
That I am meek and gentle with these butchers.

It is also used to express the contraction or division of part of a word, as *boro* for *borough*, *learn'd* for *learned*. This practice of division, intolerable in a language already overburdened with consonants, was much more frequent in the writers of a century, or a century and a half ago, than now; and seems to have been affected to give an air of negligence and familiarity to their style. It ought seldom to be used except in verse, and very sparingly there. The comma, by which the final *s* of the genitive case is separated from the word, is also called an apostrophe, as in 'Israel's monarch.'

APOTACTITES. [See **HERETICS.**]

APOTHECARIES (COMPANY OF), one of the incorporations of the city of London. In England, in former times, an apothecary appears to have been the common name for a general practitioner of medicine, a chief part of whose business it was, probably in all cases, to keep a shop for the sale of medicines. In 1345, a person of the name of Coursus de Gangeland, on whom Edward III. then settled a pension of sixpence a day for life, for his attendance on his Majesty some time before while he lay sick in Scotland, is called in the grant, printed in Rymer's *Fœdera*, an apothecary of London. But at this date, and for a long time after, the profession of physic was entirely unregulated. [It was not till after the accession of Henry VIII. that the different branches of the profession came to be distinguished, and that each had its province and particular privileges assigned to it by the law. An act of parliament was passed in the third year of that king (1511), by which, in consideration, as it is stated, of 'the great inconvenience which did ensue by ignorant persons practising physic or surgery, or the grievous hurt, damage, and destruction of many of the king's liege people, it was ordered that no one should practise as surgeon or physician in the city of London, or

within seven miles of it, until he had been first examined, approved, and admitted by the Bishop of London, or the Dean of St. Paul's, who were to call in to assist them in the examination 'four doctors of physic, and of surgery other expert persons in that faculty.' In 1518, the physicians were for the first time incorporated, and their college founded, evidently with the view that it should exercise a general superintendence and authority over all the branches of the profession. In 1540, the surgeons were also incorporated, and united, as they continued to be till the beginning of the present century, with the barbers. The two associations thus established appear, however, to have very soon begun to overstep their jurisdiction. It was found necessary, in 1543, to pass an act for the toleration and protection of the numerous irregular practitioners, who did not belong to either body, but who probably formed the ordinary professors of the healing art throughout the kingdom. In this curious statute, the former act of 1511 is declared to have been passed, 'amongst other things, for the avoiding of sorceries, witchcraft, and other inconveniences;' and not a little censure is directed against the licensed and associated surgeons for the mercenary spirit in which they are alleged to have acted, while much praise is bestowed upon the unincorporated practitioners for their charity in giving the poor the benefit of their skill and care, and for the great public usefulness of their labours generally. The import of the enactment is expressed in its title, which is, 'An Act that persons being no common surgeons may minister outward medicines.' The persons thus tolerated in the administration of outward medicines, of course comprehended those who kept shops for the sale of drugs, to whom the name of apothecaries was now exclusively applied. The acceptance of the name, as thus confined, may be gathered from Shakspeare's delineation of the apothecary in *Romeo and Juliet* (published in 1596 or 1597), as one whose business was 'culling of simples,' who kept a 'shop,' the 'shelves' of which were filled with 'green earthen pots,' &c., and who was resorted to as a dealer in all sorts of chemical preparations. Nothing is said of his practising medicine; and it certainly was not till nearly a century later that apothecaries in England, as distinguished from physicians and surgeons, ever began to act as general practitioners.

Meanwhile, however, the apothecaries of London were incorporated by James I. on the 9th of April, 1606, and united with the Company of Grocers. They remained thus united till the 6th of December, 1617, when they received a new charter, forming them into a separate company, under the designation of the Master, Wardens, and Society of the Art and Mystery of Apothecaries of the City of London. This is the charter which still constitutes them one of the city companies, although various subsequent acts of parliament have materially changed the character of the society.

It appears to have been only a few years before the close of the seventeenth century, that the apothecaries, at least in London and its neighbourhood, began generally to prescribe, as well as to dispense, medicines. This encroachment was strongly resisted by the College of Physicians, who, by way of retaliation, established a dispensary for the sale of medicines to the poor at prime cost at their hall in Warwick Lane. A paper controversy of great animation rose out of this measure; but the numerous tracts which were issued on both sides are now all forgotten, with the exception of Garth's burlesque epic poem, entitled *The Dispensary*, first published in 1697. The apothecaries, however, may be considered as having made good the position they had taken; although for a considerable time their pretensions continued to be looked upon as of a somewhat equivocal character. Addison, in the *Spectator*, No. 195, published in 1711, speaks of the apothecaries as the common medical attendants of the sick, and as performing the functions both of physician and surgeon. After mentioning blistering, cupping, bleeding, and the inward applications employed as expedients to make luxury consistent with health, he says, 'The apothecary is perpetually employed in countermining the cook and the vintner.' On the other hand, Pope in his *Essay on Criticism*, published the same year, has the following lines in illustration of the domination which he asserts to have been usurped by the critic over the poet—

'So modern 'pothecaries, taught the art
By doctors' bills to play the doctor's part;
Bold in the practice of mistaken rules,
Prescribe, apply, and call their masters' fools.'

Nor, indeed, did the apothecaries themselves contend at this time for permission to practise as medical advisers and

attendants any further than circumstances seemed to render it indispensable. In a cleverly written tract in their defence, published in 1724, and apparently the production of one of themselves, entitled '*Pharmacopolæ Justificati; or the Apothecaries Vindicated from the Imputation of Ignorance, wherein is shown that an academical education is nowise necessary to qualify a man for the practice of physic*,' we find the following opinion expressed (p. 31), 'As to apothecaries practising, the miserable state of the sick poor, till some other provision is made for their relief, seems sufficiently to warrant it, so long as it is confined to them.' We may here observe, that the custom of persons being licensed by the bishops to practise medicine within their dioceses continued to subsist at least to about the middle of the last century. It is exclaimed against as a great abuse in a tract entitled *An Address to the College of Physicians*, published in 1747.

It has been stated in various publications, that the order of dealers in medicines, known as chemists or druggists, first made their appearance about the end of the last century, or not much more than forty years ago. 'As they immediately, or at least very soon, began to prescribe as well as to dispense, the rivalry with which they were thus met was as eagerly opposed by the regular apothecaries, as their own encroachments had in the first instance been by the physicians. In certain resolutions passed by a meeting of members of the Apothecaries' Company on the 20th of November, 1812, among other causes which are asserted to have of late years contributed to degrade the profession, is mentioned the intrusion of pretenders of every description:—'Even druggists,' it is said, 'and their hired assistants, visit and administer to the sick; their shops are accommodated with what are denominated private surgeries; and, as an additional proof of their presumption, instances are recorded of their giving evidence on questions of forensic medicine of the highest and most serious import!' But in all this the druggists really did no more than the apothecaries themselves had begun to do a hundred years before. We doubt, too, if the first appearance of these interlopers was so recent as has been assumed. We find a tract, printed on a single folio leaf 'at the Star in Bow Lane in 1683,' entitled *A Plea for the Chemists or Non-Collegiate*, in which the author, Nat Merry, stoutly defends the right of himself and the other manufacturers of chemical preparations to administer medicines, against the objections of the members of the Apothecaries' Company, who seem to have been themselves at this time only beginning to act as general practitioners. And in 1708, we find a series of resolutions published by the Court of Apothecaries, in which they complain of the intrusion into their business of foreigners—that is, of persons not free of the company. Their charter, though it appeared to bestow upon them somewhat extensive privileges, had been found nearly inoperative from the omission of any means of executing its provisions, and of any penalties for their infringement. In 1722, therefore, an act of parliament was obtained by the company, giving them the right of visiting all shops in which medicinal preparations were sold in London, or within seven miles of it, and of destroying such drugs as they might find unfit for use. This act expired in 1729; and although an attempt was made to obtain a renewal of it, the application was not persevered in. But in 1748 another act was passed, empowering the society to appoint ten of their members to form a court of examiners, without whose license no one should be allowed to utter medicines in London, or within seven miles of it. It was stated before a Committee of the House of Commons, that there were at this time about 700 persons who kept apothecaries shops in London, not one-half of whom were free of the company. But this act probably had the effect of putting the unlicensed dealers down; which may account for the common statement, that no such description of dealers ever made their appearance till a comparatively recent period. In an Introductory Essay prefixed to the first volume of the *Transactions of the Associated Apothecaries and Surgeon Apothecaries of England and Wales* (8vo., London, 1823), in which it is admitted that antiently 'the apothecary held the same situation which appertains, or ought to appertain, to the present druggist, who arose,' it is affirmed, 'about thirty years ago,' the following remark is added, 'For some time previous to that period, indeed, certain apothecaries existed who purely kept shop, without prescribing for diseases; but very few of these existed even in London; for in the memory of a physician lately dead, there

were not more, as he stated, than about half-a-dozen persons in London who kept what could be called a druggist's shop.'

Up to within the last few years the Company of Apothecaries had never attempted to extend their jurisdiction beyond the metropolis and its immediate neighbourhood. But in 1815, an act of parliament was passed, which placed the society in altogether a new position, by giving to the Court of Examiners, then increased to twelve members, the sole right of examining and licensing apothecaries throughout England and Wales. It was enacted, that after the 1st of August in that year, no person not so licensed should practise as an apothecary, 'except such only as were already in practice. It was also made imperative that candidates for examination should have previously served an apprenticeship of at least five years with a member of the company.'

The history of the steps taken to procure this act is very minutely detailed in the Essay prefixed to the *Transactions of the Associated Apothecaries and Surgeons*, already referred to. The application was commenced, and indeed principally carried through, by this private society; the Colleges of Physicians and Surgeons, and the Apothecaries' Company themselves, having declined joining in it. The act, however, fell in one material respect very far short of the design entertained by its projectors, inasmuch as the opposition of the chemists and druggists rendered it necessary to introduce a clause into it exempting that class of dealers altogether from its operation.

From the circumstance that in country places, with very few exceptions, no person can practise medicine without keeping a supply of drugs for the use of his patients, or in other words, acting as an apothecary, this statute has given to the Society of Apothecaries the complete control of the medical profession throughout England. Every general practitioner must not only have purchased their license, but must have served a long apprenticeship with a member of the company. The price of a license to practise in London or within ten miles of it, is ten guineas, and in any other part of the country six guineas. The penalty for practising without this license is twenty pounds. It is expressly declared in the act that the society may appropriate the moneys which they thus receive in any way they may deem expedient. It appears by a published list, that from the 1st August, 1818, when the new act came into operation, to the 31st July, 1832, about 1600 practitioners had been licensed by the Court of Examiners. We have not been able to find any account of the number of rejected applicants. From a return, printed by order of the House of Commons last session, it appears that from the 29th March, 1825, to the 19th June, 1833, the money received by the company for certificates was 22,822*l.* 16*s.* Of this, in the course of the eight years, 10,218*l.* 12*s.* had been paid to the members of the Court of Examiners, besides 980*l.* to their secretary.

It is right to state that the parties by whom the act was sought did not originally contemplate the giving of these extensive powers to the Apothecaries' Company. In one of their first reports, dated the 5th of December, 1812, the committee of management express themselves as of opinion 'that the management of the sick should be as much as possible under the superintendence of the physician;' and it was then proposed that a new and a distinct privileged body should be created to examine and license practitioners, composed of members of all the different branches of the profession. This scheme, however, was abandoned when both the Colleges of Physicians and Surgeons refused to co-operate in getting it carried into effect.

Before this act came into operation a large proportion of the medical practitioners in country places throughout England were graduates of the Universities of Edinburgh, Glasgow, and Dublin, or licentiates of the Royal Colleges of Surgeons of these cities, or of that of London, none of whom obtained their degrees or certificates without passing through a long course of study and a rigorous examination. Persons thus qualified are admitted as surgeons in the army and navy, and into the service of the East India Company; but they are no longer allowed to act as country practitioners in England. This privilege can only be obtained by a service of five years in the shop of a practitioner who is a member of the Company of Apothecaries, and by undergoing an examination in London before the Court of Examiners.

Except in regard to experience in the compounding of medicines, it is not denied that, until very lately, the course

of education prescribed by the Company's Court of Examiners was of an extremely inferior description. For this we have their own avowal. In their regulations, dated August 1832 (the last issued, we believe), referring to the improved system which had been introduced only the preceding year, they say, 'The medical education of the apothecary was heretofore conducted in the most desultory manner; no systematic course of study was enjoined by authority or established by usage, some subjects were attended to superficially, and others of great importance were neglected altogether.' In fact, all the attendance upon lectures and hospital practice that was demanded, might have been and often was gone through in six or at most in eight months. The court admits that still 'the attendance upon lectures, but more especially upon the hospital practice, is often grossly eluded or neglected.'

The course prescribed in 1832 for those whose attendance on lectures had commenced on or after January in the preceding year, comprehends two courses of chemistry, two of *materia medica* and therapeutics, two of anatomy and physiology, two of anatomical demonstrations, two of the principles and the practice of medicine, two of midwifery and the diseases of women and children, one of botany, and one of forensic medicine; together with twelve months' attendance on clinical lectures in an hospital. Most of these courses are to comprehend at least forty-five lectures; and the whole, with the hospital attendance, are to occupy two years.

Notwithstanding this reform, a strong feeling of dissatisfaction has continued to prevail in many quarters at the exclusion from the right to practise of all persons except those who have served an apprenticeship of five years with an apothecary; and a bill was last session brought into the House of Commons to remove this disability. It was withdrawn in consequence of some difference of views as to a minor point among the parties by whom it was promoted; but it is understood that it will be again brought forward during the present session (1834). The object was not to take the right of examination and license from the Court of Examiners of the Apothecaries, but to permit the licentiates of the Scotch and Irish universities, and of the Colleges of Surgeons, to practise in England, as well as those who have the diploma of the Apothecaries' Company.

In respect to this proposed reform, we have only to observe, that the legislature cannot make any change in the present state of the law which regulates the practice of apothecaries in England without a full and impartial inquiry. Whatever may be the result of this, we believe it will be shown that the examinations of the court have been progressively improving, and that the attainments of the successful candidates are very much higher than those possessed by medical practitioners at the time of passing the act of 1813, and indeed than those required by the society soon after the act came into operation. That the examination is not a mere matter of form is shown by the number of pupils rejected: out of the 6227 who were examined from 1815 to 1831 inclusive, 680 were rejected by the court. In the year 1831-1832, nearly one-sixth, and in the year 1830-1831, nearly one-fourth, of the candidates were rejected. The rejected candidates no doubt frequently obtain their diplomas at a subsequent examination, after preparing themselves better; but the fact of so many being rejected is creditable to the Court of Examiners, as, in the present defective state of the early education of medical students, every body knows that a large number of them cannot possibly pass a satisfactory examination. No fees are paid by the rejected candidates. (See *A Reply to the Statement in Support of a Petition of the Royal College of Surgeons of Edinburgh*.)

We ought not to omit to mention that the Apothecaries' Society, in their interpretation of the clause which requires five years' apprenticeship to an apothecary, have considered that 'every candidate who has been an apprentice for the length of time directed by the act, is entitled to be examined, provided the person to whom he was an apprentice was legally qualified to practise as an apothecary according to the laws in force in that kingdom or particular district in which he resided: and in accordance with this interpretation, hundreds of candidates have been admitted to examination who have served their apprenticeships in Scotland and Ireland, as well as many from America and the British colonies.' (See *Reply*, &c. p. 3.) Of twenty-four graduates and licentiates of the Scottish colleges who presented themselves for examination before the Society of

Apothecaries during the twelve months ending the 25th of April, 1833, eight candidates, or one third of the whole number, were rejected. (*Reply*, &c.) The whole subject of medical education in these kingdoms requires a complete and impartial investigation; and that the apprentice clause in particular demands a fresh consideration, is now a pretty general opinion. The admission of graduates from Scotland and Ireland to an equal participation of practice with the English general practitioner, can only be regarded as a very partial measure of reform, if reform should be found necessary; and the interests of the public require, that, if others than those licensed by the Apothecaries' Society are admitted to general practice in England, there shall at least be good proof that they are as well qualified as those who obtain the apothecaries' diploma.

The Apothecaries rank as the fifty-eighth in the list of City companies. The members of the society are exempted by statute from serving ward and parish offices. Their arms are, azure, Apollo in his glory, holding in his left hand a bow, in his right an arrow, bestriding the serpent Python; supporters, two unicorns; crest, a rhinoceros, all or; motto, *Opiferque per orbem dicor*. They have a hall in Water-lane, Blackfriars, at which medicines are sold to the public; and where all the medicines are prepared that are used in the army and navy. They also possess a garden, to which every medical student in London is admitted, of above three acres in extent, at Chelsea, in which exotic plants are cultivated. The ground was originally devised to them, in 1673, for sixty-one years at a rent of five pounds, by Charles Cheyne, Esq., lord of the manor of Chelsea, and afterwards granted to them in perpetuity, in 1721, by his successor Sir Hans Sloane, on condition that they should annually present to the Royal Society, at one of their public meetings, eighty specimens or samples of different sorts of plants, well-cured and of the growth of the garden, till the number should amount to two thousand. This they have done, and the specimens are preserved by the Royal Society. They still observe an old custom of making every summer a number of *herbarizing* or *simpling* excursions to the country, which are now, we believe, so conducted as to be valuable botanical lessons to the apprentices or pupils by whom the members of the society are accompanied on these occasions. The society gives every year a gold and a silver medal to the best-informed students in botany, who have attended their garden. The apprentices of members of the society are not permitted to contend with other candidates for these prizes.

APOTHEOSIS (*ἀποθεωσις*, a deification, literally, a god-making), the enrolment of a mortal among the Gods. The mythology of Greece is full of instances of this: it is sufficient to call to mind Minos, Hercules, and other heroes, who received divine honours. It was one of the doctrines of Pythagoras, that good men after death were raised into the order of gods. To exalt fellow-men to this extent, however, was foreign to the disposition of republican states; and, therefore, though the Greeks always held in high respect the heroes of ancient times, we hear of no deifications from the time when a republican form of government became prevalent in Greece, until the spirit of independence was broken, and the Greeks became as obsequious to kings and princes, as they had formerly been unbending. There is, however, an example to the contrary recorded by Herodotus (v. 47):—the people of Egæstæ built an *heroum* to Philippus, though he fell in battle against them, and offered sacrifices to him, as Herodotus himself testifies; it was on account of his *beauty* that he was deified. Alexander, according to some rather doubtful stories, not only claimed divine parentage, but a divine nature while on earth; and the compliment of deification was commonly paid to the princes of the various dynasties who succeeded to his empire. On the coins of the Seleucidæ we often find the word 'God' (*Θεός*). In Rome, also, we find Romulus raised to the rank of a god; but there are no instances of Romans admitted to the rank of deity, from the expulsion of Tarquin, until the empire of the Cæsars. Julius Cæsar was worshipped as a god after his murder. Augustus, while yet alive, was declared the tutelary god of all the cities of the empire, and the succeeding emperors after death were enrolled among the numerous tenants of heaven. It is to the death and reception of Julius Cæsar into heaven, that the 5th *Eclogue* of Virgil is by some supposed to refer.

The term *Apotheosis*, however, is more especially used to signify the ceremony by which the Roman emperors were

admitted, if we may use the expression, after death to divine honours. This is minutely described by Herodian (*lib. iv. c. 3.*), and the passage presents so curious a picture of the absurdities into which an idolatrous religion betrayed its votaries, that we translate it here. 'It is the custom of the Romans to deify those of their emperors who die, leaving successors; and this rite they call *apotheosis*. On this occasion, a semblance of mourning, combined with festival and religious observances, is visible throughout the city. The body of the dead they honour after human fashion, with a splendid funeral; and making a waxen image in all respects resembling him, they expose it to view in the vestibule of the palace, on a lofty ivory couch of great size, spread with cloth of gold. The figure is made pallid, like a sick man. During most of the day senators sit round the bed on the left side, clothed in black; and noble women on the right, clothed in plain white garments, like mourners, wearing no gold or necklaces. These ceremonies continue for seven days; and the physicians severally approach the couch, and looking on the sick man, say that he grows worse and worse. And when they have made believe that he is dead (*ἐπὶ δὲ δόξῃ τετελευτηῖναι*), the noblest of the equestrian and chosen youths of the senatorial orders take up the couch, and bear it along the Via Sacra, and expose it in the old forum. Platforms like steps are built on either side; on one of which stands a chorus of noble youths, and on the opposite, a chorus of women of high rank, which sing hymns and songs of praise (*ὕμνους καὶ παιάνας*) to the deceased, modulated in a solemn and mournful strain. Afterwards they bear the couch through the city to the Campus Martius; in the broadest part of which, a square pile is constructed entirely of logs of timber of the largest size, in the shape of a chamber, filled with faggots, and on the outside adorned with hangings interwoven with gold and ivory images and pictures. Upon this, a similar, but smaller chamber is built, with open doors and windows, and above it, a third and fourth, still diminishing to the top, so that one might compare it to the light houses, which are called *Phari*. In the second story they place a bed, and collect all sorts of aromatics and incense; and every sort of fragrant fruit or herb or juice; for all cities and nations and persons of eminence, emulate each other in contributing these last gifts in honour of the emperor. And when a vast heap of aromatics is collected, there is a procession of horsemen and of chariots around the pile, with the drivers clothed in robes of office, and wearing masks made to resemble the most distinguished Roman generals and emperors. When all this is done, the successor to the empire applies a torch to the building; and others set fire to it on every side, which easily catches hold of the faggots and aromatics. And from the highest and smallest story, as from a pinnacle, an eagle is let loose to mount into the sky as the fire ascends; which is believed by the Romans to carry the soul of the emperor from earth to heaven: and from that time he is worshipped with the other gods.' Compare with this description Dion's account (book 74.) of the funeral ceremonies of Pertinax.

In conformity with this practice, it is common to see on medals struck in honour of an apotheosis, an altar with fire on it, and an eagle taking its flight into the air. Several representations of real or supposed apotheoses have been preserved in antient gems and sculptures; of which the most celebrated is the apotheosis of Homer, formerly in the Colonna palace at Rome, but now in the Townley gallery of the British Museum. This monument has been illustrated by some of the most eminent of modern scholars. Montfaucon has published the apotheosis of Romulus in the third volume of the supplement to his *Antiquities*. See a remark on the apotheosis of Augustus, under *onyx*, in the article AGATE.

APOTOME, in antient Greek music (from *ἀπό*, *from*, and *τέμνω*, *to cut*), the remainder of a whole tone when diminished by a *limma* [see LIMMA], or smaller semitone, the ratios being 2187 and 2048. The Greeks were aware that the tone-major could not be rationally divided into two equal parts; they therefore divided it into a greater and less semitone, which they called *apotome* and *limma*, the difference whereof is a *comma*. [See COMMA.] Under the heads TONE, and SCALE, MUSICAL, OF THE GREEKS, will be found further information concerning the antient manner of dividing the octave.

APPALACHE, a bay in the Gulf of Mexico, formed by the coast of West Florida, and a line joining Cape St.

George, the most southern point of the Appalachicola delta, with the outlet of the Suwanne river. It receives the Ocklockonne, St. Mark's, and a few other inconsiderable streams.

APPALACHIAN MOUNTAINS. The mountain system which runs along the eastern side of the continent of North America, is generally known, in this country, by the name of the Alleghanies: but these are, in fact, only a subordinate chain; and modern geographers in the United States have adopted the general term of the *Appalachian System* for the whole mass. They were called the *Appalaches*, or Appalachian Mountains, by the French, who first became acquainted with them at their southern extremity, from the Indian name of a river which flows into the Gulf of Mexico, in Appalache bay; but the English, who visited them principally in their more northern parts, preserved the Indian name there given of Alleghanies, which is supposed to mean the *Endless*.

The Appalachian system consists of numerous parallel chains, some of which form detached ridges, extending, in most instances, in the same direction as the entire system which they contribute to form. Taken as a whole, it has a range which does not deviate materially from N.E. to S.W., and it extends about 1200 miles in length. The northern and southern extremities of this mountain system are not well defined, but the elevations which form a part of the whole system may be traced from the state of Maine into Alabama. The most remarkable chains are, the Blue Ridge, which lies nearest to the Atlantic, and stretches from the state of Georgia to its intersection by the Delaware River, but no very exact limit to the name of this range is laid down; the Kittatinny Chain; the Alleghany Mountains, in the western part of Virginia and the central parts of Pennsylvania; the Cumberland Mountains, on the eastern boundary of Tennessee and Kentucky; the Catsbergs, or Catskill Mountains, in the state of New York; the Sacandago Chain, which is a continuation of the Catsbergs; the Green Mountains, in the state of Vermont; the Highlands, eastward of the Hudson River; and the White Hills in New Hampshire. In the whole of the Appalachian system, there are no great detached mountain peaks; the greatest elevations are in the White Hills of New Hampshire, where Mount Washington, according to the measurements of Captain Partridge, rises to the height of 6634 feet above the sea, its base being at an elevation of 1888. The summit is much below the limit of perpetual snow. Mooschillock, another of the White Hills, is 4636, and Grand Monadnock, 3244 feet. In the Green Mountains, Killington Peak is 3914 feet above the sea; in the Catsbergs, Round Top is 3884, and the High Peak 3718 feet above the tide level of the Hudson, about 18 miles distant. The Peaks of Otter, in the Blue Ridge, Virginia, are said to be about 4000 feet above the sea level; though the general elevation of the Blue Ridge in Virginia is far below this height. Table Mountain, in South Carolina, is supposed to be not less than 4300 feet above the sea. Canawhee Mountain in Georgia, the southern extremity of the Blue Ridge, is 1500 feet.

The Appalachian Mountains do not form a high dividing line between the waters which flow into the Atlantic on one side, and into the Mississippi on the other. They cover a widely-extended area of about 100 miles in breadth, only one-third of which is occupied by the mountain chains, the rest being the intermediate valleys. The rivers which rise in the Appalachians, flow in long valleys between the chains, and are deflected sometimes to the east, and sometimes to the west, after passing nearly at right angles through depressions in the ridges, or through deep rents in the mountains, as at Harper's Ferry, in Virginia, where the united Potomac and Shenandoah cut the Blue Ridge at right angles. From the Connecticut River, the most northern of the great rivers belonging to the Appalachian system, to the Alabama of Georgia, we find a series of large rivers which, originating within the Appalachian system, or on the margin of its eastern barrier, flow to the Atlantic. The line of the great water-shed, between the streams that run to the Atlantic, and those that flow into the gulf of Mexico, runs from the sources of St. John's River, on the north-western limit of the state of Maine, to the Point of Florida, almost following the inflection of the coast, but the mountain system crosses that line, at an angle of about 36°. The land between the sea-coast and the foot of the most eastern of the Appalachian chains, is of very unequal breadth; at

the Hudson River, the Atlantic almost washes the base of the mountains, but from that point southward, there is a gradual increase in the breadth of the Atlantic Slope, as it is called by the American geographers, as far as Cape Hatteras, in North Carolina, and from that point to the mouth of the Alatomaha in Georgia, the coast runs nearly parallel to the mountains, at a distance of about two hundred miles.

The western slope of the Appalachian system falls by a gentle but broken descent to the Mississippi; it is upwards of 1000 miles in length, and about 300 miles in width, from the river to the base of the mountains, covering an area of about 300,000 square miles, unbroken by any other than gently rising hills, but deeply furrowed by rivers over its whole surface. Nowhere can the wearing effects of rivers be more advantageously studied, for their channels do not appear to have been formed by rents and dislocations of the ground, the strata being usually horizontal, but by the erosion of a stream. The hills parallel to the Appalachian system on the western slope consist, in their lower parts, of transition slate and limestone, in highly inclined beds, which are covered near their summits by coal-measures and superior secondary formations, in unconformable and horizontal stratification. Hills, separated by valleys several miles wide, are composed of the same horizontal strata, the identity of the beds on both sides of the valley being recognizable; it seems, therefore, a legitimate conclusion, that the strata were once continuous over the valley, and it is difficult to conceive how the gap could have been produced, in such circumstances, except by the scooping out of water acting with great force, and for a considerable period. Further observation, however, should be made before any positive opinion is adopted about the formation of these river valleys.

In the northern parts of the Appalachian system, a considerable tract of country is occupied by primary strata, such as gneiss, mica-slate, clay-slate, and granular limestone, associated with granites, serpentines, and traps, under various aspects, underlying and penetrating the strata. Grauwacke sandstone and slates, and transition limestones, are, however, more abundant in this mountainous range than the primary strata. *Grauwacke slate* forms the western margin of the primary country of New York and New England, and also of the great body of the Alleghany Mountains and of the Catsbergs. It is still more widely extended in the north, occupying much of the surface in the state of Vermont, the northern parts of the state of New York, and Canada. In the Alleghany Mountains of Pennsylvania, Maryland, and Virginia, its beds are of great thickness, and form, in some instances, the prevailing rocks, being, however, almost invariably overlaid by sandstone. *Transition limestone* occurs over a great extent of country along the north-western side of the Alleghany chain, associated with the grauwacke slate, but generally inferior to it. It is found in Vermont alternating with grauwacke slate, and is separated from a secondary limestone in the valley of Lake Champlain by a red sandstone, which forms the upper part of a range of hills called the Snake Mountain. In the western part of Massachusetts, and along the eastern side on the Hudson River in New York, it lies upon primary clay-slate. North-east of the Hudson, this limestone nowhere occupies any great extent of country. Crossing the Hudson, and proceeding south-west, little of this limestone is seen in the lower part of New York, but it becomes more abundant in the western parts of New Jersey and Pennsylvania, and forms the lower part of the ridge in southern Pennsylvania and Virginia. According to Maclure, it extends nearly to the south-west termination of the mountains, between the Alabama and Tombekbe rivers. It contains many caves, some of which are of great extent, and in these caves fossil bones of various animals have been found. *Arenaceous and conglomerate grauwackes* are perhaps the most frequent forms in which the transition rocks present themselves, but what proportion of these are of the age of our old red sandstone has not yet been made out. A red sandstone partially covers the lower levels of the primary strata, from twelve miles south of Connecticut River to near the Rappahannock River in Virginia, a range of nearly 400 miles; and, though often interrupted, it retains a remarkable degree of uniformity throughout the whole distance. The sandstones, in highly-inclined beds, prevail very generally throughout the middle and eastern chains in Pennsylvania and Maryland. Near the summit of the

Alleghany Mountains, the grauwacke passes into a red sandstone, which is not in unconformable stratification, but gradually assumes a horizontal position.

In Pennsylvania there is a vast deposit of coal, associated with sandstones and slates, which American geologists have hitherto described as belonging to the transition or grauwacke series. The coal is usually termed anthracite by them, and seems to be of that quality which is generally called *blind coal* in Britain, and of which many beds in our regular coal-measures consist, in several situations, as in the South Wales Coal-basin. The great Pennsylvanian coal-fields are situated in the valleys of the Susquehanna, Lackawanna, and the Lehigh and Schuylkill rivers, the two last being affluents of the Delaware.

The natural beauties of these valleys seem destined at no distant period to be impaired by black smoking heaps, such as those which in our own country disfigure the valleys of the Tyne and the Wear. The coal-region along the Susquehanna River is in the valley of Wyoming, and runs up into the valley of its tributary the Lackawanna. It is between sixty and seventy miles long, by about five miles broad. The beds of coal break out in the face of the precipices, in the banks and beds of the rivers, and occur in several alternations with conglomerates, sandstones, and slates. In these sandstones and slates, as well as in the coal itself, there are numerous vegetable impressions, belonging to the fern tribe and others. From the description of these by Professor Silliman, coupled with the fact that balls of clay-ironstone accompany the strata, we are led to doubt whether these strata belong, as it has been said, to an earlier geological period than the regular coal-measures in Europe.

The coal-region of the Lehigh River is chiefly wrought at a place called by an Indian name, Mauch Chunk. The coal here also forms alternating beds with sandstones and slates, and is extracted at the summit of a mountain 1500 feet above the level of the sea, in a quarry open to the day. The beds are usually from twenty to twenty-five feet thick, but in some places they swell out to fifty-four feet, and they are known to extend over many miles. These mines, together with others on the Schuylkill River, are an immense source of wealth to the state of Pennsylvania. They are now extensively wrought, and the coal is conveyed by railroads to the banks of the navigable rivers. They will have a powerful influence on the future condition of the United States, for there is enough to supply the whole country along the Atlantic shore for many ages. Deposits of the same kind of coal are wrought in Rhode Island, and in Worcester County in the state of Massachusetts. Bituminous coal, of the same sort with the regular coal-measures of Europe, is found in several places on the Atlantic Slope. About ten or twelve miles west of Richmond, in Virginia, Mr. Maclure says that there is such a deposit, from twenty to twenty-five miles long, and about ten miles wide; it is situated in an oblong basin, having a whitish freestone and slaty clay with vegetable impressions alternating with the coal. It lies upon and is surrounded by primary rocks. Bituminous coal is abundant also in Tioga County, in the state of New York. About one mile west of the summit of the Alleghany, on the road from Philadelphia to Pittsburg, the coal-measures appear, and descending into the valleys, the transition strata again emerge.

There are, in several other situations in the Appalachian system, very extensive deposits of bituminous coal; one of the most remarkable of which is in the vicinity of Pittsburg, on the Ohio, where it is associated with ironstone, as in Staffordshire, and, from very similar local advantages, a Birmingham for the United States has grown up at Pittsburg. A mountain group, called the Laurel Ridge, lies between Pittsburg and the Alleghanies, and is separated from the latter by a wide valley. Near the summit of the mountain are strata of sandstone and bituminous shale alternating with coal, which is thick enough to be worked. These coal-measures are very little lower than the summit of the Alleghanies, and as they are horizontal, they must have been raised up from the bottom of the sea in a vertical direction to this great height; a circumstance which perhaps seems to indicate rather a gradual upheaving of the Appalachian system, than a sudden and violent action. The coal-mines near Pittsburg are opened along the sides of the hills at an elevation of 520 feet above the level of the Ohio, and the strata are quite horizontal. This coal-formation is believed to be of great extent, indications of it having been observed

100 miles above Pittsburg; but it is not very probable that it is uninterruptedly continuous over so great an extent.

Natural springs, extremely rich in salt, are found all along the western slope of the Appalachian system; and from Onondago, in New York, to Louisiana, wherever the earth has been penetrated to any considerable depth, salt water has been found; in some places, where the boring was from 300 to 400 feet, the water rushed up with so much force, as to rise like a fountain several feet above the surface of the ground. Salt works are established at intervals along the whole line of country from Onondago to within a short distance of Natchitoches in Louisiana, and the quantity annually made is immense. In the valleys of the Appalachian system there is a considerable number and variety of mineral waters, which are much resorted to during the summer months by invalids from all parts of the States. Thermal springs also occur, as in the county of Bath, in Virginia, the western boundary of which county is the Alleghany range.

No portion of the earth of equal extent possesses so many natural advantages for the advancement of civilized society, as the country between the Appalachian Mountains and the Mississippi; vast stores of coal, iron, limestone, and salt; the land intersected in every direction with navigable rivers, affording the utmost facilities for the construction of canals; and a direct communication by water with the sea. It can hardly fail, in the course of a few centuries, to be covered with flourishing towns and a dense population.

The secondary formations of Europe, between the coal-measures and the chalk, seem to be of very rare occurrence all along the Atlantic slope. In New Jersey and Delaware there is a very extensive deposit of an argillaceous marl, containing, however, but a small quantity of lime, which, from the included fossils, has been considered both by American and French geologists to be an equivalent, in point of age, to the chalk of Europe. It reaches from 38° to $40^{\circ} 30'$ N. lat., having the ocean on the east, and being bounded on the west by primary strata, on the south by the tertiary deposits to be presently mentioned. It covers upwards of 4000 square miles, and is for the most part remarkably level. It is found in many places farther south, but covered by the tertiary strata.

From the foot of the most easterly range of the Appalachian Mountains a tract of low country, of variable breadth, extends to the shores of the Atlantic. By low we do not mean flat, for the surface is diversified by hills of moderate elevation, interspersed amid widely-extended plains. Mr. Maclure, and the American geologists who wrote fifteen years ago, described this as a vast tract of *alluvial* land; but more recent investigations, especially those of Dr. Morton, Professor Hitchcock, and Mr. Conrad, have shown that it is composed of a series of tertiary deposits. Three distinct formations have been made out, and have been called by Mr. Conrad the Lower, Middle, and Upper Tertiary, being distinguished from each other by including distinct species of fossil shells. The Lower contains chiefly extinct species, the Middle a mixture of extinct species with others still inhabiting the coasts of the United States; the Upper contains scarcely anything besides the remains of existing species. Following the principle of subdivision of the Tertiary deposits adopted by Mr. Lyell, the Lower formation may be Eocene, and the Middle formation may be Miocene; but the Lower may also belong to the Miocene period. The question turns upon the *relative proportions* of recent and extinct species among the fossil shells contained in the beds. There seems no doubt that the Upper formation belongs to the Newer Pliocene period. These formations collectively, according to Mr. Conrad, form the Atlantic margin of the United States, from Sandy Hook in New Jersey to the peninsula of Florida, from whence they skirt the Gulf of Mexico, to the waters of the Mississippi. The lower tertiary is met with at the western boundary of the Atlantic slope; the upper tertiary extends to the shores of the ocean. This last also occupies by far the greatest extent of surface, extending from 100 to 150 miles west from the sea. Thus we arrive at the remarkable conclusion, as has been observed by Mr. Murchison in speaking of Mr. Conrad's work on Tertiary Shells, that the vast portion of the American continent covered by the upper tertiary deposit, must have been raised from the bottom of the ocean since the time when the existing species of mollusca occupied the adjoining seas. It is stated by Mr. Conrad that on

fresh-water lacustrine formations have yet been discovered among the tertiary deposits of the United States. This is a remarkable fact; but as the space is vast and much covered by vegetation, and the careful and competent observers of geological phenomena have hitherto been few, we are perhaps hardly enabled as yet to say positively that they do not exist. These tertiary formations do not in all places occupy the surface; they are covered in many situations by great accumulations of gravel, sand, and other alluvium. In these have been found the remains of extinct quadrupeds, such as the mastodon in New Jersey and North Carolina, the megatherium in Georgia, and extinct species of the elephant in several places.

Among the unstratified rocks, granites, sienites, and serpentines occur abundantly in the Northern States, and in detached localities; but less frequently as far as the southern extremity of the mountain system.

Trap rocks of different kinds are found in many places, and sometimes in the form of columnar basalt, but there is not a trace of recent volcanic action throughout the whole of the Appalachian system.

There are both iron and lead mines, but the produce of neither has hitherto been very considerable. Gold has been found rather abundantly in the states of North Carolina and East Tennessee. The gold country of North Carolina, according to Professor Olmsted, lies on the southern side of the state, and is spread over a space of not less than a thousand square miles. The prevailing rock is a clay slate, which forms a zone more than twenty miles wide; it has interstratified beds of siliceous slate, and both are traversed by quartz veins. It is in these veins that the gold appears to exist, but almost all that is found is in the form of grains and detached lumps of various sizes in the alluvium which covers the rocks. It has been found, within these few years, in considerable quantities in the mountainous parts of the state of Georgia, not only in the alluvium, but also in veins in the rocks; usually in quartz veins, in talc slate, and mica slate, accompanied by iron pyrites. There have been found in Georgia the remains of works, which were carried on by some people before the arrival of Europeans, consisting of a shaft and excavations in a large quartz vein, with part of a furnace, and some tools.

In the natural state of the country, that is, when it was first discovered by Europeans, an almost unbroken forest spread over and around the Appalachian system of mountains, reaching to the Atlantic Ocean, Gulf of Mexico, far beyond the St. Laurence river, and westward beyond the Mississippi. The spots which have been cleared in this ocean of trees are very insignificant when compared with its vast extent, which has been estimated at 2,000,000 of square miles. The most valuable trees are several species of oak, pine, and hickory, and three or four species of maple, one of which, the sugar maple, is extremely valuable. The liriiodendron, a kind of magnolia, flourishes in such luxuriance of growth, as to be called the pride of the western forests. The great Weymouth pine is one of the most beautiful of the North American forest trees, attaining its greatest magnitude and perfection in the more northern regions. Its trunk is often of the diameter of five or six feet, rising smooth and straight from 60 to 80 feet, and terminated by a dense conical top. It forms a striking feature in the forest scenery of Vermont, New Hampshire, New York, and some parts of Canada; rising by nearly half its elevation above the summits of the other trees, and resembling, like the palms of the tropics, a forest planted upon another forest. Descending from the Alleghanies into the valley of the Ohio, we find near the summit of Laurel Ridge a change in the aspect of the forest. The deep hue of the hemlock spruce, the Weymouth pine, and other trees of the family of coniferæ, is exchanged for the livelier verdure of the broad-leaved laurel, the rhododendron, and magnolia. (Darby's *View of the United States*; various Memoirs in *Silliman's Journal of Science*; Maclure's *Geology of the United States*.)

APPALACHICO'LA, a river of the United States, which rises in the state of Georgia, and flows into the Gulf of Mexico. The Appalachicola consists of two main branches, the Chatahochee and Flint river; and the Chatahochee itself consists of two main branches, the Chestatee and Chatahochee proper. The Chestatee rises in the northern extremity of Habersham county, in the state of Georgia (33° N. lat.), and in the high table-land of the Appalachian system, at an elevation of about 2600 feet. Its sources are near

those of the Savannah, which flows into the Atlantic, the Coosa, which is an affluent of the Alabama river (see ALABAMA), and the Tennessee, one of the great affluents of the Mississippi. The Chestatee, after a course of 100 miles, for the most part S.S.W., receives, near the parallel of 34° and from the N.E., the Upper Chatahooche, whose course to the point of junction is shorter than that of the Chestatee.

At their junction, the river takes the name of Chatahooche, and pursues a general southern course for 250 miles to about 30° 40' N. lat., where it is joined on the east by the Flint River. This river system presents several peculiarities. The general course of the Chatahooche proper, and that of the united streams for a short distance below the point of junction, is about S.W. Following the course of the Chatahooche proper downwards, at a short distance from its channel and to the east we find some of the higher affluents of the Savannah and all the head waters of the Alatomaha: these two rivers flow into the Atlantic. Thus it appears that a very narrow belt of high land divides the channel of the Chatahooche proper from the sources of the Atlantic streams just mentioned. From the junction of the Chestatee and Chatahooche to the junction of the Flint River, no stream larger than an inconsiderable creek joins the Chatahooche, which has a long and very narrow basin, estimated at about 320 miles in length, with a mean breadth of 35 miles, and an area of 11,200 square miles.

The Flint River rises in Georgia (33° 30' N. lat.), and as its upper waters have a direction exactly similar to those of the upper waters of the Alatomaha, it appears, for about a third part of its course, doubtful whether its waters will enter the Gulf of Florida or the Atlantic. Its general direction is S., and then S.W. to its junction with the Chatahooche; its course is estimated at about 210 miles, and its basin is narrow, not exceeding 40 miles of average breadth.

The united streams of the Chatahooche and Flint take the name of Apalachicola, and run S. 70 miles, dividing into several channels and forming a delta. The outlets of this stream are in St. George's Sound, in the Gulf of Mexico, in 29° 46' N. lat. The direction of this river is singularly straight, having a general southern course of above 400 miles; it runs through more than five and a half degrees of latitude; and as the elevation of the highest parts of the river is 2000 feet, we have, as we advance from the mouth to the source, all the variations of temperature that can arise from the combined effect of variation of latitude and elevation of surface.

The Apalachicola is navigable for vessels up to the junction of the two great branches, and the Chatahooche is navigable for boats almost to its source. The bed of the river is said to be deep and capacious: the tides ascend about two-thirds of the distance between the sea and the junction of the Flint and Chatahooche. (Darby's *Geographical View of the United States*.)

APPARATUS SCULPTORIS, or the Sculptor's Workshop, a constellation formed by LACAILLE. It is situated in that region of the heavens immediately to the eastward of the large star Fomalhaut or a Piscis Australis, and hardly rises above the horizon in our hemisphere. It is bounded by Cetus and Aquarius on the north, Fornax Chemica on the east, Piscis Australis on the west, and Phoenix on the south. Its principal stars are designated as follows:

Character.	No. in Catalogue of		Magnitude.
	Piazzi.	Astron. Society.	
κ^2	6	12	5.6
γ	36	2779	5
ϵ	50	24	6
δ	99	165	6
ϵ	168	191	5
δ	192	2344	5
α	250	100	5
κ^1	285	4	6

APPARENT (in astronomy). When it is necessary or convenient to reduce an observed phenomenon, either by clearing it of the effects of any optical delusion, or substituting for it the phenomenon which would have been observed at some more commodious station, that which is actually observed is called the *apparent* phenomenon, in opposition to that which results from correction or reduction, which is

called the *real* or *true* phenomenon. Without discussing the propriety of these names, we shall give a few instances of their use. The apparent altitude of a star requires a correction for **REFRACTION**, an optical delusion which makes the star appear a little higher than it would do if there were no atmosphere. The observed (*apparent*) place of a planet is always reduced to that in which it would be seen from the *centre* of the earth, which is called its true place [see **PARALLAX**]. The same correction is required to reduce the *apparent* phenomena of an eclipse to the *true*. The *apparent* or *sensible* horizon is the plane in which lies the circle actually bounding the view; the *real* or *rational* horizon is a plane parallel to the preceding, drawn through the centre of the earth. These will be sufficient exemplifications of the use of the word; which, it must be observed, is arbitrary, and, in some cases, inconsistent. For example, the *apparent* diameter of a planet is the *angle* made by two lines drawn to the eye from opposite points of its disk; while the *true* diameter is a magnitude of a different kind, namely, the *line* which joins the points of the disk aforesaid. Nevertheless, the preceding *apparent* diameter of the moon, reduced to the centre of the earth, would be called the true diameter by astronomers, from which some confusion might arise, were it not that the linear diameter very seldom enters into the computation.

APPARENT MAGNITUDE. The angle under which any line appears at the eye, that is, the angle made by lines drawn from its extremities to the eye. [See **MAGNITUDE**.]

APPARENT MOTION. The velocity and direction in which a body appears to move, when the spectator himself is in motion, without being conscious of it. For further detail see **MOTION**.

APPARITION. The mind affects the body; the body affects the mind, and some insight may be obtained into the disordered states of the mind, by considering the physical conditions which are necessary to sound thought.

It is not true, as is commonly supposed, that we see with the eye, and hear with the ear, and taste with the tongue. The true seat of these sensations is the brain, and the eye, the ear, the tongue, are organs adapted to receive impressions from external objects, which impressions are transmitted from the organs by an appropriate apparatus to the brain; where they become sensations. When an object is presented to an organ of sense, it produces a change in the nerves of that organ. This change is conveyed by the nerves to the brain; a corresponding change is occasioned in the brain, and through the brain in the mind; and it is this change in the mind which is expressed by the term sensation. Ideas on the contrary are copies of sensations, renovations of prior feelings, in general differing from sensations in being less intense.

The functions of the brain, then, are sensation, and, if the analogous term be allowed, ideation, together with the action and re-action of these two states on each other, known under the name of intellectual operation. The main instrument by which intellectual operation is carried on is what is termed association. It is a property of the mind to combine and unite the sensations and ideas it receives in such a manner, that, after this combination or union has been once formed, if any one of these sensations and ideas be revived, the single sensation or idea so revived will immediately call up to view all the sensations and ideas that had previously been connected with it; and this power of association, as long as its action is sound, is observed to operate in a uniform and determinate manner. For example, when sound, association excites ideas in a certain order, generally in the order of sensation. Thus, if the sensations A B C were impressed upon the mind in the order of these letters, B will re-excite not A, but C. Association, when sound, operates by exciting ideas with a certain degree of velocity. If the rapidity of the succession of the trains of ideas pass beyond a certain point, instead of distinct, there is confused thought. Association, when sound, operates by exciting ideas with a certain degree of vivacity. Sensation is not produced, unless the external object be applied to the organ of sense with a certain degree of force; while, if propelled against it with too great an impetus, instead of specific sensation, it excites only pain. In like manner, unless the trains of ideas recalled by association possess a certain degree of vivacity, they present to the mind an indistinct assemblage of images; if, on the other hand, they are too vivid, they are equally incapable of forming the elements of sound thought.

In order that the brain may carry on these operations, that is, in order that it may receive the impressions conveyed to it by the nerves from the organs of sense, in order that it may convert these impressions into sensations, and in order that it may duly combine and revive them, it must be in a sound state. The chief agents which maintain the brain in a sound state are its organic nerves, and its circulating vessels. Like every other organ, the brain is maintained in a healthy condition by the organic process of nutrition, over which the system of nerves termed organic [see NERVE] preside. If these organic nerves become disordered disease may take place in the substance of the brain, and this disease may assume a variety of forms far too great to be enumerated here, the slightest of which may be incompatible with the production of sound thought. If, on the other hand, the flow of blood through its circulating vessels be deranged, the process of thought may be equally disordered. Stop the flow of blood to the brain altogether, insensibility will follow instantly; fainting will supervene, and this state will be quickly succeeded by death, unless the vital current be re-admitted. Quickened the circulation beyond a certain point, insensibility equally follows; and, though the preternatural velocity of the circulation should stop short of inducing insensibility, it may yet disturb the ordinary process of thought in an infinite variety of modes.

Now there is scarcely a single disease which is not capable of disturbing, in a greater or less degree, the action of the organic nerves of the brain; but the maladies which most commonly and remarkably disturb the functions of these nerves are certain diseases of the abdominal viscera, particularly of the alimentary canal, and more especially of that portion of it which forms the stomach; certain diseases of the liver, and of the mesenteric glands, and of the urinary and reproductive organs. In like manner excitation or depression of the action of the blood-vessels of the brain, beyond a certain point, uniformly disorders sensation and all the mental operations. Striking illustrations of both are afforded by the effect of many physical agents, as well as of natural diseases. Of the first, the effects of the inhalation of nitrous oxide affords an example. When nitrous oxide is received into the lungs, the pulse is increased in strength, fulness, and velocity. A corresponding change takes place in the mental impressions. Sensation becomes more vivid; the sensibility to touch increases; luminous points dazzle the eye; the hearing is more acute; recollections, generally of a pleasing nature, and of uncommon intensity, pass rapidly through the mind. One individual compares his feelings, under the influence of this gas, to those which he experiences when witnessing an heroic scene upon the stage; another likens them to the emotions he felt when, on the occasion of the commemoration held at Westminster Abbey in honour of Handel, he heard seven hundred instruments playing at one time.

'After my return from a long journey,' says Sir Humphry Davy, 'being fatigued, I respired nine quarts of nitrous oxide, having been thirty-three days without breathing any. After the first six or seven respirations I gradually began to lose the perception of external things, and a vivid and intense recollection of some former experiments passed through my mind, so that I called out "What an amazing concatenation of ideas!"' On another occasion, after having been enclosed in an air-tight breathing box, of the capacity of nine cubic feet and a half, in which he became habituated to the excitement of the gas, which was there carried on gradually, and after having been in this place of confinement an hour and a quarter, during which time no less a quantity than eighty quarts were thrown in, this experimentalist says, 'The moment after I came out of the box I began to respire twenty quarts of unmingled nitrous oxide. A thrilling, extending from the chest to the extremities, was almost immediately produced. I felt a sense of tangible extension, highly pleasurable, in every limb; my visible impressions were dazzling, and apparently magnified. I heard distinctly every sound in the room, and was perfectly aware of my situation. By degrees, as the pleasurable sensation increased, I lost all connexion with external things; trains of vivid, visible images rapidly passed through my mind, and were connected with words in such a manner as to produce sensations perfectly novel. I existed in a world of newly-connected and newly-modified ideas. When I was awakened from this semi-delirious trance by Dr. Kinglake, who took the bag from my mouth, indignation and pride were the first feelings produced by the sight of the persons

about me. My emotions were enthusiastic and sublime; and for a moment I walked round the room perfectly regardless of what was said to me. As I recovered my former state of mind, I felt an inclination to communicate the discoveries I had made during the experiment. I endeavoured to recall the ideas—they were feeble and indistinct. One recollection of terrors, however, presented itself, and with the most intense belief and prophetic manner, I exclaimed to Dr. Kinglake, "Nothing exists but thoughts; the universe is composed of impressions, ideas, pleasures, and pains!"'

From this interesting experiment, it appears that in consequence of an extraordinary impression upon the brain, through the medium of the nerves and the circulating vessels, 1. sensations were increased in intensity; 2. ideas were increased in vividness; 3. in consequence of this change in the ordinary state of sensation and ideation, all connexion with external things was lost—a world of newly-connected and newly-modified ideas arose; 4. emotions were produced corresponding in intensity to the acuteness of sensation and the vividness of ideas. 'My emotions were enthusiastic and sublime. I exclaimed, "Nothing exists but thoughts; the universe is composed of impressions, ideas, pleasures, and pains!"'

The inhalation of malaria, the poison which produces fever, affords an equally striking illustration of the modification of sensation, and of all the subsequent operations of the mind, by a cause affecting the nerves and blood-vessels of the brain. Febrile miasma is a depressing, nitrous oxide a stimulating, agent; the effect of the former on the brain ought therefore to be the reverse of the latter, and, accordingly, on receiving into the lungs the febrile miasma, the pulse becomes oppressed and weak; languor and lassitude pervade the limbs; the countenance becomes pale, the surface cold; headache, giddiness, and sometimes vomiting supervene, while the mind is feeble, dull, dejected, incapable of the effort of attention, and utterly unable to control or even to connect the trains of gloomy and distressing images which terrify the imagination. 'Some circumstances had occurred,' says a physician who carefully observed the phenomena which attended the progressive derangement of his own mind under the influence of fever, 'to render me anxious and dispirited; of these I took an exaggerated and gloomy view. I had been studying during several months with unusual severity. One day in the cold weather of January, after having been occupied many hours in the practical duties of my profession, I returned home fatigued. Great as was my bodily exhaustion, the depression of my mind was still more remarkable. My head ached, and unable to study or to attend to any professional engagement, I lay on the sofa and attempted to read, chance having thrown in my way the American novel called the *Water Witch*. I became interested in the story, but the pain and confusion of my head increasing, I requested a friend to read to me, my own eye continually wandering from the page. The progress of the fever was rapid; its chief force fell upon the organ that had been recently over-exerted, the brain; and delirium came on early, and somewhat suddenly. Immediately before I became decidedly delirious, I received an invitation to the soirées given by the Duke of Sussex to the members of the Royal Society. The friend I asked to return an answer expressive of my regret that I should be unable to attend on account of illness, used, as I conceived, an expression not strictly correct: this verbal inaccuracy, I thought, was construed into wilful falsehood; the matter was brought before this assemblage of learned men, who unanimously declared that it ought to exclude me from the society of honourable men, and that I should no more be admitted amongst them. This announcement was brought me from the palace, accompanied with martial music, but of a more solemn and impressive kind than I had ever heard before, in which was predominant the sound of bells, soft and as if of silver tone. Remonstrance was vain: the decision, of which I succeeded in obtaining a reconsideration, was confirmed; this confirmation was brought me in the same manner as the first announcement, accompanied with the same kind of music, only still more solemn and impressive. I saw no person forming the band of musicians, but occasionally I heard very distinctly their measured steps. I now thought myself an abandoned and lost being; and the apprehension that every one about me hated and sought occasion to destroy me, took possession of my mind. My physicians, my nurses, my dearest friends, were in league

with a malignant spirit, which assumed the shape of the demon of the *Water Witch*. By an object of my tender affection, who was anxiously watching over me, but in whom I now saw only the willing agent of the demon, I was betrayed, and through this treachery the malignant spirit obtained entire possession of me. No sooner was I in the power of the demon than she began to suggest to me the commission of crimes abhorrent to my nature, and at last there fixed upon my mind the impression that I had really been guilty of the crimes, by the vivid picture of which my imagination had been disturbed. I pass over the hurricanes and storms I encountered, evidently suggested by the descriptions in the novel I had just been reading; on the sudden subsidence of these I thought I stood before an invisible tribunal. I felt a solemn consciousness that an all-seeing eye was on me; while there was visible to me only a portion of the deck of the *Water Witch*, and very obscurely the shadow of my malignant accuser. Not the crimes falsely laid to my charge, but the actual events of my life, even the events of childhood and youth, long forgotten, were now called up before me with extraordinary vividness; all the circumstances of place, person, dress, language, and attitude, such as had actually accompanied them, being revived. Of each of these events I was compelled to give a true account, an invisible hand recording every syllable that fell from my lips, and a secret power obliging me to utter the words which expressed the exact truth. During this ordeal I saw the countenances of dear friends, and of secret and open enemies, those that had long been dead, as well as those that were still living; the former cheering me by their attitudes and words, the latter scowling upon me and assuming menacing postures, but uttering no sound. And now again I felt myself under the power of the demon, by whose uncontrollable agency I was compelled to accuse myself of the crimes of her own suggesting; and while suffering the bitter anguish of self-reproach, and expecting some fearful punishment, I again saw my dearest friends, with their innocent and happy countenances, engaged in occupations with which associations of a highly pleasurable nature had been formed in my mind, but whom I could not make sensible of my presence, and with whom I was doomed to hold affectionate intercourse no more. After this I have no remembrance of anything that passed, until conscious of the return of some obscure and vague recollections. I had the impression that some calamity had befallen me; but I felt as if a soft and refreshing breeze were blowing gently upon me; and soon I found myself in a vast ocean, in a beautifully-constructed vessel, with a fresh and invigorating breeze, sailing rapidly along a coast presenting the most magnificent and lovely scenery; and at length the vessel entered gallantly a port unknown to me, but the strand was crowded with human beings with happy faces, and still happier voices. I had returned from a long voyage, but I could not make out where I had been. I felt hungry and fatigued; and now, for the first time, I recognized the individuals of my family, after having been violently delirious upwards of a fortnight, during the last three days of which time I lay in a state of total insensibility, my physicians and friends expecting every moment to be the last.

Whoever will consider carefully the mental phenomena produced by the different and opposite conditions of the brain in these two instructive cases, the one produced by the operation of a physical agent, the other arising under the influence of disease, will have no difficulty in conceiving the origin of spectral illusions, either with the consciousness that they are illusions, or with a temporary or permanent persuasion that they are real existences, and whether arising from external or internal causes, or from both combined.

The case of Nicolai, the celebrated bookseller of Berlin, affords a curious illustration of the long continuance of vivid spectral illusions, without the slightest belief of the real existence of the apparitions. 'In a state of mind completely sound, and after the first terror was over, with perfect calmness,' says this remarkable man, 'I saw, for nearly two months, almost constantly and involuntarily, a vast number of human and other forms, and even heard their voices.'

'My wife and another person came into my apartment in the morning, in order to console me, but I was too much agitated by a series of incidents, which had most powerfully affected my moral feeling, to be capable of attending to them. On a sudden, I perceived, at about the distance of ten steps, a form like that of a deceased person.

I pointed at it, asking my wife if she did not see it? It was but natural that she should not see anything: my question therefore, alarmed her very much, and she immediately sent for a physician. The phantom continued about eight minutes. I grew at length more calm, and being extremely exhausted, fell into a restless sleep, which lasted about half an hour. The physician ascribed the apparition to a violent mental emotion, and hoped there would be no return; but the violent agitation of my mind had in some way disordered my nerves, and produced further consequences which deserve a minute description.

'At four in the afternoon, the form which I had seen in the morning, re-appeared. I was by myself when this happened, and being rather uneasy at the incident, went to my wife's apartment, but there likewise I was persecuted by the apparition, which, however, at intervals disappeared, and always presented itself in a standing posture. About six o'clock there appeared also several walking figures, which had no connexion with the first. After the first day, the form of the deceased person no more appeared, but its place was supplied with many other phantasms, sometimes representing acquaintances, but mostly strangers: those whom I knew were composed of living and deceased persons, but the number of the latter was comparatively small. I observed the persons with whom I daily conversed did not appear as phantasms, these representing chiefly persons who lived at some distance from me.

'These phantasms seemed equally clear and distinct at all times, and under all circumstances, both when I was by myself, and when I was in company, and as well in the day as at night, and in my own house as well as abroad: they were, however, less frequent when I was in the house of a friend, and rarely appeared to me in the street. When I shut my eyes, these phantasms would sometimes vanish entirely, though there were instances when I beheld them with my eyes closed; yet, when they disappeared on such occasions, they generally returned when I opened my eyes. I conversed sometimes with my physician and my wife of the phantasms which at the moment surrounded me: they appeared more frequently walking than at rest, nor were they constantly present. They frequently did not come for some time, but always re-appeared for a longer or a shorter period, either singly or in company; the latter, however, being most frequently the case. I generally saw human forms of both sexes, but they usually seemed not to take the smallest notice of each other, moving as in a market-place, where all are eager to press through the crowd; at times, however, they seemed to be transacting business with each other. I also several times saw people on horseback, dogs, and birds. All these phantasms appeared to me in their natural size, and as distinct as if alive, exhibiting different shades of carnation in the uncovered parts, as well as different colours and fashions in their dresses, though the colours seemed somewhat paler than in real nature. None of the figures appeared particularly terrible, comical, or disgusting, most of them being of an indifferent shape, and some presenting a pleasing aspect.

'The longer these phantasms continued to visit me, the more frequently did they return; while at the same time they increased in number about four weeks after they had first appeared. I also began to hear them talk; these phantasms sometimes conversed among themselves, but more frequently addressed their discourse to me; their speeches were commonly short, and never of an unpleasant turn. At different times there appeared to me both dear and sensible friends of both sexes, whose addresses tended to appease my grief, which had not yet wholly subsided; their consolatory speeches were in general addressed to me when I was alone. Sometimes, however, I was accosted by these consoling friends while I was engaged in company, and not unfrequently while real persons were speaking to me.'

Of the natural constitution of his mind, Nicolai states, 'My imagination possesses in general a great facility in picturing. I have, for example, sketched in my mind a number of plans for novels and plays, though I have committed very few of them to paper, because I was less solicitous to execute than to invent. I have generally arranged these outlines when in a cheerful state of mind I have taken a solitary walk, or when travelling I have sat in my carriage, and could only find employment in myself and my imagination. Constantly, and even now, do the different persons whom I imagine in the foundation of such a plot present themselves to me in the most lively and distinct man-

ner, their figure, their features, their manner, their dress, and their complexion, are all visible to my fancy. As long as I meditate on a fixed plan, and afterwards carry it into effect, even when I am interrupted and when I must begin it again at different times, all the acting persons *continue present in the very same form* in which my imagination at first produced them. I find myself frequently in a state between sleeping and waking, in which a number of pictures of every description, often of the strangest forms, show themselves, change, and vanish. In the year 1778, I was afflicted with a bilious fever, which at times, though seldom, became so high as to produce delirium. Every day, towards evening, the fever came on, and if I happened to shut my eyes at that time, I could perceive that the cold fit of the fever was beginning, even before the sensation of cold was observable. This I knew by the distinct appearance of coloured pictures, of less than half their natural size, which looked as in frames! They were a set of landscapes, composed of trees, rocks, and other objects. If I kept my eyes shut, every minute some alteration took place in the representation. Some figures vanished and others appeared. But if I opened my eyes, all was gone; if I shut them again, I had a different landscape. In the cold fit of the fever, I sometimes opened and shut my eyes every second, for the purpose of observation, and every time a different picture appeared, replete with various objects, which had not the least resemblance to those that appeared before. These pictures presented themselves without interruption as long as the cold fit of the fever lasted. They became fainter as soon as I began to grow warm; and when I was perfectly so, all were gone. When the cold fit of the fever was entirely past, no more pictures appeared; but if on the next day I could again see pictures when my eyes were shut, it was a certain sign that the cold fit was coming on.

This is a remarkable instance of spectral illusion manifestly arising from a physical cause, in a person of a philosophical turn of mind, able to refer the illusions to their real source, and therefore to maintain his consciousness of their true nature. It was otherwise with John Beaumont, the author of a Treatise on Spirits and Apparitions, who was a man of hypochondriacal disposition, and who, while labouring under this bodily disease, saw hundreds of imaginary men and women about him, and in whose real existence he came to be a firm believer. Among the spirits that visited him, there were two who became his constant attendants, and who called each other by their names: several spirits would often call at his chamber, and ask whether such spirits lived there, calling them by their names, and they would answer, they did. One spirit, which came for several nights together, and rung a little bell in his ear, told him that his name was Ariel. The two spirits that constantly attended him were ladies of a brown complexion, about three feet in stature; they had both black loose net-work gowns, tied with a black sash about the middle; and within the net-work appeared a gown of a golden colour, with somewhat of a light striking through it. 'These women told me they would kill me if I told any person in the house of their being there, which put me in some consternation, and I made a servant sit up with me four nights in my chamber, before a fire, it being in the Christmas holidays; telling no person of their being there. One of these spirits, in woman's dress, lay down upon the bed by me every night; and told me, if I slept, the spirits would kill me, which kept me waking for three nights. In the mean time, a near relation of mine went (though unknown to me) to a physician, of my acquaintance, desiring him to prescribe me somewhat for sleeping, which he did, and a sleeping potion was brought me, but I set it by, being very desirous and inclined to sleep without it. The fourth night, I could hardly forbear sleeping, but the spirit, lying on the bed by me, told me again, I should be killed if I slept; whereupon I rose, and sat by the fire-side, and in a while returned to my bed; and so I did a third time, but was still threatened as before; whereupon, I grew impatient, and asked the spirits, what they would have?—told them I had done the part of a Christian, in humbling myself to God, and feared them not; and rose from my bed, took a cane, and knocked at the ceiling of my chamber; a near relation of mine, lying then over me, who presently rose and came down to me, about two o'clock in the morning; to whom I said, you have seen me disturbed these four days past, and that I have not slept—the occasion of it was, that five spirits, which are now in the room with me, have threatened to kill me if I told any person of

their being here, or if I slept; but I am not able to forbear sleeping longer, and acquaint you with it, and now stand in defiance of them: and thus I exerted myself about them; and, notwithstanding their continued threats, I slept very well the next night, and continued so to do, though they continued with me above three months, day and night.'

We have seen that some minds have a strong natural tendency to form vivid pictorial images of every thing that interests them; in others, there is a like tendency to the intense renovation of past impressions. 'I remember,' says Dr. Ferriar, 'that, about the age of fourteen, if ever I had been viewing any interesting object in the course of the day, such as a romantic ruin, a fine seat, or a review of a body of troops, as soon as evening came on, if I had occasion to go into a dark room, the whole scene was brought before my eyes with a brilliancy equal to what it had possessed in daylight, and remained visible for several minutes. I have no doubt that dismal and frightful images have been often presented to the mind in the same manner after scenes of domestic affliction or public horror.' Certain states of the body, and certain affections of the mind, powerfully predispose to the intense renovation of past impressions, however those impressions have been induced, and whatever their nature, the immediate exciting cause of the renovation being often some external object acting upon the senses or upon the imagination under circumstances favourable to the illusion. A large class of spectral illusions are referable to this head, of which the following may be taken as an example. A gentleman was benighted, while travelling alone in a remote part of the highlands of Scotland, and was compelled to ask shelter for the evening at a small lonely hut. When he was to be conducted to his bed-room, the landlady observed, with mysterious reluctance, that he would find the window very insecure. On examination, part of the wall appeared to have been broken down to enlarge the opening. After some inquiry, he was told that a pedlar, who had lodged in the room a short time before, had committed suicide, and was found hanging behind the door in the morning. According to the superstition of the country, it was deemed improper to remove the body through the door of the house; and to convey it through the window was impossible, without removing part of the wall. Some hints were dropped that the room had been subsequently haunted by the poor man's spirit. My friend laid his arms, properly prepared against intrusion of any kind, by the bed-side and retired to rest, not without some degree of apprehension. He was visited in a dream by a frightful apparition, and, awaking in agony, found himself sitting up in bed, with a pistol grasped in his right hand. On casting a fearful glance round the room, he discovered by the moonlight a corpse dressed in a shroud, reared erect against the wall close by the window. With much difficulty he summoned up resolution to approach the dismal object, the features of which, and the minutest parts of its funeral apparel, he perceived distinctly. He passed one hand over it, felt nothing, and staggered back to bed. After a long interval, and much reasoning with himself, he renewed his investigation, and at length discovered that the object of his terror was produced by the moonbeams, forming a long, bright image, through the broken window, on which his fancy, impressed by his dream, had pictured, with mischievous accuracy, the lineaments of a body prepared for interment. Powerful associations of terror, in this instance, had excited the recollected images with uncommon force and effect.

The peculiarity of constitution expressed by the term predisposition, whether corporeal or mental, is not only deeply implicated in the production of a general tendency to the formation of these phantoms, but it often determines even the specific character which each assumes. Since the predisposition varies in each individual, the same morbid cause may conjure up images the most diversified. The inhalation of nitrous oxide commonly excites vivid images of a pleasing nature, accompanied with grateful sensations; but in some cases it presents to the imagination frightful pictures, and produces on the system painful effects; and for the same reason, the morbid cause, whatever it be, which gives rise to spectral illusions, may in one excite soothing and delightful visions, and in another hideous and appalling spectres. The daughter of Sir Charles Lee 'saw, about two of the clock in the morning, the apparition of a little woman between her curtain and her pillow, who told her she was her (deceased) mother; that she was happy, and by twelve of the clock that day she should be with her.

Whereupon she knocked up her maid, called for her clothes, and when she was dressed she went into her closet, and came not out again till nine, and then brought with her a letter, sealed, to her father; brought it to her aunt, the Lady Everard, told her what had happened, and desired that as soon as she was dead it might be sent to him. She desired that the chaplain might be called to read prayers; and when prayers were ended, she took her guitar and psalm-book, and sat down upon a chair without arms, and played and sang so melodiously and admirably, that her music-master, who was then there, admired at it. And near the stroke of twelve, she rose and sat herself down in a great chair with arms, and fetching a strong breathing or two, immediately expired.' In this case, a spectral illusion occurring in a tender and susceptible frame, produced such a powerful impression upon the imagination, as absolutely to destroy life. The contrast to this is the case of the sturdy assessor to the Westminster Assembly, who received a visit from the arch-fiend himself, and whom he treated with a cool contempt, which must have astonished his Satanic majesty. 'The devil, in a light night, stood by his bedside. The assessor looked awhile, whether he would say or do anything; and then said, "If thou hast nothing to do, I have;" and so turned himself to sleep.'

There are many cases on record which directly prove that there is often the closest possible connexion between the very shape which these phantasms assume and the images which have previously occupied the mind. A writer in the fifteenth volume of Nicholson's Philosophical Journal, who was haunted with the apparition of frightful spectres, and who was at length struck with some connexion between these images and his previous thoughts, states, that he tried the experiment, whether, by fixing his meditation upon other objects, he could not make these assume the place of the phantasms which persecuted him; that with this view, while the faces were flashing before him, he reflected upon landscapes and scenes of architectural grandeur; that accordingly, after a considerable interval of time, a rural scene of hills, valleys, and fields appeared before him, which was succeeded by another and another, in ceaseless succession; that the manner and times of their respective appearance, duration, and vanishing, did not sensibly differ from those of the faces; that the scenes were calm and still, without any strong lights or glare; that, after a time, these figures changed entirely, and consisted of books, parchments, or papers, containing printed matter. The writer adds, 'I was now so well aware of the connexion of thought with these appearances, that, by fixing my mind on the consideration of manuscript instead of printed type, the papers appeared, after a time, only with manuscript writing, and afterwards, by the same process, instead of being erect, they were all inverted or appeared upside down. The intelligent and philosophical Nicolai saw nothing but men and women, in their natural form and aspect, horses, dogs, and birds: the illusions of superstitious minds consist of angels or devils, which assume all sorts of fantastic shapes. Remigius, who was a commissioner for the trial of witches in Lorrain, and who boasts that, in the course of fifteen years, he had condemned nine hundred criminals to the stake, paid particular attention to the form, features, and dress of demons; yet his statements clearly show that they did not vary from the gross sculptures and paintings of the middle ages, and that recollected images only were present to the persons labouring under the delusions for which they suffered death. They are said to be black faced, with sunk but fiery eyes; their mouths wide, and smelling of sulphur; their hands hairy, with claws; their feet horny and cloven.

A devil would appear like an angel, seated in a fiery chariot; or riding on an infernal dragon, and carrying in his right hand a viper; or assuming a lion's head, a goose's feet, and a horse's tail; or putting on a raven's head, and mounted on a strong wolf; with innumerable other fantastic shapes of a similar description. These mysterious and frightful images were not only made familiar to the imaginations of the people, but even to their very senses. They could go neither into their dwellings nor their temples without seeing them; they were sculptured on the walls of the church, they were carved on the wainscots of the domestic hall, and the air and the earth were peopled with them; there was not a hill nor a valley, not a wood nor a grove, not a fountain nor a stream, in which they were not seen and heard, and communed with. No place was void,' says Burton, 'but all full of spirits, devils, or other inhabit-

ants; not so much as a hair breadth was empty in heaven, earth, or water above or under the earth.' 'Our mothers' maids,' observes Reginald Scot, 'have so terrified us with an ugly devil, having horns on his head, fier in his mouth, and a tail in his breach, eies like a bacon, fangs like a dog, claws like a beare, a skin like a niger, and a voice roaring like a lion, that we start and are afraid when we hear any one cry *baugh!*'

What wonder that these hideous phantoms should make an indelible impression on weak and ignorant minds, and exert an influence even over strong and cultivated understandings, which their better reason could not at all times resist! What wonder when, from corporeal disease, sensations and ideas were rendered preternaturally intense, or the vivacity of ideas was so increased as to overpower actual impressions, that these spectres should be seen in solitude, and heard in the storm; should dance before the eye, and whisper in the ear; should assume a menacing aspect in the dreams of the guilty, and come with the cherub's smile in the visions of the innocent; should be to the maniac all that existed, and to the feverish and dying what most they hoped or feared!

In regard to ghosts, it is observable that they were remarkably abundant in this country during the interregnum after the civil war in 1649. 'The melancholic tendency of the rigid puritans of that period; their occupancy of old family seats, formerly the residence of hospitality and good cheer, which in their hands became desolate and gloomy; and the dismal stories propagated by the discarded retainers to the antient establishments, ecclesiastical and civil, contributed altogether to produce a national horror unknown in other periods of our history.' It is well known that ghosts commonly appear in the same dress they wore when living; sometimes, indeed, they are clothed all in white, but these are chiefly the 'churchyard ghosts, who have no particular business, but seem to appear *pro bono publico*, or to scare drunken rustics from tumbling over their graves. Dragging chains is not the fashion of English ghosts, chains and black vestments being chiefly the accoutrements of foreign spectres, seen in arbitrary governments,—dead or alive English spirits are free.' Ghosts are commonly pale, and often assume a misty or cloudy appearance, the spectral idea of colour not quite equalling in intensity the vividness of an immediate sensation. The phantoms seen by Nicolai were always of a paler colour than real beings; and when they began to diminish and disappear, their colour became fainter and fainter, until at last they appeared entirely white.

We cannot dismiss the subject of apparitions without observing, that the manner in which these phantoms have vanished before the light of knowledge affords a striking illustration of the blessings which descend even to the lowest of the people from the diffusion of the sound principles of philosophy. The powerful and capricious spirits which filled 'the heavens, the earth, and the waters above and under the earth,' added, in no inconsiderable measure, to the sum of human suffering. They were, in general, hideous in form, and malignant in intention; the number of the good small, that of the evil countless; and though of 'soft and uncompounded essence,' they might have come in what shape they chose, 'dilated or condensed, bright or obscure,' yet they did assume 'forms forbidden,' such as 'retire to chaos, and with night commix;' and their visitations were much more often accompanied with 'blasts from hell' than 'airs from heaven.' They produced powerful emotion, for the most part painful and of pernicious tendency. They afforded materials for the fiction of the poet, and the pencil of the painter; but the imagery of the one, and the figures of the other, were distinguished for incongruity and deformity, not for beauty and grace. Haunting the couch of sickness, in minds debilitated by disease, they often chased reason from its throne, and sometimes deprived the sufferer of life. The ignorant they terrified with false fears, and they afforded no compensation in the uniformity and efficacy with which they visited the guilty with remorse. As agents in the administration of reward and punishment they were most unjust. If they brought down vengeance on the criminal, it was not for the commission of crime, but the neglect of punctilios; and if, as guardian angels, they hovered about the pillow of the dying, they were not messengers of evil to the wicked, and ministers of grace to the good; but this 'blessed troop, with faces bright like the sun, bearing garlands, and promising eternal happiness,' was as disposed to waft to heaven the soul of the sinner as of the saint. By

preoccupying the mind, they took off the attention from the observation of nature, and deprived it both of the power and of the disposition to discover the true solution of those physical, mental, and moral phenomena which could not wholly escape notice, and in this lies the real malignity of their influence. They incapacitated the mind for the perception of truth, disposed it for the reception of the grossest delusions of credulity, and prepared it for the admission of the most fallacious account of the sources of calamity and suffering. In the hands of the priest and the tyrant, they were potent to delude and enslave; and they did their work faithfully. The human mind will anticipate the future, and must reflect upon the past. In the former, there will always be sufficient to fear, and in the latter, enough to regret, without the stimulus of fictitious terror, or the imputation of imaginary guilt. As long as the human frame can suffer, and is subject to death, the mind will require whatever light philosophy can pour upon it, to preserve it from error, and whatever consolation religion can afford, to save it, at least, from misery, if not from despair. In philosophy, there is light, and in religion, consolation; and he is a friend to man who labours to secure to him these inestimable blessings, free from the admixture of ignorance and the alloy of superstition. See article Apparitions, *Westminster Review*, No. II., of which large use has here been made by the author of that article with the permission of the proprietors. See also *An Essay towards a Theory of Apparitions*, by John Ferriar, M.D., 1813; and *Sketches of the Philosophy of Apparitions, or an Attempt to trace such Illusions to their Physical Causes*, by Samuel Hibbert, M.D., 1824.

APPEAL. The removal of a cause from an inferior court or judge to a superior one, for the purpose of examining the validity of the judgment given by such inferior court or judge, is called an appeal.

An appeal from the decision of a court of common law is usually prosecuted by suing out a *writ of error*, by means of which the judgment of the court below undergoes discussion, and is either affirmed or reversed in the court of error. The proceedings in such cases will be found under the title **ERROR**.

The term *appeal*, used in the above sense, is by the law of England applied in strictness chiefly to certain proceedings in Parliament, in the Privy Council, in the Courts of Equity, in the Admiralty and Ecclesiastical courts, and in the Court of Quarter Sessions.

Thus, an appeal lies to the House of Lords from the decree of the Court of Chancery in this country, and in Ireland; from the Equity side of the Court of Exchequer; and from the decision of the supreme courts in Scotland.

An appeal lies to the king in council from the decrees and decisions of the colonial courts, and indeed from all judicatures within the dominions of the crown, except Great Britain and Ireland.

To the same jurisdiction are referred (in the last resort) all ecclesiastical and admiralty causes, and all matters of lunacy and idiocy.

A decision of the Master of the Rolls or the Vice-Chancellor may be revised by the Lord Chancellor upon a proceeding in the nature of an appeal.

An appeal lies directly from the Vice-Admiralty courts of the colonies, and from other inferior admiralty courts, as well as from the High Court of Admiralty, to the king in council. This latter appellate jurisdiction has been recently regulated by statutes 2 and 3 Will. IV. c. 92, and 3 and 4 Will. IV. c. 41, by which the Court of Delegates, Commission of Review, and Commission of Appeal in Prize Causes, have been abolished.

In the ecclesiastical courts, a series of appeals is provided from the Archdeacon's Court to that of the bishop, and from the bishop to the archbishop. From the archbishop the appeal of right lay to the king in council before the Reformation; yet appeals to the Pope were in fact of common occurrence until the reign of Henry VIII., by whom an appeal was directed to be made to certain delegates named by himself. After that period, a Court of Delegates, appointed for each cause, was the ordinary appellate tribunal, until the abolition of their jurisdiction by the late act alluded to above, by which it is further provided, that no Commission of Review shall hereafter issue, but that the decision of the king in council shall be final and conclusive.

Such are the principal heads of appeal, to which we may add the appellate jurisdiction of the justices of the peace assembled at the Quarter Sessions, to whom various

statutes have given authority to hear, upon appeal, the complaints of persons alleging themselves to be aggrieved by the orders or acts of individual magistrates.

APPEAL (*appeller*, to accuse), in the old criminal law of England, was a vindictive action at the suit of the party injured by some heinous offence, in which the appellant, instead of merely seeking pecuniary compensation as in civil actions, demanded the punishment of the criminal.

It differed from an indictment in some material points. Being a proceeding instituted by a private person in respect of a wrong done to himself, the prerogative of the crown was not permitted to suspend the prosecution or to defeat it by a pardon. It seems to have been in reference to this peculiarity that the appeal is said to have been called by the celebrated Chief Justice Holt 'a noble birthright of the subject,' inasmuch as it was the only mode by which the subject could insist upon the rigorous execution of criminal justice without the risk of royal interposition on behalf of the offending party. Even a previous acquittal on an indictment for the same identical offence was no bar to the prosecution by the appellant; nor was a previous conviction a bar, where the execution of the sentence had been intercepted by a pardon. It was in the power of the appellant alone to relinquish the prosecution, either by releasing his right of appeal, or by accepting a compromise.

Another remarkable feature of appeal was the mode of trial, which in cases of treason or capital felony was either by jury or by *battle*, at the election of the defendant.

Where the latter form of trial was adopted, the following was the order of proceeding. The appellant formally charged the *appellee* with the offence: the latter distinctly denied his guilt, threw down his glove, and declared himself ready to prove his innocence by a personal combat. The challenge was accepted by the appellant, unless he had some matter to allege, in what was termed a *counterplea*, showing that the defendant was not entitled to the privilege of battle, and both parties were then put to their oaths, in which the guilt of the accused was solemnly asserted on one side and denied on the other. A day was then appointed by the court for the combat, the defendant was taken into custody, and the accuser was made to give security to appear at the time and place prefixed. On the day of battle, the parties met in the presence of the judges, armed with certain prescribed weapons, and each took a preliminary oath, of which the effect was that he had resorted to no unfair means for securing the assistance of the devil in the approaching contest. If the defendant was vanquished, sentence was passed upon him, and he was forthwith hanged. But if he was victorious, or was able to persist in the combat till starved, or if the appellant voluntarily yielded, and cried *crua*, then the defendant was acquitted of the charge, and the appellant was not only compelled to pay damages to the accused, but was further subjected to very heavy civil penalties and disabilities.

Some of the details of this singular mode of trial, as reported by contemporary writers, are sufficiently ludicrous. Thus we are told that the combatants were allowed to be attended within the lists by *counsel*, and a *surgeon with his ointments*. In the reign of Charles I., Lord Rea, on a similar occasion, was indulged with a seat and wine for refreshment, and was further permitted to avail himself of valuable auxiliaries as *nails, hammers, files, scissors, bodice, needle and thread*. (See Rushworth's *Collections*, cited in Barrington's *Observations*, p. 328.) We also learn from the *Close Rolls* recently published, that parties under confinement preparatory to the trial were allowed to go out of custody for the purpose of practising or taking lessons in fence. (See Mr. Hardy's *Introduction*, p. 185.) The whimsical combat between Horner and Peter, in the second part of *Henry VI.*, has made the proceedings on an appeal familiar to the readers of Shakspeare; and the scene of a judicial duel upon a criminal accusation has been still more recently presented to us in the beautiful fictions of Sir Walter Scott.

It appears probable that the trial by battle was introduced into our jurisprudence from Normandy. The *Grand Coutumier* of that country, and the *Assizes of Jerusalem*, furnish evidence of its early existence.

The courts of criminal jurisdiction in which it was admitted were the King's Bench, the Court of Chivalry, and (in the earlier periods of our legal history) the High Court of Parliament.

In some cases the appellant was able to deprive the accused of his choice of trial, and to submit the enquiry to

jury:— Thus, if the appellant was a female; or under age; or above the age of sixty; or in holy orders; or was a peer of the realm; or was expressly privileged from the trial by battle by some charter of the king; or laboured under some material personal defect, as loss of sight or limb; in all such cases he or she was allowed to state in a counterplea the ground of exemption, and to refer the charge to the ordinary tribunal. The party accused was also disqualified from insisting on his *wager of battle*, where he had been detected in the very act of committing the offence, or under circumstances which precluded all question of his guilt. Indeed (if early authorities are to be trusted) it is far from clear that a criminal, apprehended *in flagranti delicto*, did not undergo the penalties of the law forthwith, without the formality of any trial at all. (See Palgrave's *English Commonwealth*, vol. i. p. 210.) The law on this latter point formed the subject of an interesting discussion in the Court of King's Bench in the year 1818, in the case of *Ashford v. Thornton*. Upon that occasion the defendant had been acquitted upon a prior indictment for the murder of a female, whom he was supposed to have previously violated. The acquittal of the accused upon evidence which appeared to many sufficient to establish his guilt occasioned great dissatisfaction, and the brother and next heir of the deceased was accordingly advised to bring the matter again under the consideration of a jury by the disused process of an appeal. The defendant waged his battle in the manner above described, and the appellant replied circumstances of such strong and pregnant suspicion as (it was contended) precluded the defendant from asserting his innocence by battle. It was, however, decided by the court that an appeal, being in its origin and nature a hostile challenge, gave to the appellee a right to insist upon fighting, and that the appellant could not deprive him of that right by a mere allegation of suspicious circumstances. The case would have proceeded in due course, if the legal antiquaries had not been disappointed of the rare spectacle of a judicial duel by the voluntary abandonment of the prosecution. In the following year an act (59 Geo. III. ch. 46) was passed to abolish all criminal appeals and trial by battle in all cases both civil and criminal.

The cases in which, by the antient law, appeals were permitted, were treason, capital felony, mayhem, and larceny. Indeed, the earliest records of our law contain proofs that appeals were a common mode of proceeding in many ordinary breaches of the peace, which at this day are the subject of an action of trespass. The wife could prosecute an appeal for the murder of her husband; the heir male general for the murder of his ancestor; and in any case the prosecutor might lawfully compromise the suit by accepting a pecuniary satisfaction from the accused. Hence it was that the proceeding was in fact frequently resorted to for the purpose of obtaining such compensation rather than for the ostensible object of ensuring the execution of justice on the offender. (See further, Hawkins's *Crown Law*, book ii. chaps. 23 and 45. *Ashford v. Thornton*, Barnwall and Alderson's *Reports*, vol. i.; Kendal's *Argument for Construing largely*, &c. Bigby v. Kennedy, Sir Will. Blackstone's *Reports*, vol. ii. p. 714; and the ingenious speculations and remarks of Sir F. Palgrave on the origin of trial by battle, in his work on the Commonwealth of England.)

Besides the appeal by innocent or injured parties, a similar proceeding was in certain cases instituted at the suit of an accomplice. The circumstances under which this might be done will be found under the article *APPROVER*.

APPENZELL, the canton of, one of the twenty-two cantons or states which constitute the Swiss Confederation. It lies at the north-eastern extremity of Switzerland, and is enclosed on every side by the territory of the canton of St. Gall. Its shape is nearly circular, except on the north-east, where it forms a projection which extends towards the Rhine and the Boden See, or Lake of Constance, which it almost touches. The whole extent of the canton, according to Francini's *Statistics of Switzerland*, is about 212 English square miles, and its population, which, in the sixteenth century, hardly amounted to 10,000, is now about 58,000. Appenzell is, next to Geneva, the most thickly inhabited canton of Switzerland, in proportion to its extent. Its territory is very mountainous, though it is not within the range of the higher Alpine chains: its mountains are calcareous, and mostly covered with rich pastures; the highest of them, called the Sentis, which rises on the southern border of the canton, is 7700 feet above the level of the sea.

The river Sitter, which has its source at the foot of this mountain, crosses Appenzell in a north-western direction, and afterwards joins the river Thur in the canton of Thurgau. The country of Appenzell produces but little corn, and has no vineyards, except on some of the eastern hills, which slope towards the Rheintal or valley of the Rhine. Numerous herds of cattle and flocks of sheep feed on the high lands of Appenzell; the former amount in summer to 25,000 heads. Butter and cheese are the chief produce of the *inner rhoden* or districts of this country. Honey and wax are also gathered plentifully. In the northern and western districts called *ausser rhoden*, manufactures of linen and cotton cloths, muslins, damask, &c., afford employment to a great part of the population. Herisau and Trogen are the two manufacturing towns of Appenzell. Herisau has between 7000 and 8000 inhabitants, and is a place of considerable wealth.

In its internal administration, Appenzell is divided into two distinct republics independent of each other, called interior and exterior *rhoden*, or communes. The former are Catholic, the others Protestant. The separation took place in 1597, after the wars of religion which raged in Switzerland in the sixteenth century. The two, however, count but as one canton of the Swiss confederation, and have only a single vote in the federal Diet, to which they send deputies each in its turn. Both governments are pure democracies; in each the *landsgemeinde*, or general assembly of all the male natives above eighteen years of age, meets once a year in a field, and constitutes the supreme or legislative power. Two councils constitute the executive; they propose the laws for the acceptance of the general assembly, and exercise also the high judicature of the country, for the two powers, administrative and judiciary, are often blended together in these small democracies. The landamman is the chief magistrate. The revenues of the state are extremely limited; those of the exterior rhoden do not ascend to 1500*l.* sterling annually, and those of the interior rhoden are still less, but the expenses are likewise trifling, for there are no establishments kept up, few public officers are paid, and those but scantily, and no national works are undertaken. The security of these little republics lies in their federal bond with the larger, more populous, and wealthier cantons of Switzerland.

The Protestant or exterior rhoden of Appenzell are more populous and industrious than the interior or Catholic districts, the inhabitants of the latter being chiefly addicted to pastoral life. It ought to be observed, however, that the interior rhoden are the most mountainous and wild, and that the people of these secluded districts, little visited by strangers, have retained much of the primitive Swiss simplicity of manners. The Catholic rhoden have a population of 15,000, while the Protestant rhoden reckon about 43,000. The *landsgemeinde*, or legislative assembly of the latter, musters about 9000 members.

The country of Appenzell was little known till the seventh or eighth century, when the Frankish kings who ruled over eastern Helvetia bestowed the royal or fiscal domains in these mountains and valleys on the Abbey of St. Gall. By degrees the abbey acquired the jurisdiction over the whole country, which was granted to it in 1292, by the Emperor Adolphus of Nassau. The abbots built a monastery dependent on that of St. Gall, which was called Abbatis Cella, and in German Abten-zell, from whence the name of Appenzell was given first to the village which grew around the monastery, and afterwards to the whole country. The inhabitants enjoyed, under the dominion of the abbey, considerable privileges and franchises; they elected their landamman and other magistrates, and the dues and fees they were to pay to the abbey were fixed. But under an elective government, like that of an abbey, much depended on the personal character of the abbot for the time being. Some of the abbots encroached, or allowed their bailiffs to encroach, on the liberties of these mountaineers; they levied fresh taxes on their butter and cheese, and committed various other acts of oppression. The Appenzellers complained, remonstrated, but to no great purpose. The example of their neighbours of the forest cantons, who had thrown off for similar reasons the rule of Austria, encouraged them in their resistance. In 1401, they rose in arms, surprised the castle which the abbot had built in their country, and drove his bailiffs away. A war ensued, in which first the imperial cities of S. Maria, and afterwards Austria itself took the abbot's part, but the

Appenzellers were for their enemies in the defiles of their mountains, and repeatedly defeated them. They were assisted by their neighbours of the forest cantons, by the men of Schwytz and Glarus. The war lasted several years, during which the mountaineers of Appenzell invaded the other territories of the abbot, drove him away from his abbey, overran Thurgau, and even advanced across the Rhine as far as Bregentz, in the Austrian states. At last peace was made, and the Appenzellers were recognized as an independent people; but it was not till the year 1513 that they were finally received into the Swiss confederation, of which they formed the thirteenth canton. They have ever since retained their simple form of government, and with the exception of the French invasion of 1798, have preserved their independence. During the late disturbances which have agitated Switzerland since 1830, the people of Appenzell have remained quiet. (*Geographisches und Historisches Lexicon der Schweiz*. Cox's *Letters on Switzerland*, &c.)

APPENZELL, a town or rather large village in the inner rhoden. It is the capital of the Catholic part of the canton, and the residence of the council of government. It lies in a fine valley on the river Sitter, nine miles south of the town of St. Gall, from which there is a carriage road to it. Appenzell has two inns for travellers. Its population is about 3000. It has a convent of capuchins, and a monastery of nuns of the order of St. Clara. The mineral springs of Weissbad rise about two miles south of Appenzell. The air of this country is remarkably clear and pure; often when the low lands of Thurgau, and the banks of the lake of Constance, are enveloped in mist, Appenzell enjoys a bright sun and sky. The village and district of Gaiss, four miles N.E. of Appenzell, are celebrated as places of resort for invalids, who come here in summer to breathe the salubrious air of this elevated region, and to drink the whey which is brought warm every morning from the *chalets* or dairies of the Alps. Gaiss is about 3000 feet above the level of the sea.

APPIANUS, a native of Alexandria, in Egypt, the author of an extensive history of the Roman empire, in the Greek language. The time in which he lived may be fixed from several passages in his writings. In the preface (c. 7) he speaks of an interval of two centuries between the dictatorship of Cæsar (49 or 47 B.C.) and the time when he wrote his history, which brings us to the reign of Antoninus Pius (138-161 A.D.). The date of 'nearly nine centuries' from the foundation of Rome (c. 9) leads to the same result. Moreover, he speaks of Hadrian as no longer alive, in two separate passages (*Iberica*, 38; and *Bell. Civ. l.*, 38). On the other hand, he mentions the terrible vengeance which Trajan and his generals inflicted on the Jews in the last year of his life (116, 117, A.D.), as occurring in his own time (*Bell. Civ. ii.* 90). Appian practised as an advocate at Rome under more than one emperor; and he so far won the favour of the court, that he was sent to his native country in the important office of procurator or imperial treasurer, if indeed he was not præfectus augustalis, or governor-general of the province of Egypt (see his preface, last chapter). His history, instead of embracing the Roman empire as a whole, treats of the several provinces separately, taking them up in succession as they become connected with Roman history, and then giving a continuous account of their relations with Rome. But to make his work a complete whole, he found it necessary to give a preliminary view of Rome under the kings, and to devote a book to the wars of Hannibal, which, running over so many countries, would otherwise have been ludicrously mutilated. The same motive led him to assign five books to the civil wars of Rome. The subjects of his twenty-two books are: 1. the regal period; 2. Italy (west of the Apennines); 3. Samnites; 4. Kelts; 5. Sicily and other islands, particularly Crete and Cyprus; 6. Spain; 7. Hannibal's wars; 8. Carthage and Numidia; 9. Macedonia and Illyria; 10. Greece and the Greek states of Lower Asia; 11. Syria; 12. Pontus; 13. the wars of Marius and Sylla; 14. those of Pompey and Cæsar; 15 and 16. the wars against the assassins of Cæsar; 17. those between Antony and Augustus; 18. 19. 20. and 21. Egypt; 22. the first century of the empire (including the reign of Vespasian). He appears also to have added afterwards histories of Dacia, Arabia, Judæa, chiefly in reference to Trajan. He speaks also of a history of his own life (Preface, c. 15). Of these, the sixth, seventh, eighth, the latter part of the ninth, the eleventh, twelfth, and those

on the Civil Wars, still exist, besides some fragments of the others. We have purposely omitted the *History of Parthia*. The work entitled *Parthica*, which is usually published with his works as part of the eleventh book, consists merely of extracts from Plutarch's *Lives of Cræsus and Antony*, to which some impostor of the middle ages has prefixed a short prefatory introduction, stolen from Appian's *Syrian History*. The spurious *Parthica* appears to have existed already in the copy of Appian belonging to Photius, who died in 891. The extraordinary similarity between the supposed work of Appian and the acknowledged works of Plutarch had been long observed, and had done serious injury to the reputation of Appian. H. Stephanus, Scaliger, Casaubon, speak of him as a convicted plagiarist. On the other hand, Xylander, Freinsheim, Reimar, hold him innocent, and their opinion has been supported by some strong arguments in an essay affixed by Schweighæuser to his excellent edition. The very insertion of the Parthian history in the eleventh book with Syria is contrary to the plan of Appian's work, as the Romans had no relations with Parthia before the Mithradate war, which is the subject of the twelfth book; and what is more decisive upon this point, he more than once in his *Civil Wars* (ii. 18, and v. 65) mentions his *intention* to treat of the Parthians in a *later* part of his work.—The *Parthian history will show*, &c. These and other arguments may be seen in the essay of the German editor. Appian's long professional residence at Rome, as well as his Roman name, afford evidence that he had one advantage over Plutarch as an historian, in possessing a perfect knowledge of the Latin language; but his merits in other respects are not great. His views of history are in general very superficial; and as a geographer, his ignorance is startling, when compared with the means of information which his age and circumstances offered. In speaking of the second Punic war (*Iberica*, 7), he places Saguntum (Murviedro) on the north of the Iberus, an error indeed into which Polybius may have led him. The same mistake appears again in c. 10; and in c. 12 the climax of confusion is completed by the supposition that Saguntum is the same city as Carthage. Spartagena (Carthagena). In the very same book, c. 6, it is asserted that the Iberus (Ebro) empties itself into the Northern Ocean; in c. 1, that Spain extends 10,000 stadia in length, and as much in breadth (thus making the surface of the country at least four times as large as it really is); and that the passage from thence to Britain is made in but a day by the tide alone.

A wretched translation of Appian into Latin was published in 1472 by Candidus, at Venice. The first edition of part of the Greek text was given at Paris in 1551 by Casaubon, with the assistance of his brother Robert. In 1554, an improved Latin translation by Gelenius was published at Basle. But these editions were all imperfect. The *Spain* and *Hannibal* were first published by H. Stephanus at Paris, in 1557. Some fragments were added by Ursinus at Antwerp, in 1582; the *Illyria*, by Hæschelinus at Augsburg, in 1599; and some more fragments by H. Valesius at Paris, in 1634. The best edition is that of Schweighæuser, Leipzig, 1785, 3 vols., 8vo. This edition contains a Latin translation, taken chiefly from that of Gelenius, and a large body of notes. A. Mai published, in 1815, a letter of Appian to Fronto in the collection of Fronto's letters; and he has also published three small fragments of Appian in the second volume of his *Script. Vet. novæ Collectio*. There is a German translation by F. W. J. Dillenius, 2 vols., 8vo., Frankfurt, 1793-1800; one in French by Claude Seyssel, fol., Lyons, 1544; another by Ode Desmarres, fol., Paris, 1659; and a translation of the five books of the *Civil Wars*, by Combes Dounous, appeared at Paris, 1808, 3 vols., 8vo. An English translation of Appian's *Ancient History*, &c., was printed by Raufe Newbery and Henrie Bynniman, in 1579, 4to.; and a translation by J. D. (Dryden or Davies) was published in folio, 1696.

APPIA VIA, an ancient road in Italy. It was first laid down as far as Capua by Appius Claudius, who afterwards, from the loss of his sight, was called Cæcus, in his censorship, B.C. 312. At a later period, it was continued as far as Brundisium. For the towns through which it passed, see ANTONINE'S ITINERARY, near the end. The road, parts of which still exist, was built of squared stones, closely fitted together without cement or iron, of various sizes from one to five feet. There are two strata beneath: the first of rough stones cemented with mortar, the second of gravel, the whole being about three feet in depth. The

breadth of the road is about fourteen feet, so as to admit two carriages.

APPIUS CLAUDIUS. [See **CLAUDIUS.**]

APPLE, in Botany. [See **PYRUS.**]

APPLE. This fruit, which, from its hardness and great abundance, combined with its excellent flavour, is one of the most important productions of cold climates, is, in its wild state, the austere crab-apple of the hedges. At what period it first began to acquire from cultivation the sweetness and other qualities which are peculiar to it in its domesticated state, or by what accident the tendency to amelioration was first given it, we have no means of ascertaining. All that we know is, that the apple is spoken of by Homer as being one of the fruit trees cultivated in the gardens of Alcinous and of Laertes, that it was a favourite fruit of the Romans, who had many varieties, and that it has never ceased to be an object of great interest with all northern nations.

It is a most inexplicable circumstance, that while some kinds of plants will produce a great multitude of varieties when raised from seed, and are susceptible of an almost unlimited degree of improvement, there are others of very nearly a similar nature which seem almost incapable of varying at all; and yet there are so many instances of it that the fact will not admit of doubt. Among these instances are the apple and the hawthorn: millions of millions of the latter have been raised in this country alone, and yet our gardens do not contain above half-a-dozen well-marked varieties; of the apple, on the contrary, which is, botanically, closely allied to the hawthorn, the varieties are innumerable; in the last edition of the *Catalogue of the Garden of the Horticultural Society*, 1400 are described; and it is probable that this is not more than half the number really known.

In the beginning, varieties, it may be supposed, were produced accidentally, owing to the peculiar tendency to change that this species of fruit possesses. A few varieties once obtained and placed in a garden, their blossoms would be certain to fertilize each other mutually, giving and taking the peculiar properties of one another: if the seeds of these were again sown, a greater degree of variation would arise; and this being repeated from generation to generation, the progeny would soon begin to differ so much from the original parents as scarcely to be recognizable. Until within comparatively a few years, varieties were procured in no other way than in this, and by constantly destroying inferior kinds as better were obtained; but since the discovery of the effect produced by fertilizing one variety with another, a very rapid advance has taken place towards bringing the apple to its highest state of perfection, and the cultivator has no longer to trust to mere chance for the results of his experiments.

In procuring improved varieties of the apple, no other mode which leads to certain results has been discovered, than this of cross-fertilization: but, at the same time, it is believed that the following circumstances ought to be kept in view: 1st, the seed from which the new variety is to be obtained should be fully formed, and 2d, it should be taken from as perfect a specimen as it may be practicable to procure; for it has been found by experience, that any debility or defect in the parent is, in fruit trees, very apt to be communicated to their offspring. No person has been more successful in experiments of this kind than Mr. Knight, the President of the Horticultural Society, who thus describes his method of proceeding. 'Many varieties of the apple were collected, which had been proved to afford, in mixture with each other, the finest ciders; a tree of each was then obtained by grafting upon a paradise stock, and these trees were trained to a south wall, or if grafted on a Siberian crab, to a west wall, till they afforded blossoms, and the soil in which they were planted was made of the most rich and favourable kind. Each blossom of this species of fruit contains about twenty stamens, or males, and generally five pistils, or females, which spring from the centre of the cup, or cavity of the blossom. The males stand in a circle just within the bases of the petals, or flower leaves, and are formed of slender threads, each of which terminates in a small yellow ball, or anther. It is necessary, in these experiments, that both the fruit and seed should attain as large a size, and as much perfection, as possible; and, therefore, a few blossoms only were suffered to remain upon each tree from which it was intended to obtain seeds. As soon as the blossoms were nearly full grown, every male in each was carefully extracted, proper care being taken not to injure the pistils or females; and the blossoms,

thus prepared, were closed again, and suffered to remain till they opened spontaneously. The blossoms of the tree which it was proposed to make the male parent of the future variety were accelerated by being brought into contact with the wall, or retarded by being detached from it, so that those were made to unfold at the required period; and a portion of their pollen or farina, when ready to fall from the mature anthers, was, during three or four successive mornings, deposited upon the pointals of the blossoms, which consequently afforded seeds. It is necessary in this experiment that one variety of apple only should bear un-mutilated blossoms; for where other varieties are in flower at the same time, the pollen of these will often be conveyed by bees to the prepared blossoms; and the result of the experiment will in consequence be uncertain and unsatisfactory.

'Every seed, though many be taken from a single apple, will afford a new and distinct variety, which will generally be found to bear some resemblance to each of its parents. Examples of this are presented in the Grange apple and Downton pippin, and in the Foxley apple and Siberian Harvey.'

Of all the apples cultivated by our ancestors, a very small number only is known to the present generation. This may have been owing to their having gradually given way to better kinds; but, in the opinion of Mr. Knight, it is rather to be ascribed to an expenditure of their vital principle. This distinguished physiologist is of opinion, that no varieties of fruit trees are capable of remaining in perfection beyond a limited number of years: he thinks that after that period they suffer from the debility attendant upon old age, and that, although their existence may be protracted by means of grafting or budding them upon healthy stocks, yet that in the end they will entirely disappear. This opinion is founded upon the well-known fact, that the oldest varieties of the apple are now the most diseased, especially the celebrated golden pippin, which was formerly the common hardy cider-apple of the Herefordshire orchards, but which is now only preserved with difficulty in gardens. But it must be remembered, that however plausible this theory may be, it is open to several objections, among which more especially are the following: it is not impossible that the varieties alluded to by Mr. Knight were originally less hardy than those now cultivated, and that their constitutions were not adapted to the cold summers which generally prevail at the present epoch in England,—a supposition which is rendered the more probable by the circumstance, that the golden pippin still flourishes in all its pristine vigour in the island of Madeira. It may also be conjectured that neglect was a great cause of the disappearance of the golden pippin, and other kinds, from the cider orchards; for if, as is so often the case, the trees were once allowed to fall into a state of decay, then every scion taken from such trees for the purpose of propagation would carry its own debility along with it; and thus a disease, acquired in the first instance by neglect, would be perpetuated according to the well-known laws of vegetable physiology. (See Lindley's *Outline of the First Principles of Horticulture*, p. 24, &c.)

It is not our intention in this place to enter into any detailed account of the varieties of the apple, for which we must refer our readers to works treating exclusively on such subjects, especially to the *Guide to the Orchard and Kitchen Garden*: we shall rather confine ourselves to topics of general interest, such as the selection of varieties for small gardens or orchards, the modes of pruning and planting the trees, keeping the fruit when gathered, and propagation.

England is celebrated for the excellence of its cider; a beverage which perhaps acquires its highest degree of excellence in Herefordshire, and the neighbouring counties. In those districts, it has been found that the best varieties are the *foxwhelp*, a worn-out sort, much used for mixing with other kinds, to which it communicates strength and flavour; the *red must*; the *hagloe crab*, which, however, is only good in a dry soil, on a basis of calcareous stone, in a warm situation and season; the *grange apple*; the *orange pippin*; the *forest styre*, which is supposed to produce a stronger cider than any other, but is not a good bearer: the *yellow Elliot*; the *Bennett*; the *Siberian Harvey*; *Stead's kernel*; the *friar*, which is very hardy; and above all, the *golden Harvey*, or *brandy apple*. The specific gravity of the juice of these varieties has been stated by Mr. Knight to be as follows.

Foxwhelp	1076-1080	Yellow Elliot	1076
Red must	1064	Bennett	1073
Hagloe crab	1081	Siberian Harvey	1091
Grange	1079	Stead's kernel	1074
Orange pippin	1074	Friar	1073
Forest styre	1076-1081	Golden Harvey	1085

Besides these, the *coccagee* and the *Siberian bitter-sweet* are in much estimation.

For the kitchen, the apple is certainly, of all fruits, the most useful; and perhaps it is here that its utility to man is most conspicuous, because it proves, when cooked, a nutritious and wholesome food. In every district there is an abundance of local varieties, which are considered by their cultivators as of peculiar excellence. But for those who are anxious to possess the kinds which have been determined by comparison to be the best of all, we should recommend the following: for summer use, the *Keswick codlin* and the *Hawthornden*; for autumn, the *Wormsley pippin* and the *Alfriston*; for winter and spring, the *Bedfordshire foundling*, *Dumelow's seedling*, *Dr. Harvey*, *Brabant Bellefleur*, and *Gravenstein*; and for drying, the *Norfolk Beaufin*. Of all these, the *Gravenstein*, *Alfriston*, and *Brabant Bellefleur* are the best.

Of table apples, the varieties are endless; but by far the greater part of the local sorts, and of those commonly cultivated, is of only second-rate quality. The finest variety of all is the *Cornish gilliflower*; no other equals this in excellence, but it is unfortunately a bad bearer. Of those which combine productiveness and healthiness with the highest quality, the six following must be considered the best: *golden Harvey*, *old nonpareil*, *Hubbard's pearmain*, *Ribston pippin*, *Dutch mignonne*, *Court of Wick*. Finally, the best selection that could be made for a small garden, so as to obtain a constant succession of fruit from the earliest to the latest season, would be the following, which are enumerated in their order of ripening, the first being fit for use in June, and the last keeping till the end of April.

White Juneating.	Fearn's pippin.
Early red Margaret.	Court of Wick.
White Astrachan.	Golden Harvey.
Sugar-loaf pippin.	Golden pippin.
Borovitsky.	Beachamwell.
Oslin.	Adam's pearmain.
Summer golden pippin.	Pennington's seedling.
Summer Thorle.	Hughes's golden pippin.
Dutchess of Oldenburgh.	Cornish gilliflower.
Wormsley pippin.	Dutch mignonne.
Kerry pippin.	Reinette du Canada.
Yellow Ingestrie.	Syke-house russet.
Gravenstein.	Braddick's nonpareil.
Autumn pearmain.	Old nonpareil.
Golden reinette.	Court-pendu plat.
King of the pippins.	Lamb-Abbey pearmain.
Ribston pippin.	Newtown pippin.

In *pruning* the apple-tree, as indeed in all similar cases, three objects are chiefly kept in view; the first of which is to remove superfluous, or excessively vigorous shoots; the second is to admit light and air to all parts equally; and the third is to check exuberance, and thus to promote fruitfulness. The mode of proceeding in the two first cases is so obvious as not to require explanation; for the third, a few simple rules will suffice. As the apple is a tree of very hardy habits, if its branches are allowed to go unpruned, they will not produce any considerable number of lateral shoots, but will have a great tendency to keep lengthening from their terminal buds, which always produce barren and vigorous shoots; it is the lateral shoots only that are fertile, and they are so only when stunted, or in the state of what are technically called *spurs*. The mode of procedure is then obviously to destroy the terminal barren shoots, and to encourage the lateral fertile ones. This is effected by shortening back all the leading shoots every year, to a distance from their point of origin, which varies according to their strength: where they are very strong, the leading shoots should not be reduced more than within twelve or fifteen inches of their base, but when they are weaker, they may be cut to within nine inches. By this means the onward growth of the branch is momentarily arrested; the ascending sap is impelled into the lateral buds, which are thus developed, and form branches, some of which will be sure to grow so slowly as to become productive; for notwithstanding the check the branch may receive from

the amputation, it will after a little while again lengthen by means of the bud nearest its extremity, and this latter will then grow so fast as effectually to hinder the new lateral shoots from acquiring much vigour. Of the lateral shoots then obtained, some will be required to form new branches others will be reserved for fruiting, and others will at once become fruit spurs; the first will be treated as those from which they sprang, the second are to be cut down to within an inch of the bottom, which will generally cause the surrounding eyes to form fruit spurs; the third will be left until they have borne fruit, when they are cut out so as to leave only a single bud behind. In all cases, the fruit spurs, which, like the leading branches, have a tendency to lengthen, should have that tendency stopped by being cut back to the length of about three inches.

Apple-trees are trained in the form either of *standards*, *dwarfs*, *espaliers*, or *balloons*.

No particular care is requisite in the management of *standards* beyond providing them with a straight stem six feet high, and a head consisting of three or four healthy shoots to commence with; and afterwards keeping the branches so pruned that they do not chafe against each other in windy weather, nor overshadow each other; all the rest is generally provided for sufficiently by nature herself. They are principally employed in planting orchards, being now seldom admitted into good gardens. As these orchards are of inestimable value to the farmer and the peasant, the best mode of planting them cannot be too generally understood: we therefore select, from many others, the following method recommended by Mr. Knight. Let a soil of good quality be selected for a nursery, which should be trenched eighteen inches deep, and planted with seedling crab stocks of one year old, each plant being placed at the distance of six feet from the others. These will be fit for grafting at two years old; and an acre of ground thus planted, will contain about 1500 trees, and, consequently, enough to plant about forty acres, where each tree stands at twelve yards distance from others. A nursery thus planted, when the trees are seven or eight years old from the seed, will form a more productive orchard than can be obtained by any other means with which I am acquainted; and during the earlier periods of the growth of the trees, they will be rather benefited than injured if the ground be planted with potatoes, or other low-growing crops, with proper manure. During the growth of the trees in the nursery, they should not be pruned to single stems, without leaves, as is usually done in nurseries, but each should retain many small lateral branches, which will tend to make the young trees grow strong and taper in their stems, and will afford much fruit whilst the trees are very young. I would recommend the *Downton pippin* for an experiment of this kind, in preference to any other variety.

At the end of eight or nine years from the time when the trees are first planted, they will have covered with their branches the whole surface of the ground, and will then begin to injure each other, if the whole be suffered to remain. At this period, therefore, every other row of trees, and at no distant subsequent period, every other tree in the remaining rows, must be taken away; and if this be done with proper care, and leaving the roots at least two feet long upon each side of the trunks, such trees may be removed with still less risk than such as are much smaller. But to insure success, it will be necessary to take off much the greater part of the lateral branches; and the holes in which the trees are to be planted must be made not less than six feet wide, and eighteen inches deep, placing the turf, if the field be pasture, in the bottom, and taking care that the trees be not planted deeper in the soil than they previously grew. Each tree will require, during the first year, a stake and a few bushes to protect it; after which nothing more will be wanting than to wash its trunk annually with lime and water, and cow dung, to defend it from the teeth of sheep and cattle.

For garden purposes, *dwarf* apple-trees are so far superior to all others, that they are now almost exclusively planted. Independently of the little space they occupy, the small degree in which they overshadow the soil, and the great facility they offer for gathering their fruit, they are generally so much beyond the influence of high winds as to have but little of their crop blown down by autumnal gales, and their fruit is also finer than on standards. No directions for their management can be given better than the

following excellent observations of the author of the *Guide to the Orchard and Fruit Garden*.

Trees for this purpose should have their branches of an equal strength: those which have been grafted one year, or what are termed by nurserymen Maiden plants, are the best; they should not be cut down when planted, but should stand a year, and then be headed down to the length of four or six inches, according to their strength; these will produce three or four shoots from each cut-down branch, which will be sufficient to form a head. At the end of the second year, two or three of the best placed of these from each branch should be selected, and shortened back to nine, twelve, or fifteen inches each, according to their strength, taking care to keep the head perfectly balanced (if the expression may be allowed), so that one side shall not be higher nor more numerous in its branches than the other; and all must be kept, as near as may be, at an equal distance from each other. If this regularity in forming the head be attended to and effected at first, there will be no difficulty in keeping it so afterwards, by observing either to prune to that bud immediately on the inside, next to the centre of the tree, or that immediately on the outside. By this means, viewing it from the centre, the branches will be produced in a perpendicular line from the eye; whereas, if pruned to a bud on the right or left side of the branch, the young shoot will be produced in the same direction; so that if the branches formed round a circle be not thus pruned to the eyes, on the right successively, or the left successively, a very material difference will be found, and the regularity of the tree will be destroyed in one single year's pruning; which may be readily illustrated thus:—fix four branches, either in a direct line or to a circular hoop, at the distance of eight inches from each other; let the branch on the left be called *a*, the second *b*, the third *c*, the fourth *d*; head down *a* to the left-hand bud; *b* to the right, *c* to the left, and *d* to the right. When these have grown a year, those between *a* and *b*, and between *c* and *d*, will be ten inches: thus the distances now are not as eight to eight, but as six to ten; which would require two years' pruning in a contrary direction to restore the head to its former regularity; and it must not be forgotten that this system of pruning will hold good in every other case.

What has just been said has reference only to the leading shoots, which are always produced from the terminal buds when pruned, and which alone form the figure and beauty of the tree. The intermediate space must of course be provided for at the same time, having a regard to the number of branches thus employed, that they do not crowd each other. On the contrary, they must be kept thin, and perfectly open, so as to admit plenty of sun and air, without which the fruit produced will be small and good for but little: the middle of the tree, indeed, must be kept quite open from the first to the last, taking care that all the surrounding branches lead outwards, and preserve a regular distance from each other.

Espalier apple-trees were formerly much used, but they are in all respects so greatly inferior to dwarfs, and so much more expensive to keep in good order, that we omit all further notice of them.

A mode of managing apple-trees called *Balloon* training has been much recommended. It consists simply in this: you plant a common standard tree, with a stem six or seven feet high, and with five or six good equal-sized branches; to the tip of each branch is to be attached a cord which passes under a peg driven into the ground near the stem, and by means of which the branches may be gradually drawn downwards so as to become inverted, when, from the breadth of the part of the tree whence the branches diverge, and the approximation of their points, the whole assumes the appearance of a balloon. All the care that these trees require is, to have their branches kept at equal distances by means of a hoop, or some such contrivance, until they are strong enough to preserve their acquired direction, and to have all the shoots which will every year spring upwards from them carefully cut away, except such as can be brought down so as to fill up the spaces in the circumference of the balloon head. Trees thus managed produce an abundance of spurs, and when loaded with fruit are beautiful objects; like dwarfs, they occupy but little room, and their crop is not liable to be blown down; but they have this very great disadvantage, that all their buds are exposed to the sky in the spring, when they flower; consequently they are liable to suffer very much from the effect of spring

frosts; so that they will scarcely ever bear, except in very favourable seasons, or in very mild and sheltered places. It is, in fact, only into gardens sloping to the south or south-west, and on the sides of valleys, that balloon apple-trees should be admitted.

Many different methods of *preserving* apples have been recommended, and almost every one has some favourite plan of his own. As far as our own experience goes, the best mode is to allow the fruits, after being gathered, to lie till their superfluous moisture has evaporated, which is what is technically called *sweating*; the apples should then be wiped quite dry, wrapped in tissue paper, and stowed away in jars or chests of pure silver sand which has been previously dried in an oven. They should always be taken out of the sand a few days before they are wanted, and laid in dry fern or some such substance; they then absorb oxygen, and acquire a little sweetness, which is necessary to their perfection.

The apple is *propagated* by either budding or grafting; the former practice is preferable for standards, the latter for dwarfs. The stocks that are employed are the wild crab, the doucin or English paradise, and the French paradise apple. The former should be used for standards only, as it imparts too much vigour to the scions to render them manageable as dwarfs; the French paradise should always be employed for the latter, as it has the property of stunting the shoots, and rendering them much more fertile. The doucin or English paradise stock, which is what the English nurserymen usually sell as *the* paradise stock, is intermediate in its effect between the crab and the French paradise, being less vigorous than the first and more so than the last. When there is no wish to confine the dwarf trees within a very narrow compass, this kind of stock, which is harder than the French paradise, is the proper one to employ; but if the dwarfest trees that can be procured are the objects of the cultivator, then the latter only should be planted.

In conclusion, it is only necessary to add that the proper season for planting the apple is in October or November, as soon as the leaves are dead or discoloured, and beginning to drop. Vegetation at that season is not altogether torpid, but goes on just enough to enable the plants to send out a few rootlets before winter, and to prepare themselves for taking advantage of the first period of growth in the succeeding spring—a period, the commencement of which is never exactly known by external indications.

APPLE, LOVE. [See LOVE APPLE.]

APPLE, PINE. [See PINE APPLE.]

APPLEBY, a market town and borough in the county of Westmoreland, of which it is the capital; 270 miles N.N.W. from London, and 31 S.E. of Carlisle, 54° 35' N. lat., 2° 28' W. long. It is upon the river Eden, which falls into the Solway Frith below Carlisle; and is by no means of such extent or importance as formerly. It is supposed by some that Appleby was a Roman station, but there is at least no decisive evidence of this; and no Roman antiquities have been discovered. It was, however, a place of some importance before the conquest, and continued to be so until the time of Henry II., in the 22d year of whose reign it was surprised and utterly destroyed by William, King of Scotland. A second calamity of a similar kind in the 12th year of Richard II., A.D. 1388, completed the misfortunes of Appleby*. It never recovered from this blow. The greatest part still lay in ruins in the time of Philip and Mary, and on this account the rent due to the crown was reduced from twenty marks annually to two marks, or 1*l.* 6*s.* 8*d.* Burials, a small place at the distance of nearly a mile, is supposed to be derived from Burgh walls; and the remains of buildings have been dug or ploughed up two or three miles from where the town now stands.

Appleby contains two parishes, St. Lawrence on the left, and St. Michael on the right side of the river. In St. Lawrence is the greater part of the town; in St. Michael a few houses only which can be considered part of the town, the parish of St. Michael being an agricultural one. The parishes are separate vicarages. The high road from London to Carlisle through Brough and Pearth passes through the latter; and a short street and an ancient stone bridge of two arches over the Eden lead into the main street of Appleby, which is irregularly built on the slope of a hill. The castle

* There is some difference in the dates assigned to the first of these events. Nicolson and Burn (*Hist. of Cumberland and Westmoreland*) give the 22d of Henry II.: but it was in this year that the fine for delivering up the place was levied on the governor, and the event might have occurred a year or two before.

stands on a lofty height rising from the river at the upper end of the main street, and at the lower end is the parish-church of St. Lawrence. The keep of the castle is in good preservation. It is called Cæsar's Tower, but is not of Roman origin, though it is of great antiquity. The principal part of the present edifice was built in 1686, by the then Earl of Thanet, in whose family it still remains. The church of St. Lawrence was nearly rebuilt in 1655, by the Countess of Pembroke. Near the church is the market-house, rebuilt in 1811 in the Gothic style. The town-hall and shambles are incommodiously placed in the middle of the main street: at each end of the town is an antient stone obelisk. The shire-hall and new gaol are in the parish of St. Michael or Bondgate, in the part of Appleby which lies on the north-east or right bank of the Eden. Both the Lent and Summer assizes are held here, and the judges when on circuit have from time immemorial been entertained at the castle.

Towards the upper end of the town is an almshouse or hospital, for twelve widows and a superior, or 'mother,' founded by the above-mentioned Countess of Pembroke; and near the church is a grammar-school, established in the time of Elizabeth. The income of the school is or was 204*l.* 1*s.* 7*d.*; the number of free scholars is six. (*Digest of Reports, &c. on Public Charities*, p. 622.)

The market is on Saturday, chiefly for corn; and there are several fairs for cattle, horses, sheep, and linen-cloth; especially a cattle-fair once a fortnight from Whitsun-eve to Michaelmas. The population of the borough of Appleby was, in 1831, 851, and of the township of Bondgate and Langton 645, together 1496: but the parishes of St. Lawrence and St. Michael had 1459 and 1264 inhabitants respectively.

The corporation consists of a mayor, twelve aldermen, sixteen common-councillmen, and other officers. The borough returned two members up to the passing of the Reform Bill, by which it was disfranchised.

Appleby was distinguished by its adherence to Charles I. in the contest between that prince and his parliament. The Countess of Pembroke fortified the castle for the king, but it was forced to surrender.

APPOGGIATU'RA, in music (from the Italian verb *appoggiare*, to lean on), commonly called a grace note, or note of embellishment, but more correctly, a note of expression. This is invariably written in a smaller character than the essential notes of the melody. The term explains itself; the *appoggiatura* should always have more or less pressure of the breath or hand, being, where the notation is accurate, used for the purposes of emphasis, especially in recitative, where it is quite as important as the notes in a larger character. But in recitative it is a practice as common as erroneous, to write notes *not* meant to be sung, presuming that the singer will suppose notes to be intended which are not represented. Thus Handel, in his *Jephtah*, has written a recitative in the following manner:—

The musical notation consists of four staves. The first staff shows the lyrics 'Such news flies swiftly, I've' with a grace note on 'flies'. The second staff shows 'heard the mourn-ful cause of all your sor-rows--' with a grace note on 'mourn-ful'. The third staff shows 'but meant it to be sung thus:—' with a grace note on 'meant'. The fourth staff shows 'Such news flies swift-ly, I've' with a grace note on 'flies'. The lyrics are written below the notes.

It may however be a question, whether a note having a syllable appropriated solely to it, can properly be called an *appoggiatura*; but all writers on the subject do, nevertheless, so term it.

The *appoggiatura* takes its length, or duration, from the note it precedes, whence it almost invariably abstracts one-

half; except in the case of a dotted or pointed note, from which it takes two-thirds. Example:—

The musical notation shows two staves. The first staff is labeled 'As written.' and shows a note with a grace note. The second staff is labeled 'As performed.' and shows the same note with the grace note written as a very short note, indicating it is to be performed as such.

Occasionally, the small note is not only written, but intended to be performed, as a very short one. For instance: a small semiquaver sometimes precedes a crotchet, or a minim, where, if it leap from a distance above to the principal note, which is rare, it is merely a note of animation. If it be the semitone, the octave, or indeed any interval below the principal note, it is then called an *acciaccatura*, or *crushing* note, (from *acciaccare*, to crush, to pound,) and is to be forced and short. The *appoggiatura*, M. Framery observes, gives tenderness to the air; it therefore is not adapted to music of an energetic or majestic kind. In the hands of an accomplished performer it is the most expressive, the most impassioned, addition intrusted to his discretion. But modern composers, unwilling, perhaps, to repose too much confidence in those who are to execute their works, generally write all that they mean to be introduced, trusting nothing to the judgment of the performer.

APPRAISEMENT, from *apprécier*, *appriser*, or *appraiser*, 'to set a price upon an article.' When goods have been taken under a distress for rent, it is necessary, in order to enable the landlord to sell them according to the provisions of the statute 2 William and Mary, sess. i. c. 5, that they should be previously appraised or valued by two appraisers. These appraisers are sworn by the sheriff, undersheriff, or constable, to appraise the goods truly according to the best of their understanding. After such an appraisal has been made, the landlord may proceed to sell the goods for the best price that can be procured. By the statute 48 Geo. III. c. 140, an *ad valorem* stamp duty is imposed upon appraisements.

APPRAISERS are persons employed to value property. By the statute 46 Geo. III. c. 43, it was first required that any person exercising the calling of an appraiser should annually take out a license to act as such, stating his name and place of abode, and signed by two commissioners of stamps. By the same statute a stamp duty of 6*s.* was imposed upon such licenses; and unlicensed persons were forbidden to act as appraisers under a penalty of 50*l.* The same duty has been continued by the General Stamp Act 48 Geo. III. c. 149.

APPRENTICE, from *apprendre*, to learn, signifies a person bound by indenture to serve a master for a certain term, receiving in return for his services, instruction in his master's profession, art, or occupation. In addition to this, the master is usually bound to provide the necessary food and clothing for the apprentice, and sometimes to pay him small wages, but most commonly the master receives a premium. Formerly the word was used to denote those students of the common law in the societies of the inns of court who—not having completed their professional education by ten years study in those societies, at which time they were qualified to leave their inns and to execute the full office of an advocate, upon being called by writ to take upon them the degree of serjeant-at-law—were yet of sufficient standing to be allowed to practise in all courts of law except the court of Common Pleas. This denomination of apprentice (in law Latin, *apprenticii ad legem nobiliores*, *apprenticii ad barrat*, or simply *apprenticii ad legem*) appears to have continued until the close of the sixteenth century, after which this term fell into disuse, and we find the same class of advocates designated, from their pleading without the bar, as *outer barristers*, now shortened into the well-known term, *barristers*. (See Spelman's *Gloss. ad verbum*; Blackstone's *Commentaries*, vol. i. 23; vol. iii. 27.)

Apprenticeship appears to have been unknown to the ancients; and although it has been stated that in Rome the distribution of the citizens into companies or colleges according to their trades took place at an early period, we can discern in the Roman history no distinct traces of such a system as apprenticeship. Its origin is to be sought in

the institutions of modern Europe, and it probably sprung up in conjunction with the system of associating handicraft trades in the twelfth century, the natural result, perhaps, of those more general combinations of citizens or of burghesses, which were formed for the purposes of mutual protection against feudal oppression. The restraint of free competition, the assertion of peculiar privileges, and the limitation of the numbers of such as should participate in them, were the main results to which these institutions tended; and for these purposes a more obvious or effective instrument than apprenticeship could hardly be found. To exercise a trade, it was necessary to be free of the company or fraternity of that trade; and as the principal if not the only mode of acquiring this freedom in early times was by serving an apprenticeship to a member of the body, it became easy to limit the numbers admitted to this privilege, either indirectly by the length of apprenticeship required, or more immediately by limiting the number of apprentices to be taken by each master. So strict in some instances were these regulations, that no master was allowed to take as an apprentice any but his own son. In agriculture, apprenticeship, though in some comparatively later instances encouraged by positive laws, has never prevailed to any great extent, which is probably to be attributed to its origin as a part of the system of associated trades. The tendency to association indeed is not strong among the agricultural population, combination being, to the scattered inhabitants of the country, inconvenient and often impracticable; whereas the inhabitants of towns are, by their very position, invited to it.

Subsequently to the twelfth century, apprenticeship has prevailed in almost every part of Europe. In France, Germany, Italy, and Spain, it may be distinctly traced, and it probably existed in various other countries. It is asserted by Adam Smith, that seven years seem antiently to have been all over Europe the usual term established for the duration of apprenticeships in most trades. There seems, however, to have been no settled rule on this subject, for there is abundant evidence to show that the custom in this respect varied not only in different countries, but in different incorporated trades in the same town.

In Italy, the Latin term for the contract of apprenticeship was *acconventatio*. From an old form of an Italian instrument, given by Beier in his learned work *De Collegiis Opificum*, it appears that the contract, which in most respects closely resembled English indentures of apprenticeship, was signed by the father or other friend of the boy who was to be bound, and not by the boy himself, the latter testifying his consent to the agreement merely by being present.

In France, the trading associations prevailed to a great extent under the names of 'Corps de Marchands' and 'Communautés.' At the latter end of the seventeenth century, there were in Paris six 'Corps de Marchands,' and one hundred and twenty-nine 'Communautés,' or companies of tradesmen, each fraternity having their own rules and laws. Among these bodies the duration of apprenticeship varied from three to eight or ten years. It was an invariable rule in the 'Corps de Marchands,' which was generally followed in the 'Communautés,' that no master should have more than one apprentice at a time. There was also a regulation that no one could exercise his trade as a master until, in addition to his apprenticeship, he had served a certain number of years as a journeyman. During the latter term he was called the 'compagnon' of his master, and the term itself was called his 'compagnonage.' He had also, before being admitted to practise his trade as master, to deliver to the 'jurande,' or wardens of the company, a specimen of his proficiency in his art, called his 'chef d'œuvre.' He was then said 'aspirer à la maîtrise.' The sons of merchants living in their fathers' house till seventeen years of age, and following his trade, were reputed to have served their apprenticeship, and became entitled to the privileges incidental to it without being actually bound. These companies or associations were finally abolished at the revolution, when a perfect freedom of industry was recognized by the laws, and this, with a few exceptions, has continued to the present day. But though the contract of apprenticeship has ceased in France to be imperative upon the artisan, it has not fallen into disuse; and an act passed the 12th of April, 1803, prescribes the rights and duties both of master and apprentice. It does not, however, lay down any particular form, and leaves the

time and other conditions of the contract to be determined by the parties.

In Germany, though we find the same institution, it varies not only in the name, but has some other remarkable peculiarities. The companies there called *gilden*, *zünfte*, or *innungen*, appear to have exercised in many respects a sort of judicial control over their members, and, either on account of moral or physical defects, to have refused admission to applicants for freedom at the discretion of the elders or masters. They seem to have occasionally admitted workmen who had not served a regular apprenticeship into the lower class of members of a trade; but to become masters was only allowed to those who had gone through the regular stages of instruction. The course which continues to the present day is as follows:—The apprentice, after having served the term prescribed by his indenture (*aufdings-brief*), is admitted into the company as a companion (*gesell*), which corresponds in many respects to the French *compagnon*. Having passed through the years of his apprenticeship, called *lehr-jahre*, satisfactorily, he becomes entitled to receive from the masters and companions of the guild a certificate, or general letter of recommendation (*kundschaft*), which testifies that he has duly served his apprenticeship, and has been admitted a member of the company, and commands him to the good offices of the societies of the same craft, wherever he may apply for them. With this certificate the young artisan sets out on his travels, which often occupy several years, called *wandel-jahre*, supporting himself by working as a journeyman in his particular art or trade in the various towns in which he temporarily establishes himself, and availing himself of his *kundschaft* to procure admission into the fellowship and privileges of his brother workmen of the same craft. On his return home, he is entitled, upon producing certificates of his good conduct during his *wandel-jahre*, to become a master. In Germany, the periods of servitude have varied in different states and at different periods; in general, the term is seven years; but in some instances an apprenticeship of five or three years is sufficient.

Neither in Ireland nor in Scotland have the laws relating to associated trades or apprentices been very rigorously enforced. In the former, the same system of guilds and companies certainly existed; but, as it was the policy of the English government to encourage settlers there, little attention was paid to their exclusive privileges; and in 1672 the Lord Lieutenant and Council, under authority of an Act of Parliament, issued a set of rules and regulations for all the walled towns in Ireland, by which any foreigner was allowed to become free of the guilds and fraternities of tradesmen on payment of a fine of 20s. A statute containing very similar enactments was passed in 19 George III. The term of apprenticeship, also, in Ireland, was of a moderate length, five years being required by 2 Anne, c. 4, for the linen manufacture, which, by 10 George I., c. 2, was reduced to four years. It is asserted by Adam Smith, that there is no country in Europe in which corporation laws are so little oppressive as in Scotland. Three years are there a common term of apprenticeship even in the nicer trades, but there is no general law on the subject, the custom being different in different communities.

It is, perhaps, impossible to ascertain precisely at what time apprenticeships first came into general use in England. But that the institution is one of very old date is certain, being probably contemporaneous with the formation of the guilds or companies of tradesmen. In the statutes of the realm, however, there is no reference to such an institution for about 200 years after the guilds are known to have existed, apprentices being first incidentally noticed in an act (12 Rich. II. c. 3) passed in 1388. But that about this time apprenticeship had become extremely common is proved by a statute passed in 1405-6 (7 Henry IV. c. 17), which contains the singular enactment, that no one shall bind his son or daughter apprentice unless he have land or rent to the value of 20s. by the year; the cause of which provision is stated to be the scarcity of labourers in husbandry, in consequence of the custom of binding children apprentices to trades. In the act (8 Henry VI. c. 11) which repealed this statute in favour of the city of London, the putting and taking of apprentices is stated to have been at that time a custom of London time out of mind. The same statute was repealed (by the 11th Henry VII. c. 11) in favour of the citizens of Norwich, and (by the 12th Henry VII. c. 1) in favour of the worsted-makers of Norfolk; and in the former

act we find the first mention of any particular term of servitude, the custom of the worsted-sheerers of Norwich being confirmed by it, which required an apprenticeship of seven years. Except in London, it does not appear that at an early period there was in England any uniform practice in this respect, but that the duration of the apprenticeship was a matter for agreement between the parties to the contract. In Madox's *Formulare Anglicanum*, there is an indenture of apprenticeship dated in the reign of Henry IV., which is nearly in the same form as the modern instrument; and in that case the binding is to a carpenter for six years. It is, however, probable that before the statute of the 5th Eliz. c. 4, the term of apprenticeship was seldom less than seven years. In London, the period of seven years at the least was expressly prescribed by the custom as the shortest term; and Sir Thomas Smith, in his *Commonwealth of England*, written about the time of the passing of the statute of Eliz., says, in reference to the previous practice, that the apprentice 'serveth, some for seven or eight years, some nine or ten years, as the master and the friends of the young man shall think meet, or can agree together.'

The statute of the 5 and 6 Edw. VI. c. 8, which enacts that no person shall weave broad woollen cloth, unless he have served a seven years' apprenticeship, may be adduced as a further proof that this term was fast becoming the customary one, when, by the 5th Eliz. c. 4, it was made the law of the land, and one uniform practice in all trades introduced throughout England. But neither by that statute, nor by the customs of London and Norwich, which were excepted by the act, was a longer term of apprenticeship than seven years forbidden.

The London apprentices, in early times, were an important, and often a formidable body. They derived consequence from their numbers, the superior birth of many of them, and the wealth of their masters, but particularly from their union, and the spirit of freemasonry which prevailed among them. The author of a curious poem published in 1647, entitled *The Honour of London Apprentices*, observes, in his preface, that 'from all shires and counties of the kingdom of England and dominion of Wales, the sons of knights, esquires, gentlemen, ministers, yeomen, and tradesmen, come up from their particular places of nativity and are bound to be prentices in London.' He also mentions 'the unanious correspondence that is amongst that innumerable company.'

It may be readily supposed that such a body, in the midst of a large metropolis, densely crowded with population, and frequented by strangers of all kinds, was not a little obnoxious to the police; and accordingly, we find in the sixteenth and seventeenth centuries a constant succession of tumults, and some instances of serious and alarming insurrections arising among the apprentices. Thus the fatal riot in London against foreign artificers, which took place on the 1st of May, 1517, and from which that day was called 'Evil May Day,' was commenced and encouraged by the apprentices.

In the year 1595, certain apprentices in London were imprisoned by the Star-Chamber for a riot; upon which, several of their fellows assembled and released them by breaking open the prisons. Many of these were taken and publicly whipped by order of the Lord Mayor. This caused a much more formidable disturbance; for 200 or 300 apprentices assembled in Tower-street, and marched with a drum in a warlike manner to take possession of the person of the Lord Mayor, and, upon the principle of retaliation, to whip him through the streets. Several of the ringleaders in this riot were tried and convicted of high treason. (See *Criminal Trials*, vol. i. p. 317.)

In the troubles of the civil wars the apprentices of London took an active part as a political body; numerous petitions were presented from them to the parliament, and they received the thanks of the House 'for their good affections.' Nor did they confine their interference merely to petitions, but, under sanction of an ordinance of parliament promising to them security against forfeiture of their indentures, they were enrolled into a sort of militia. They also took part in the restoration, and in the reign of Charles II. they were frequently engaged in tumults. The last serious riot in which they were concerned took place in 1668. On this occasion they assembled themselves tumultuously together during the holidays, and proceeded to pull down the disorderly houses in the city. For this exploit, several of them were tried and executed for high treason.

In 1681, when Charles II. was desirous of strengthening his hands in every way against the corporation of London, he thought it necessary to endeavour to secure the favour of the apprentices, and sent them a brace of bucks for their annual dinner at Sadlers' Hall, where several of his principal courtiers dined with them. The apprentices, however, were divided in opinion; for there were numerous petitions from them both for and against the measures of the court.

Subsequently to this time their union appears to have been gradually dissolved, and we do not find them again acting together in a body. After they had ceased however to form a separate class, the laws which had called them into existence, though partially repealed as to some trades, continued generally in force; nor was it until a very late period that the progress of more liberal opinions finally put an end to them. But the exclusive spirit which had dictated them was so far modified by the spirit of English liberty, that the monopolies upheld by them were never so strictly enforced, nor the evil of them so much felt in this country as on the continent. For not only were the apprentice-laws condemned by the liberal and speculative philosopher, but they found no favour in the courts of law. They were frequently reprobated by judges and legal writers; and Lord Mansfield denounced them as being 'against the natural rights of man, and contrary to the common law rights of the land.' Acting upon this view of the impolicy of the system, the decisions of the courts tended rather to confine than to extend the influence of the statute of Elizabeth, and thus the operation of it was limited to market-towns, and to those trades which were actually in existence at the time it was passed. And although, in consequence of this doctrine, many absurd anomalies and inconsistencies were introduced, yet the exclusion of some manufactures, and particularly of the principal ones of Manchester and Birmingham, from the operation of the act, had probably a favourable effect in causing it to be less strictly enforced even against those who were held to be liable to it. It was proved by a mass of extremely interesting evidence produced before a committee of the House of Commons in 1814, that the provisions of the statute of Elizabeth neither were, nor could be, carried into effect in our improved state of trade and manufactures. An alteration in the law could therefore be no longer delayed. And though the question was brought before the legislature on a petition praying that the 5th Eliz. c. 4, might be rendered more effectual, the result was the passing of an act (54 Geo. III. c. 96) by which that statute, so far as it enacts that no person shall exercise any trade without having served a seven years' apprenticeship to it, was wholly repealed. There is in the act of 54 Geo. III. c. 96, a reservation in favour of the customs and bye-laws of the city of London, and of other corporate towns, but in general the necessity of apprenticeship, as a means of access to particular trades, is abolished, and a perfect liberty, in this respect, is established.

Apprenticeship, though no longer absolutely necessary, still continues to be the usual mode of learning a trade, and as such is recognised by law; it may therefore be useful to mention, in a summary manner, some of the leading provisions of the law upon the subject. By the common law, an infant, or person under the age of twenty-one years, being unable to contract any obligation except for his own benefit, cannot bind himself apprentice so as to entitle his master to an action of covenant for departing his service, or other breaches of the indenture. The statute of 5 Eliz. c. 4, s. 42 and 43, enacts that every person bound by indenture according to the statute, although without the age of twenty-one, shall be bound as amply, to every intent, as if he were of full age. But by these words of the statute, the infant is not so bound as that a remedy lies against him upon any covenant of the indenture; and it has therefore been a common practice for a relation or friend to be joined as a contracting party in the indenture, and engaging for the faithful discharge of the agreement. But by the custom of London, an infant, unmarried and above the age of fourteen, may bind himself apprentice to a freeman of London, and it is said that, by force of the custom, the master may have such remedy against him as if he were of full age, and consequently an action of covenant. Any person under the age of twenty-one years is, by 5 Eliz. c. 4, s. 35 and 36, compellable to be bound apprentice, if so required by any householder using half a plough of land in tillage. The same act also provides that the binding must be by

indenture, so that binding by deed-poll, or by an agreement to execute an indenture, or a parol binding, have been held not to constitute an apprenticeship, though, by statute 31 Geo. II. c. 11, a binding by deed not indented will enable a person to gain a settlement.

By statute of 43 Eliz. c. 2, confirmed by 8 and 9 Wm. III. c. 30, and by subsequent acts, the churchwardens and overseers of a parish, with the assent of two justices of the peace, may bind children of paupers apprentices till the age of twenty-one, and not only persons in husbandry and trade, but gentlemen of fortune and clergymen may be compelled to take them. But if such master is dissatisfied, he may appeal to the sessions. Parish apprentices may also be bound (2 and 3 Anne, c. 6) to the sea service; and masters and owners of ships are obliged to take one or more according to the tonnage of the vessel. Various regulations have been made by several acts of parliament, and in particular by 56 Geo. III. c. 139, for ensuring that parish apprentices shall be bound to proper masters, and securing them from ill-treatment. A settlement is gained by apprentices in the parish where they last resided forty days during the service. (13 and 14 Car. II. c. 12.) [See POOR LAW and SETTLEMENT.]

An indenture cannot be assigned over, either by common law or equity, but by custom it may. Thus, by the custom of London and other places it may be done by a 'turn-over'. Parish apprentices may also, (32 Geo. III. c. 57, s. 7,) with the consent of two justices, be assigned over by indorsement on the indentures.

An indenture is determinable by the consent of all the parties to it; also by the death of the master, apprenticeship being a personal trust between master and servant. But it is said that the executor may bind the apprentice to another master for the remainder of his term. And if there is any covenant for maintenance, the executor is bound to discharge this as far as he has assets. In the case of a parish apprentice (32 Geo. III. c. 57, s. 1), this obligation only lasts for three months, where the apprentice-fee is not more than 5*l.*, and the indenture is then at an end, unless upon application by the widow or executor, &c. of the master or two justices, the apprentice is ordered to serve such applicant for the remainder of the term. By the custom of London, if the master of an apprentice die, the service must be continued with the widow, if she continue to carry on the trade. In other cases, it is incumbent on the executor to put the apprentice to another master of the same trade. By the Bankrupt's Act, 6 Geo. IV. c. 16, s. 49, it is enacted, that the issuing of a commission against a master shall be a complete discharge of an indenture of apprenticeship; and where an apprentice-fee has been paid to the bankrupt, the commissioners are authorized to order any sum to be paid out of the estate for the use of the apprentice which they may think reasonable.

A master may by law moderately chastise his apprentice for misbehaviour. He cannot, of his own accord, discharge him. But if he have any complaint against him, or the apprentice against his master, on application of either party to the sessions, by 5 Eliz. c. 4, or to two justices in the case of a parish apprentice, by 20 Geo. II. c. 19, and other acts, a power is given to punish or to discharge the apprentice, and in some cases to fine the master. If any apprentice, whose premium does not exceed 10*l.*, run away from his master, he may be compelled (6 Geo. III. c. 25) to serve beyond his term for the time he absented himself, or make suitable satisfaction, or be imprisoned for three months. If he enters another person's service, his master is entitled to his earnings, and he may bring an action against any one who has enticed him away.

In London, in case of misconduct by the master towards the apprentice, or by the apprentice towards the master, either party may summon the other before the chamberlain, who has power to adjudicate between them, and, upon the disobedience or refractory conduct of either party, may commit the offender to Bridewell.

The main objections to apprenticeship are, its interference with the property which every man has, or ought to have, in his own labour, and its encroachment not only on the liberty of the workman, but also of those who might be disposed to employ him, and who may safely be allowed to judge whether he is fit to be employed or not. To require in the more common mechanical trades the same length of apprenticeship as in the nicer and more difficult arts, is manifestly unnecessary and inexpedient; and it is obvious that

long apprenticeships have a tendency rather to repress than encourage a love of industry, as an apprentice is excluded from the greatest incentive to voluntary labour, namely, a participation in the fruits of his exertions or skill. Most of these objections apply to apprenticeship as a necessary rather than a voluntary contract, and are of course removed by the present state of the law. At the age at which apprentices are usually bound some subjection to restraint is desirable; and, whether by being bound as an apprentice, or by working as a journeyman, a workman is most likely to gain a complete knowledge of his trade, and to acquire habits of industry, may be left to the determination of those who are practically interested in the question.

APPROACHES, the general term given to the trenches excavated by the besieger, for the purpose of forming roads, by which he may advance from his camp to the foot of the breach made in the walls of a fortress without being exposed to the view of the defenders. These approaches sometimes consist of covering masses only, formed either with earth in bags, with fascines, stuffed gabions, wool-packs, or bales of cotton.

APPROVER. By our antient law, where a person who had been arrested, imprisoned, and indicted for treason or felony, confessed the crime charged in the indictment, and was admitted by the court to reveal on oath the accomplices of his guilt, he was called an *approver*.

The judge or court might in their discretion give judgment and award execution upon the party confessing, or admit him to be an approver. In the latter case a coroner was directed to receive and record the particulars of the approver's disclosure, which was called an *appeal*, and process was thereupon issued to apprehend and try the *appellees*, viz. the persons whom the approver had impeached as the partners of his crime.

As the approver, in revealing his accomplices, rendered himself liable to the punishment due to the crime which he had confessed, and was only respited at the discretion of the court, it was conceived that an accusation, made under such circumstances, was entitled to peculiar credit, and the accomplices were therefore put upon their trial without the intervention of a grand jury.

Here, however, as in other appeals [see **APPEAL**] the parties accused by the approver were allowed to choose the mode of trial, and the approver might be compelled to fight each of his accomplices in succession. But, unlike an appeal by an innocent person, the prosecution at the suit of an approver might be defeated and discharged by a pardon granted by the king either to the approver or to the appellee.

If the approver failed to make good his appeal, judgment of death was given against him. If he succeeded in convicting the appellee, then he was entitled to a small daily allowance from the time of being admitted approver, and to a pardon from the king.

The appeal by approvers had become obsolete before the abolition of it by parliament; and the present practice is to prefer a bill of indictment against all parties implicated in the charge, and to permit the criminal who confesses his guilt to give evidence against his companions before the grand jury. If upon the trial the demeanour and testimony of the accomplice is satisfactory to the court, he is recommended to the mercy of the crown. (See 2 Hawk. *Crown Law*, ch. 24.)

APPROXIMATION, from the Latin, signifies a *drawing near to*. In mathematics, results are said to be found by approximation, when the process employed gives nearly, but not exactly, the result required.

Strictly speaking, the observed phenomena in every branch of experimental philosophy are approximations, more or less near, to the truth. Thus the distance of the sun, or the diameter of a planet, are only known approximately: but general custom does not sanction the application of the term to any 'drawing near' in which the imperfection arises from error of the senses, or of instruments. It is only when the defects of mathematical analysis oblige us to be content with a formula which gives results only nearly true, that the latter are said to be approximate. To this part of the subject, then, we confine ourselves.

It may be stated as a general fact, that there are very few mathematical processes, except those of pure geometry, which give absolutely correct determinations, in which the answer obtained is neither more nor less than is necessary to satisfy the conditions of the question. But the fault is not in the

processes themselves, but in the problems which it is necessary to submit to them, and in the nature of arithmetical, as distinguished from geometrical, magnitude. It is worth while, briefly, to elucidate this point. In geometry, the mind conceives one line or angle to differ from another by some magnitude of the same kind which can be assigned, and a magnitude is rather imagined to be given, than actually given. If we attempt to *construct* the line or angle of geometry, we must have recourse to approximation, and that of the roughest character, since the errors are as great as those of the senses. It is only by laying down the postulate that any line or angle can be assigned independently of all mechanical methods, that geometry becomes a science of absolute exactness. In arithmetic, on the contrary, the very first notion of numbers throws a theoretical difficulty in the way. We can imagine a line to grow or increase *continuously*: that is, in such a way that it shall not increase from one to two feet, without previously assuming every possible length which lies between one and two feet. This idea is forced upon us whenever we see points moving to or from each other. But is it therefore true, that every possible length which is greater than one foot and less than two, can be expressed by one foot and some determinate numerical fraction of a foot? This question reduces itself to the following. Let A D be

greater than A B (one foot), and less than A C (two feet); if B C be successively divided into two equal parts, three equal parts, four equal parts, and so on, *ad infinitum*, does it follow that some one or other of the subdivisions must of necessity fall upon the point D, previously taken at hazard? If we appealed to the evidence of the senses, we should certainly answer in the affirmative, for, though the finest compasses were used, we should soon find some point of subdivision so near to D, as not to be distinguishable from it by the severest test our senses could apply. But our mechanical points are minute solids, while the mathematical point has neither length, breadth, nor thickness. Conceive the latter, and the affirmative answer does not appear self-evident; for though the continuation of the points of subdivision is unlimited, the number of points which can be taken in the line is also unlimited. But we can demonstrably answer the question in the negative (see the *Society's Treatise on the Study of Mathematics*, p. 81): as an instance, let B D be equal to the side of that square of which B C is the diagonal, or let B C be the circumference of that circle of which B D is the diameter. In neither case can one of the subdivisions of B C ever fall on D.

Here then is a fruitful source of the necessity of having recourse to approximation, since we cannot be sure that any required relation between concrete magnitudes is absolutely expressible in numbers. In fact, we may state the following as a result of experience, though, not so far as we know, capable of demonstration:—numbers being taken at hazard, and submitted to any process which requires the solution of an equation higher than the first degree, the odds are greater than can be assigned against obtaining an absolute result without approximation. In a common table of logarithms, fixing at hazard upon any number, the odds are nearly seventeen thousand to one against choosing a number of which the logarithm can be exactly given.

This would appear to throw an air of uncertainty over almost all the conclusions of pure mathematics, and justly so, if it were not for the following truth, which, except so far as the labour of approximation is concerned, renders it practically immaterial whether a result is obtained exactly, or by approximation. Any equation whatsoever, which expresses the conditions of a possible problem, if not capable of exact solution, may yet be so far satisfied that a number or fraction can be found, which, on being tried in the given equation, shall produce an error smaller than any we may think it necessary to name at the outset. For instance, the ratio which the circumference of a circle bears to its diameter does not admit of an exact and absolute determination. If any two numbers be named, their ratio is either too great or too small. But supposing it asked to determine the circumference of a circle from its diameter so nearly, that the error shall not be so much as a foot for every hundred miles of diameter, or in that proportion. It can be shown to be more than sufficient for this purpose to multiply the diameter

by 355 and divide by 113; which, if the diameter were 100 miles, would give 314 miles, 280 yards, and one foot: this, though too small, is within the conditions of the question, not being too small by one foot. Again, though it is impossible exactly to solve the equation $x^2 = 7$ or $x^2 - 7 = 0$, that is, to find a fraction which, multiplied by itself, shall make 7, yet naming any fraction, however small, at pleasure, for example, one millionth or .000001, it is possible so to determine x , that $x^2 - 7$, though not absolutely *nothing*, shall be less than the proposed fraction, one-millionth.

It is not our purpose here to enter upon methods of approximation: no space which we could devote to the subject would suffice to explain any of them with sufficient detail to render them of practical use. We shall therefore content ourselves with giving a general view of one of the great methods, we might say, *the great method*, usually employed, and shall thereby, in succeeding articles, show the young mathematician that various methods, upon which he must have come in the course of his reading, contain a common principle, though disguised under the various forms of calculation which it is necessary to employ in different cases. We must now suppose the reader acquainted with the elements of the differential calculus.

When a number is given, and certain processes are also known, so that they can be performed either exactly or approximately, we are in possession of the solution of the following question—given the number, and the process, to find the result of the process. Hence immediately there results reason for inquiry into the inverse question—knowing the process, and the result of it, what was the number on which the process was employed? The way of finding this number is called the inverse process, and, if of sufficiently frequent occurrence, a name is given to it, and the rule for finding it is put into words, and arranged in its most systematic form. Thus the process of *squaring* or multiplying a number by itself, is known when multiplication is known, and the question is easily answered, what is the square of $2\frac{1}{2}$ or any other number, or what *results* from the process of *squaring* employed upon the number $2\frac{1}{2}$? From this arise such questions as the following:—The *result* of *squaring* is found to be 50; what was the *number employed*? This can only be answered approximately; that is, no number *exactly* can give *exactly* 50, though one can be found, the square of which is as near 50 as we please. This operation occurs sufficiently often to receive the name of the extraction of the square root, and the rule for approximating to it is well known. We can now carry the generalization a step farther, for the result of the last is to put a new process into our hands which we may consider as direct, since the means of performing it in all cases, approximately at least, have been found. We may now ask, what is the result of the process denoted by

$$x^2 + \sqrt{x^2 - 1},$$

any number being substituted instead of x : but the inverse question—namely, suppose the above process to have been performed, and the result to be 20; what number was employed?—presents itself and requires new investigation. Neither the direct nor inverse process in this case has received a name; and it is evident that, name as many as we may, each addition will give new processes, require new inverse processes, and so on *ad infinitum*.

Previous to entering upon the process of approximation it is necessary to inquire into the effect which a small change in the number employed would produce upon the result. We say a *small* change, because changes of any magnitude require formulæ of great intricacy, compared with small changes. The consideration of the effect of such change is, among other things, the object of the DIFFERENTIAL CALCULUS; into which we can here enter no further than to state, that in connexion with every process it discovers others, which we shall here call by the names of the *first* derived process, the *second* derived process, &c.; the first of which are indispensable, the first for obtaining the approximation, the second for ascertaining the degree of accuracy to which the approximation has been carried. These *derived* processes (as we here call them) are the first and second differential coefficients. [See DIFFERENTIAL CALCULUS.]

Let $f x$ represent the required process or FUNCTION. Let $f' x$ and $f'' x$ represent its first and second derived functions. We suppose this notation known to the reader; but any one who has studied algebra may be prepared to follow us by

reading the first thirteen pages of the Society's treatise, entitled *Elementary Illustrations of the Differential and Integral Calculus*. If the operations which fx indicates to have been performed upon x , be successively performed on a and $a + h$, giving fa and $f(a + h)$, it may be proved that

$$f(a + h) = fa + hf'a + \frac{h^2}{2} f''(a + \theta h) \quad (A),$$

where θ is a fraction less than unity, or θh is less than h . This rule only admits of exception where fx is such that either $f''x$ becomes very large, or $f'x$ very small, for some value of x lying between a and $a + h$; and since in approximations h is a very small quantity, this will rarely happen, and when it does happen, the results of an attempt to approximate will soon point it out. Let us now suppose that we wish to find x in such a way that $fx = 0$. Every case may be easily reduced to this: for example, to solve $x^3 = 7$ is to find or approximate to a value of x , which makes $x^3 - 7 = 0$. The first step is to find by trial some value of x which will very nearly satisfy the proposed condition, that is to find a , so that fa shall be small. No general rule can be given for this part of the process, which is, however, easily done in most cases. To carry an example with us, let us suppose it required to solve the equation:

$$x^3 - 2x = 5$$

or to make

$$x^3 - 2x - 5 = 0.$$

Here fx is $x^3 - 2x - 5$, and, by the rules of the differential calculus, $f'x$ is $3x^2 - 2$, and $f''x$ is $6x$. We soon find that there is a root between 2 and 2.1, for if $x = 2$, then $x^3 - 2x$ is 4, and if $x = 2.1$, it is 5.061; the first less than 5, the latter greater, but not much. We therefore take 2.1 as the approximate value of x found by trial.

Returning now to equation (A), let us suppose a the approximate value increased by h , in such a way that $a + h$ shall be the real value of x required, or $f(a + h) = 0$. This gives

$$h = - \frac{fa}{f'a + \frac{1}{2} h f''(a + \theta h)} \quad (B),$$

in which h is not, strictly speaking, determined, because it occurs on the second as well as the first side. But h is small, because a is nearly the value required, and therefore we may approximate to the value of h from (B) by rejecting the small term

$$\frac{1}{2} h f''(a + \theta h)$$

from the denominator of the fraction, which gives

$$h = - \frac{fa}{f'a}$$

for an approximate value of h : so that the new value of x obtained from the step just made is

$$a - \frac{fa}{f'a}$$

With this new value of x we may recommence the process, and find a new correction; and so on.

Resuming the example, we find putting $a = 2.1$,

$$fa = a^3 - 2a - 5 = .061,$$

$$f'a = 3a^2 - 2 = 11.23,$$

$$h = - \frac{.061}{11.23} = -.0054 \text{ nearly,}$$

$$x = a + h = 2.0946 \text{ nearly.}$$

Trying this value in $x^3 - 2x - 5$, we find it .005, nearly; less than the tenth part of its preceding value. With 2.0946 for a , the process must be now repeated.

The degree of approximation thus obtained may be estimated as follows, though we can only very briefly explain it to those who have no more practice in the differential calculus than we have hitherto supposed. Resuming the correct equation (B), we see that, if we call fa , as obtained, a small quantity of the first order, $(fa)^2$ of the second, and so on, then h will be of the same order as fa , unless $f'a$ be also of that order, which is one of the excepted cases. Hence, in rejecting θh , we reject only quantities of the first order from the term $f''(a + \theta h)$, or of the second from $\frac{1}{2} h f''(a + \theta h)$, or of the third order from the whole fraction, since fa is itself of the first order. This will appear from the develop-

ment of the second side of (B) by common division. Thus rejecting θh , and developing

$$- \frac{fa}{f'a + \frac{1}{2} h f''a}$$

as far as terms of the second order, we have

$$h = - \frac{fa}{f'a} \left(1 - \frac{f''a}{f'a} \frac{h}{2} + \&c. \right),$$

in which, if on the second side we write $-\frac{fa}{f'a}$ for h , which rejects terms of the second order only, we still reject terms of the third order only in the value of h . Hence

$$h = - \frac{fa}{f'a} \left(1 - \frac{1}{2} \frac{f''a}{(f'a)^2} fa \right) \text{ nearly}$$

and its ratio to its preceding value $-\frac{fa}{f'a}$ is

$$1 - \frac{1}{2} \frac{f''a}{(f'a)^2} fa$$

whence $-\frac{1}{2} \frac{f''a}{(f'a)^2} fa$ represents roughly the greatest part

of itself, by which the correction $\frac{fa}{f'a}$ may be erroneous the sign indicating whether it is too small or too great. In the preceding example, where $a = 2.1$, and where

$$fa = a^3 - 2a - 5 = .061,$$

$$f'a = 3a^2 - 2 = 11.23,$$

$$f''a = 6a = 12.6,$$

the preceding fraction is roughly $-\frac{1}{32}$, so that the correction .0055 may possibly be one thirty-second of itself too great, or about .0002 too great.

This method does not appear to be of much use for the second approximation; but becomes more powerful at every succeeding step. Whatever number of correct decimal places is obtained at the end of any one of the successive approximations, it is, roughly speaking, doubled by the next; since the second term of the preceding development of h , being

$$\frac{1}{2} \frac{f''a}{(f'a)^2} (fa)^2,$$

is of the same order as the square of h , or of the same order as

$$\left(\frac{fa}{f'a} \right)^2$$

In treating the various articles, DIVISION, SQUARE ROOT, &c., EQUATION, we shall show that principles analogous to the preceding have been adopted in the rules for approximating.

Various methods of approximation are found in the Hindoo Algebra; but, as far as we can find, Vieta is the first who generalized the main principle so far as to connect the approximate solution of equations with the particular cases of division and the square root, which were known before. Hutton, in his *History of Algebra*, (see his Tracts,) attributes this extension to Stevinus, but on searching the works of the latter, we cannot find anything which, in our opinion, justifies the assertion. The connexion of the arithmetical rules, in which successive figures are successively found, with the preceding, will not at once be obvious; but our limits oblige us to refer to EQUATION on this point. Newton first applied the theory of derived functions directly to algebraical equations; and the method was further extended by Lagrange.

APRICOT is a well-known fruit, cultivated commonly in this and other European countries. The old English name is *a-precoke*, of which apricot is probably a corruption. Like many other domesticated plants, the native country of the apricot tree is unknown: from the name it bore among the Romans, *Armeniaca*, it would appear to have been a native of Armenia, to which country it is in fact assigned by both Pliny and Columella. It has, however, been represented by M. Regnier, a French writer, that it is rather a native of the Oases of the Desert of Egypt, an opinion that seems to have been formed upon these circumstances. firstly, that the modern Greeks call the apricot *Perihokka*, which is nearly the same as the Arabic name *Berkhach*; secondly, that vast quantities of this fruit are actually dried in the Oases and brought to Egypt, where they are

called *Mish-mish*; and thirdly, that the early period of the year when its blossoms unfold, is indicative of a southern rather than of a northern climate. As to the latter observation, it seems to be completely at variance with facts, for the earliest of trees in leafing are the Tartarian honeysuckle and the sanguine hawthorn, which are both found wild in the coldest parts of Asia. It is, perhaps, impossible to demonstrate, from any published evidence, that it is really found wild in Armenia. The following note with which we have been favoured by Mr. Royle, the distinguished author of *Illustrations of the Botany of the Himalaya Mountains and of Cashmere*, may throw some light on the matter:—"The apricot is frequently found in the hills between the Ganges and the Jumna, apparently wild, as well as the walnut, peach, and pomegranate. The two latter appear to be perfectly wild, at least they are found away from villages and covering the sides of hills; but the latter having been formerly much more populous than they now are, many sites of villages and cultivation are concealed and overgrown with vegetation, so that it is difficult to recognise them. The apricot is so generally planted round villages, that there are few without them, the fruit being eaten fresh and also dried, while a very fine oil is expressed from the kernel. My collectors in visiting Cashmere said the fruit trees there formed a perfect jungle. The dried apricot is brought in considerable quantities from Cashmere into India, and called *Khoot-banee*. I am myself rather inclined to think the Caubul mountains the source of many of our fruit trees, and among others of the apricot."

As a domestic fruit tree in the climate of England, the apricot is a plant of less importance than many others; the early season at which it blossoms causes it to be peculiarly subject to the effect of spring-frosts, so that a crop of its fruit is very precarious. It is, however, very much cultivated; and it is therefore necessary that we should say something of its varieties and of the mode of managing it.

Apricots in this country are produced either upon open standard trees, or upon walls with a westerly aspect; an eastern exposure is extremely unfavourable to them, at least on the east side of the island. The fruit produced upon walls is the finest, but that from standards is by far the best flavoured.

Of the kinds that are cultivated upon walls there are only three that are much worth having, namely, the orange for preserving, and the Moorpark and Turkey for the table; several others are to be met with in nurserymen's catalogues, but they are of little importance.

There are only two sorts that deserve notice as open standards, namely, the Breda and the Brussels; the former a small yellowish-brown unspotted kind, the latter a larger compressed variety with rich sanguine blotches on its sunned side. Both these, and particularly the latter, are annually loaded with fruit in almost any situation as far north as Ipswich, but we have not remarked them beyond that limit. For preserving, the purpose to which the apricot is best suited, the fruit thus obtained is far superior to any other, as it combines a moderate degree of acidity with a rich saccharine quality. In the south of Europe there is a sort extensively cultivated for preserving, which is hardly known in Great Britain; the French call it *Alberge*, which is probably a corruption of *Al Berkhach*, the Arabic name of the *Mish-mish* variety, from which it is probable that the *alberge* is not materially different: this sort is too tender for England.

The rules for training the apricot are essentially the same as those for the *PRACH*. The practice is to arrange the shoots upon the wall in what is called the fan fashion, which is by making them radiate at nearly equal distances from a common centre, which is the point where the scion and stock are united. In order to effect this, the shoots are annually shortened back to the length of from six to eighteen inches, according to their strength, and nailed to the wall at from five to six inches distance from each other. Besides this, the first shoots that are protruded in the spring should be examined in May, and all that are superfluous amputated: the stoutest entirely, the weakest only reduced to the length of an inch or two, when they will often become flowering spurs.

No stocks for apricots should ever be employed except the mussel plum and the common plum for clayey, or loamy, or sandy soil; and the seedling apricot itself for soils that are warm and calcareous. All others, and especially what is called the Brompton stock, are so unsuitable to the constitution of the apricot, as to be short-lived and worthless.

Besides the true apricot, there are occasionally seen in the gardens sorts called black or purple. These are distinct species, one being *Prunus dasycarpa*, and the other *Prunus Sibirica*, neither of which is at all worth the trouble of cultivating: they are small, dark purple, acid fruits, and merely objects of curiosity.

APRIES, an Egyptian king, the son of Psammis, (Herod. ii. 161,) otherwise called Psammuthis; he was the eighth king of the twenty-sixth dynasty, (Eusebius,) or the seventh according to Africanus. His name is also written Quaphres by the Greeks, and he appears in the Hebrew history under the name of Pharaoh Hophra (Jeremiah xlv. 30). Apries succeeded his father B.C. 593, and reigned twenty-five years. Early in his reign (B.C. 586) Jerusalem was plundered by Nebuchadnezzar; after which a great number of the people of Judah took refuge in Egypt, under the conduct of Johanan, who carried the prophet Jeremiah with him to Tahpanhes, (Daphnæ,) then the residence of the Egyptian king. Apries, as we learn from Herodotus, made an expedition against Cyprus, and had a naval engagement with the Tyrians. Near the close of his reign he sent an army against the Greeks of Cyrene, which was defeated with great loss. This caused a revolt among the Egyptians, which ended in the dethronement and execution of Apries about B.C. 569, or 568. [See AMASIS.] He was buried in the tombs near the great temple of Athenæa at Sais, where his ancestors of the Saite dynasty were interred (Herod. ii. 169).

APRIL, the fourth month of the year, consists of thirty days, which was the number said to be assigned to it by Romulus. Numa Pompilius deprived it of one day, which Julius Cæsar restored, and which it has ever since retained. In the original Alban or Latin Calendar, April held the first station, and then consisted of thirty-six days. (See FITS, *Lexicon Antiq. Roman.* tom. i. p. 129; Brady's *Clariss. Calendaria*, p. 67.) Its name is usually considered to have been derived from *aperire*, to open; either from the opening of the buds, or of the bosom of the earth in producing vegetation. The Anglo-Saxons called it *Ooster* or *Easter-Monath*. In this month the sun travels through parts of the signs of Aries and Taurus, that is to say, of those parts of the *ecliptic* which astronomers designate by those names. The real motion of the sun among the constellations is through parts of Pisces and Aries. [See PASCHESSE, ZODIAC.]

APRIL CEREMONIES. The custom of making fools on the first of April is a practice well known in England, France, Sweden, and probably in other countries of Europe; and it is believed to be connected with an immemorial custom among the Hindoos held near the same period in India, toward the end of March, called the *Huli Festival*, when mirth and festivity reign among the Hindoos of every class, and people are sent upon errands and expeditions which end in disappointment, and raise a laugh at the expense of the person sent. (See *Asiat. Res.* vol. ii. p. 334.)

The origin of this April custom seems unknown even where, though Bellinghen, in his *Etymology of French Proverbs*, considers that it may possibly have an allusion to the mockery of our Saviour, about this time, by the Jews; a conjecture which is in some degree paralleled, if not corroborated, by the custom of lifting in the Easter holidays undoubtedly intended to represent our Saviour's resurrection.

In England, the first of April is usually termed 'All Fools' Day,' and the person imposed upon, an April Fool. In France this person is called a 'Poisson d'Avril,' i.e. a mackerel, or silly fish. In Scotland, 'an April Gowk' Maurice, *Indian Antiq.* vol. vi. p. 71, speaks of the Huli Festival as the celebration of the period of the vernal equinox.

A' PRIOR'I and **A' POSTERIO'R'I**; two logical terms signifying, literally, "from a thing before," and "from a thing after." They are applied to distinguish between two different methods of reasoning, the first, *a priori*, in which the conclusion is drawn from previous arguments, which render it unnecessary to examine the particulars of the case in point; the second, *a posteriori*, in which the thing to be proved is examined, and made the source out of which the reasoning is drawn. It must be noticed, however, that these are rather terms of common conversation and writing, than of logic, properly so called; so that they are seldom noticed by writers on that science. The use of them is a general very vague, and the consequence of any attempt to define them very strictly would be either to make out a priori reasoning to be altogether impossible, or to throw improper

ble difficulties in the way of finding where it ends and he other begins. In common language, we reason *a priori* when we infer the existence of a God from the general difficulties in the supposition of the existence of what we then call the creation, on any other hypothesis; but we reason *a posteriori* when we infer the same from marks of intelligent contrivance in this particular creation with which we are acquainted.

The term *a priori* is, however, frequently used in a sense which implies "previous to any special examination." As when a sentence begins with "*a priori* we should think, &c. &c." which in most cases will be found to mean nothing more than an expression of the leaning which the speaker found his mind inclined to, when he had only heard his proposition, and before he had investigated it.

All *a priori* reasoning is dubious, to say the least: in but very few cases, if any, are we able to say we know sufficient beforehand to render this sort of argument safe. The whole mass of school learning, the greater part of which was overturned by the inductive philosophy, was based upon *a priori* argument. But though the method is of little effect towards the establishment of truth, it is highly effective in its discovery; indeed, by the very nature of its definition, it must be the guide which points out the probable direction in which the thing sought may be found. Columbus went to look for the continent of America, in consequence of certain convictions of his own, derived from *a priori* reasoning. So far he was right: but had he contented himself with writing a quarto volume to prove the existence of the new continent, by reasons which were only strong enough to make it right to look for more, some less imaginative *a posteriori* reasoner would have been the real discoverer.

APSIDES, a Greek term, used to signify those points of a planet's orbit in which it is moving at right angles to the line drawn to the primary. These points are also those of greatest and least distance from the primary. [See APOGEE and PERIGEE for the moon and sun; APHELION and PERHELION for the earth or a planet.]

APT, a town in France, the capital of an arrondissement in the department of Vaucluse, about nine leagues (twenty-two miles) E. of Avignon according to Reichard's *Itinerary*. It is considerably more (above thirty miles) by measurement in the best maps*. It is a very ancient town, having existed in the days of the Romans, who planted a colony here and gave it the name of Apta Julia. There are some remains of antiquity: the present walls are said to be of Roman origin, but it does not appear to have had an amphitheatre.

Apt is on the south bank of the Caillon or Calavon, (a feeder of the Durance,) and there is a fine bridge of one arch over this stream. It possesses an old cathedral, (for it was a bishopric before the revolution,) in the subterranean chapels of which are several ancient remains. The chief trade of the town is in dried fruits, especially plums. The inhabitants manufacture wax candles, which are in considerable repute, woollen stuffs, hats, and leather; they also spin cotton and silk. The neighbourhood furnishes ochre of excellent quality, and earth for pottery. The population, according to Malte Brun, is 5433. 43° 53' N. lat., 5° 25' E. long.

The arrondissement of Apt contains 500 square miles, and above 52,000 inhabitants.

APTERAL, a term used in architecture with reference more particularly to a mode of arrangement peculiar to the temples of the ancient Greeks and Romans. It is formed from a Greek compound term, signifying 'not having a wing,' or 'without wings;' and in this sense it is applied to a temple having prostyles, or porticoes of columns projecting from its fronts or ends, but of which the columns do not extend laterally, and run along the flanks from one end to the other, so as to make it *peripteral*. [See PERIPTERAL, or PERIPTEROS.] The Panhellenium of Ægina, a plan of which will be found with the article ÆGINA, vol. i. p. 141, is *peripteral*; but if the outer columns of the fronts, with the ranges along the flanks, were removed, the temple would then be *apteral*, as it would be also *amphiprostyle*. The parallelogrammic temples of the Romans were for the most part simply *apteral* prostyles, and their arrangement has been much more followed in modern works than that of the Greek temples, which are, with few exceptions, *peripteral*. Our modern churches which have porticoes,

though some of them are professedly on the Greek model, are, nevertheless, generally, illustrations of the *apteral* arrangement, and of these that of St. Pancras in London may be best referred to as an example.

APULEIUS (LUCIUS), a Platonic philosopher. He lived in the second century, and was born at Madaurus in Africa. He studied first at Carthage, then at Athens, and afterwards at Rome, where he acquired the Latin language without the help of a master. He was a man of a curious and inquisitive disposition, especially on religious subjects; and to gratify this curiosity, he travelled extensively, and sought to obtain initiation in the various *mysteries*, as they were called, by which the peculiar tenets of many religious and philosophical sects were veiled. Having spent nearly his whole fortune on these journeys, he returned to Rome, and was admitted as a priest into the service of Osiris. He practised at Rome for some time as an advocate, and then returned to seek his fortune in his native country, Africa. Here he met with distinguished success: but he set himself more at his ease by a prudent marriage, than even by his professional gains. A widow, by name Pudentilla, neither young nor handsome, had wealth, and wanted a husband. She took a fancy to him; but the marriage involved him in a vexatious lawsuit. The lady's relations set up a plea that he had attacked her heart and money with the weapons of sorcery; and they accused him of being a magician before Claudius Maximus, proconsul of Africa. Apuleius made a spirited defence; and his *Apology*, or *Oratio de Magia*, still extant, is a curious and valuable specimen of the literature of the age. The *Golden Ass*, otherwise called the *Metamorphosis*, the best-known work of Apuleius, is a running satire on the absurdities of magic, the crimes of the priesthood, the amorous intrigues of debauchees, and the systematic outrages of thieves and robbers. The dupe to the research after the philosopher's stone affected to find authority for their fantastic science laid down, and their hopes of success encouraged, in that work. The episodes are the most valuable portions of the piece; especially that of Psyche. Many persons have taken all that is related in it for true history: St. Augustin himself had his doubts on this head; and did not feel satisfied that Apuleius had designed this book only as a romance. Some of the ancients have spoken contemptuously of this performance. Macrobius makes over the *Golden Ass* and all such romances to the perusal of nurses and gossips. But whatever may have been his defects, Apuleius was an unwearied student, and has touched many passages with a masterly hand. He wrote numerous works in verse and prose, the greater part of which are lost. They are enumerated in the Dissertation de *Vita et Scriptis Apuleii*, prefixed by Wower to his edition, and adopted into the Delphin. It is probable that Apuleius wrote some books in Greek as well as in Latin. He also translated Plato's *Phædon*, and the *Arithmetic* of Nicomachus. He wrote treatises *De Republica*, *De Numeris*, and *De Musica*. Fragments from his *Table Questions*, his *Letters to Cerealia*, his *Proverbs*, his *Hermagoras*, and his *Ludicra*, are scattered up and down in quotation. Besides his *Golden Ass* and his *Apology*, his work *De Dogmate Platonis*, containing three treatises, 1. *De Philosophia Naturali*, 2. *De Philosophia Morali*, 3. *De Philosophia Rationali*; his books, *De Deo Socratis*, *De Mundo*, which is a translation from Aristotle, and his *Florida*, have survived. He took great pleasure in declaiming, and was heard with universal applause. The effect produced by his pleading at Cæsa was so great, that the audience burst into a unanimous demand for the honours of citizenship to be conferred on him. The people of Carthage were so delighted with his eloquence, that they perpetuated the remembrance of it by erecting his statue. Several other cities paid him the same compliment. Some of his works have been printed separately, with notes by learned critics. The editions of his works are very numerous: that in most general use is the Delphin, in two volumes, quarto.

The *Golden Ass* has been very frequently translated. The *Biographie Universelle* enumerates six French translations and four Italian, besides translations into Spanish, German, Flemish, and English. W. Adlington's English translation, first printed in 1566, was reprinted in 1571, 1582, 1596, 1639, and probably later also. The latest and best English translation is by Thos. Taylor, London, 1822, one vol. 8vo. This volume contains also the treatise on the God of Socrates, and other treatises; with a life of Apuleius prefixed.

APULIA, the name of one of the divisions of southern

* Nine leagues and three-quarters of twenty-five to the degree (equal to twenty-seven English miles). (Dict. Geog. de la France.)

Italy in the time of the Romans. Its limits were on the east and north the Adriatic Sea, on the north-west the river Frento, or perhaps the Tifernus, which divided it from the Frentani, Samnium on the west, Lucania on the south, and Messapia on the south-east. It does not appear that the Romans ever considered the Messapian peninsula, now called Terra d'Otranto, as part of Apulia. In remoter ages, the whole of this part of Italy was known to the Greeks by the name of Iapygia (see Herod. iv. 99.), and was inhabited by the Daunii, the Peucetii or Pædiculi, the Messapians, and the Salentini, who were all said to be descendants of Greek or Pelasgic colonies. The original Apulians were probably a tribe of the Opici or Osci. (Niebuhr's *Hist. of Rome*, vol. i.)

According to Strabo (vi. p. 283), the Peucetii extended along the coast from Brundisium to Barium, a distance of about 700 stadia; north of the Peucetii were the Daunii, and then the Apuli, extending to the southern confines of the Frentani. Strabo adds, that in his time the names of Peucetii and Daunii were not in use among the natives, and that it was difficult to fix the antient limits of these people. Roman Apulia, in its extended sense, included the countries of the Apuli, the Daunii, and the Peucetii. The islands of Diomedes, now called Tremiti, belonged also to it. The principal towns of Apulia were Teanum, Luceria, Asculum, Argrippa or Arpi, Sipontum, Salapia, Barium, Egnatia, Canusium, and Venusia, the birth-place of Horace. This country suffered greatly during the second Punic war, when some of its towns sided with Hannibal and others with Rome. The whole finally became subject to the Roman sway. After the fall of the western empire the possession of Apulia was long disputed between the Goths, the Byzantine emperors, the Longobards, and the Saracens. The Normans conquered Apulia in the eleventh century, and the Norman kings of Sicily styled themselves dukes of Apulia and princes of Capua. These two names included the whole of their continental dominions. When afterwards the monarchy was divided into two kingdoms, namely, Sicily *ultra pharum*, and Sicily *citra pharum*, the latter vulgarly called the kingdom of Naples, the name of Apulia was definitively limited to one of the four divisions of the continental kingdom, consisting of the Apulia of the Romans and the Messapian peninsula. [See PUGLIA.]

APURE RIVER. [See ORINOCO.]

APURIMAC, a river in South America, which carries off all the waters that descend from the eastern declivity of the Cordilleras, between the 11th and 16th degrees of south lat. Its source is in the high range which extends to the north of *Arequipa*, near the 16th degree of lat., under the parallel of the northern part of the lake of *Titicaca*, to the north-west of that lake, and nearly under the meridian of 72°. At first it runs to the north, but by degrees declines to the north-east, descending in that direction in a transverse valley of the range to the meridian of 71°, where it enters into a longitudinal valley, and suddenly changes its course to the north-west, in which direction it traverses 3° of lat., from the 15th to the 12th. In this space its waters are increased by two tributaries, the *Calcamayo* and the *Villcamayo*. The former joins it from the west, having gathered, in its course of about 150 miles, the waters of many small rivers, which descend from the western range of the Cordilleras in transverse valleys. The *Villcamayo* runs to the east of the *Apwirmai*, in a longitudinal valley, nearly parallel to it, from 15° to 12°; and is separated from the Apurimac by a high range of mountains. This stream runs upwards of 220 miles. Near 12° lat., the Apurimac is joined by the *Jauja* or *Xauxa*, the largest and most important of its tributaries, which rises between the 10th and 11th degrees of south lat., on the southern declivity of that chain, from which, on the north, the *Tunguragua* and *Huallagua* descend, and flows down in a longitudinal valley from north to south, till it nearly reaches the 13th degree of lat. Here it changes its course, running to the east; but it soon returns to the 12th degree by two bends of a semi-circular form, afterwards enters the plains, and joins the Apurimac under the 12th degree of south lat., after a course of about 300 miles.

After its junction with the *Xauxa*, the Apurimac runs through the plains in a north-eastern direction till it meets, in 10° 45' south lat., the *Pangoa*, which brings down all the waters descending from the eastern declivity of the mountain-range skirting the valley of the *Xauxa* on the east; and at this junction the name of the Apurimac is

changed into that of *Tumbo*, under which name it unites in 10° 31' with the *Parobeni*, and then takes the name of *Ucayali*. The whole course of the Apurimac may amount to nearly 500 miles.

It does not seem that either the Apurimac or any of its tributaries is adapted to the transport of commodities. Their rapid course in a stony bed between high rocks, and the shallowness of their waters, render them entirely unfit for navigation. On the contrary, they oppose considerable obstacles to travelling by land, on account of the height and steepness of their rocky banks, and in many places cannot be passed but by bridges made of cords or willow-twigs, after the fashion of wicker-work. Our authorities do not mention any fish in these rivers. The only advantage which is derived from them is the fertilizing of a few low tracts along their banks, by the spreading of their waters.

The valleys through which they flow, though of considerable length, are rather narrow. Near the sources they are mere crevices and ravines, but lower down they widen to an average breadth of two or three miles, which sometimes extends even to five. They are, however, not without cultivation. As the upper parts of the valleys lie between 6000 and 10,000 feet above the level of the sea, no tropical productions can be raised on them, but they produce the grains of Europe, especially wheat and barley, and our fruits, as also great quantity of papas. In the lower parts, especially towards the eastern plains, sugar, cacao, and cotton are raised in great quantity; the first is very abundant in the lower valley of the *Xauxa* and *Apurimac*; and here the gardens are chiefly planted with plantains and pine-apples. Indian corn and yams are cultivated for consumption. The mountains which skirt the valleys afford pasture for numerous herds of cattle.

The country drained by the Apurimac and its tributaries is the most important and most populous part of the republic of Peru; it comprehends the three departments of *Junin* or *Tarma*, *Ayacucho* or *Guamanga*, and *Cuzco*. Its superior cultivation is to be attributed not only to its being much more fertile than the countries along the Pacific, but also probably still more to the higher degree of civilization which its inhabitants had attained, under the reign of the Incas, before the discovery of America. It is still mostly inhabited and cultivated by the industrious descendants of the antient Peruvians, and contains many towns of importance, among which we may mention *Tarma*, *Guamanga*, and *Guamanga*, in the valley of the *Xauxa*, and *Cuzco*, the antient residence of the Peruvian monarchs, in the valley of the *Villcamayo*. (Alcedo's *Dictionary*, Humboldt's *Travels*.)

APUS, (Constellation,) from the Greek *ἄρος*, without feet, used to signify the bird of Paradise, the *avis Indica* of Linnæus, which was formerly believed to have no feet. It is a constellation introduced by BAYER, and lies too near the south pole to be visible in our hemisphere. It is surrounded by Octans, Pavo, Triangulum Australe, and Camelion. Its principal stars are designated as follows.

AQUAFORTIS. [See NITRIC ACID.]

AQUA-REGIA. [See CHLORINE.]

AQUARIUS, (Constellation,) the Water-bearer, one of the twelve zodiacal constellations. Its Greek name is *ὕδρηνος*, the Water-pourer. In the Indian zodiac it is simply a waterjug, the name of which, according to Bengt, is Coumbam, and the same in the Arabic; in the Egyptian, it is a male figure holding two urns, from which the water flows. The mythology of the Greeks refers the Water-bearer in different places to the fables of Deucalion, Ganymedes, Aristæus, and Cecrops. Its probable origin, however, whether we place the origin of the zodiac in India or Egypt, is the watery season of the year in which the sun was in this sign. Dupuis, who supports the latter opinion, thinks that Aquarius as well as Capricornus and Pisces refer to the months of the year during which the inundations

of the Nile took place: Legentil, who advocates the latter, imagines that they represent the rainy season which is absolutely necessary for the growth of the rice-crops.

The constellation Aquarius may be found in the heavens by producing southward a line drawn through the bright stars in the head of Andromeda and the wing of Pegasus. This line passes through the two brightest stars in Aquarius, α and β , situated in the two shoulders. The middle point between these two shoulder stars is on the meridian at 12, 10, 8, and 6 P.M. in the months of August, September, October, and November respectively, at an altitude of about thirty-five degrees.

A distinction must be drawn between the constellation and the sign of the Zodiac (see PRECESSION). The latter is the part of the ecliptic which begins at the horn of the constellation Capricornus and ends in the middle of the body of that of Aquarius, comprising the arc of longitude between 300° and 330° , and forming the sun's path between January 20th and February 20th.

The following are the designations of the various stars in Aquarius. Those in the column marked Flamsteed, &c., which have no parentheses or letter, are as marked by Flamsteed: those inclosed in () were added in Piazzi's catalogue: those in [] were added by Bradley; and the one marked Z by Baron Zach:

AQUATIC ANIMALS. The element in which animals habitually reside, or to which they occasionally resort

for the purpose of procuring food or seeking shelter, is so intimately connected with, and bears so obvious a relation to, not only their manners and economy, but likewise their outward forms and internal structure, that it is not surprising that those who first turned their attention to the study of zoology, and sought to introduce the principles of classification into the animal kingdom, should have been so forcibly struck with its importance, as to have made it the primary basis of their system. 'Animals,' says Aristotle (*Hist. b. i. c. 1*), 'may be distributed into different classes according to their manner of living, their actions, their character, and their parts. . . . Considered according to their manner of living, their actions, and their character, they are divided into terrestrial and aquatic. The aquatic are divided into two classes; the one, as is the case with many fishes, pass their whole life in the water, breathe that element, and find their food in it; nor do they ever leave it: the others obtain their food in the water, and even habitually reside in it, but they do not breathe it; they breathe air, and bring forth their young on dry land. Among these latter some are provided with feet and walk upon dry land, others have wings and fly, and others, like the water serpent, have no feet. . . . Aquatic animals inhabit seas, lakes, marshes, and rivers.' These principles of classification, in which the habits of animals take precedence of those modifications in their organic conformation which produce these very habits, have long since ceased to be adopted by scientific naturalists; notwithstanding which there is perhaps no inquiry which can engage the attention of the zoologist, more fruitful in extensive views and interesting results, than the consideration of the organic structure of animals in relation to the element in which nature has ordained them to live.

Let us consider, in the first place, those animals which reside entirely in the water, and seek their food and nurture their young in that element. All their organization, even to the most minute circumstance, is rigidly adapted to these purposes. The extremities by which progressive motion is performed in the acts of walking and flying, would be a serious impediment to the movements of animals residing in an element of the same specific gravity as their own bodies: these organs accordingly are either entirely wanting, or are reduced to mere rudiments, which serve indeed to keep the body steady and preserve its equilibrium, but are entirely useless in assisting its progression. Such are the *fins* of fishes, and the *flippers*, as they are called, of cetaceous animals. The real organ of progression in both cases is the body itself, which is prolonged and attenuated towards the tail, compressed on the sides, and provided with extremely powerful muscles, with which, by alternately striking the water on either side, the animal propels itself forward with a force and velocity unexampled in any other class of animated beings. It is upon this principle that we often see a boat urged forwards by means of a single oar in the stern. The great majority of these animals not only reside habitually in the water, and seek their food there, but likewise breathe that element, and are consequently furnished with an appropriate apparatus for extracting the vivifying principle from its general mass. These tribes may reside at any depth of the ocean and for any length of time; they are not under the necessity of coming frequently to the surface for the purpose of breathing, and their organization is modified accordingly. Instead of having the tail broad horizontally, it is broad in a vertical direction, which enables them to turn with astonishing rapidity, and is no impediment, but rather an assistant to their forward movements. But the case is different in the cetaceous tribes: these animals, though residing entirely in the water, breathe air by means of lungs like ordinary quadrupeds, and are consequently obliged to come continually to the surface. For this purpose they are provided with a powerful cartilaginous tail, *flattened horizontally*, by moving which upwards or downwards as the occasion requires, they descend to or ascend from the greatest depths of the ocean with almost incredible speed. Fishes, though capable of proceeding straight forwards, or of turning with great rapidity, are comparatively slow in changing their depths; and if they breathed air, they would frequently be suffocated before they could arrive at the surface, from the vertical position of the tail not being adapted to propel them in a vertical direction. But by a simple change, merely by the direction of the tail being altered from the vertical to the horizontal position, the object of nature is accomplished, and the air-breathing ceta-

oceanic animals are adapted to all the circumstances of an aquatic life. Another beautiful adaptation is observed in the position of the mammae, for the cetacea, like warm-blooded quadrupeds, suckle their young; these are situated upon the breast, and when the young animal requires to suck, the mother stands, as it were, upright in the water, with her head and shoulders elevated above the surface, supporting herself by means of her flippers or fore-paws. In this position she is enabled to supply her cub with the food which nature has provided, and which she could not have accomplished had the mammae been placed in any other position.

There is another extensive tribe of aquatic animals, which are provided with perfect articulated members, sometimes, indeed, supplied with fringes which convert them into a swimming apparatus, but always adapted to enable the animals to walk or crawl along the bottom. Such is the case with all the crustaceous tribes, the crabs, lobsters, prawns, &c.; and these animals, as is well known, can walk on dry land with the same ease as at the bottom of the ocean. When they swim, it is by means of the tail, which is always constructed for that special purpose, and is large and powerful.

Nor is the modification of structure less striking, when we examine those land animals which breathe air, and resort only occasionally to the water, than when we contemplate the tribes which make it their constant residence. Progressive motion on land and in water are so different, that the organs best adapted to the one sort are exactly the most unsuited for the other. In the one case, the body being much heavier than the surrounding medium, requires to be supported, or raised above the surface of the ground; and as progression is performed by the same organs which serve for supports, it follows that the speed of the animal's course will be proportioned to the length of its extremities. In the other case, the body being already supported by the element in which it floats, the length of the extremities would be only an impediment to the progress of the animal, and consequently they are, in such cases, either entirely wanting, or reduced to a rudimentary form, at least in perfectly aquatic animals. Those which resort indifferently either to the land or water, as they are intermediate in habits, so are they likewise intermediate in structure between these two extremes; and the degree in which their organization is modified, when compared with either of the two types, is exactly proportioned to the difference of their habits and economy. All mammals and reptiles, for instance, which seek their food in *fresh-water* rivers and lakes, partake more of terrestrial than of aquatic habits; the extent of water with which they are conversant is, in this case, very small when compared to the extent of land, and their organization differs but slightly from that of ordinary land animals; their extremities are perfectly developed, and of the ordinary form, the principal difference being that their toes are united by an expanded web or membrane, which gives the paw a broad oar-like form, and thus converts it into a convenient instrument of swimming, at the same time that it scarcely interferes with the most perfect freedom of walking and running on land. Of this nature are the extremities of all the vertebrated terrestrial animals which seek their food in fresh water, the otters, beavers, &c. among mammals; the whole order of Natatores, comprising the ducks, swans, pelicans, gulls, auks, puffins, &c. among the birds; and the crocodiles, alligators, fresh-water tortoises, and frogs, among the reptiles. All these animals are, properly speaking, web-footed, and their aquatic habits are less prominent and powerful than their terrestrial; their organs of motion in fact are but little different from those of common terrestrial animals. In those which frequent the *salt water*, on the contrary, the aquatic habits greatly predominate over the terrestrial: they live less on land than in water, and the structure of their extremities approximates more to that of purely aquatic than of terrestrial animals. Their legs are short and inserted, or, as it were, buried in the common integuments of the body, as far as the elbows and knees respectively, leaving apparent only a short fin-like paw, which is unadapted to terrestrial progression, exactly in proportion to its fitness as an organ of swimming. Their progress on land is consequently slow and difficult; they creep rather than walk, dragging the body along the ground, and leaving a broad mark behind them. Few species possess even this limited power of terrestrial motion; those which do, however, have

the structure of the extremities a little less approximated to the form of fins than the purely oceanic species. The seals and walruses, for instance, have the bones of the paws and feet similar to those of ordinary land quadrupeds, only much shorter and more flattened, and the hind-legs are thrown backwards in the same direction as the tail. Still they are enabled to use the extremities, in a certain degree, for walking or creeping on dry land; but the numerous tribes of cetaceous animals which can execute no kind of motion whatever out of the water, have the bones of the anterior extremities flattened and connected together like the stones of a mosaic pavement, whilst the posterior members are entirely wanting. The same is the case with the sea-tortoises, or, as they are more properly called, turtles, when compared with those which frequent fresh water ponds and rivers; the form of their extremities approximates more nearly to that of fins than of feet, and their aquatic habits consequently predominate over their terrestrial.

Thus it is that the peculiar form of the extremities not only indicates the degree in which an animal is aquatic, but even the nature of the element which it frequents. If it inhabit fresh-water ponds and rivers, its feet are simply webbed between the toes, but in other respects perfectly developed, and its terrestrial habits predominate over its aquatic; if, on the contrary, it inhabit the salt water, its feet are flattened into the form of fins, the hind legs are thrown backwards into the plane of the body, and its aquatic habits greatly predominate over the terrestrial. The first are, properly speaking, *web-footed*, the second *fin-footed*. [See AMPHIBIA.]

AQUATIC PLANTS, in horticulture, are those which are naturally found floating in deep water, and are carefully distinguished by the cultivator from mere marsh plants. The management of them when they are hardy is of the simplest kind, nothing being necessary beyond planting them in boxes with holes in the sides, and sinking them three or four feet below the surface of a pond, so that the boxes lie upon, or among the mud at the bottom.

But for those which demand the protection of the stove or green-house, some additional precautions appear requisite. If left to themselves in such situations, the uniformity of temperature is such as to deprive them in some measure of the repose that they naturally receive from the alternation of seasons; kept constantly in a growing state, their excitability is gradually destroyed, and death ensues as a matter of course. The mode of treating them most successfully may be collected from the following account of their management at Eaton Hall, given in the *Transactions of the Horticultural Society*.

'December, 1826, when the leaves were decayed, I dug up the bulbs or tubers out of the stone cisterns in which they had grown for years, and put them into pots according to the size of the tubers, and plunged the pots in water to within an inch of their rims. They remained in this situation until the pine-stove till the plants began to show leaves in the April and May following. They were then planted in cisterns and in glazed earthenware pots in which were the following soils:—in the bottom, four inches of strong clay made solid; above this, six inches of light mellow loam, and at the top, an inch or two of sand to keep the water clear. The cisterns, which are made of Yorkshire flags, are of the following dimensions,—3 feet long, 1 foot 8 inches broad, and 1 foot 4 inches deep. They were placed upon the effluves of pine-pits where the fire enters and escapes, and they were elevated with bricks to within eight and twelve inches of the glass. The glazed pots were from fourteen to eighteen inches in breadth and depth, and were similarly placed, except a few that were plunged in corners of the melon-pits. They were kept constantly full of water, and frequently was made to run over in order that the water might be kept pure. The temperature of the pits was seldom under 80°, and in sunshine often above 100° of Fahrenheit. No air was admitted at the lights immediately above the plants. As the plants increased in growth, they put out many runners, which were pinched off close to the tubers. When the roots reached the clay, the leaves got very stiff, raising themselves on the sides of the cisterns.

'The *Nymphaea cærulæa* and *N. odorata*, under similar treatment, produced abundance of flowers. The first flower of *N. rubra* opened on the 13th of August: on the 15th it was fully expanded, and measured over the disk five inches and a quarter. The same plant produced another

flower in September, somewhat larger, and with nineteen petals, many more buds were formed, but they opened very indifferently towards the end of September; in October the plants began to lose their leaves. When this was accomplished, the tubers were taken out of the cisterns and put into small pots as before stated. The last was done this day (December 11, 1827).

The *Nelumbium speciosum*, in a glazed pot, with similar treatment, plunged in leaves in the same pit, has flowered well and ripened seeds.

Various other methods have been recommended; but they all depend for their success upon keeping in view the principle of periodical rest and rapid growth under a high temperature, with but little air during the season of vegetation.

Some very good practical observations on the management of both hardy and tender aquatics have been given by Mr. Kent, in the 3d volume of the *Horticultural Transactions*, p. 24.

AQUATINTA ENGRAVING. The word *aquatinta* is a compound of two Latin words, *aqua* (water) and *tinctus* (stained), by which is implied that this mode of engraving is an imitation of water-colour or India-ink drawings. The inventor, a German artist named Le Prince, was born at Metz in 1723. His method was to sift the common black resin, when tied up very loosely in a muslin bag, and being shook over the plate, the surface was partly covered with the particles: this method is, in some cases, still adhered to. It was then fixed by a moderate heat sufficient to make the dust adhere without fluxing or becoming an even varnish: he thus formed a granulated surface on the plate, usually called a *ground*, which suffered very little from the action of the diluted acid, yet allowed it to corrode very freely in the small spaces left between the grains of the resin. Mrs. Catherine Prestel, also a German, improved much upon the meagre works of Le Prince, and executed several large works with so much success, that little more was found wanting than a ground that would adhere better to the plate and yield a greater number of impressions; this was effected by dissolving the black resin in the highest rectified spirits of wine (alcohol), and then pouring the mixture over the plate, the quantity of resin determining the coarseness or fineness of the grain. When the plate is large, it is necessary to have a broad and shallow tin pan (with a spout at one corner) in which the plate is laid inclining from the upper edge, so that the superfluous ground may be saved; this must be quickly returned to the bottle, and the plate laid, inclining a little, on a table, so that the ground may run to the lower edge, where it is wiped off from the extreme edge with a cloth. When the ground is quite dry, the surface will be of a bright copper colour, and in a few hours will be ready for use. A warm room is requisite for this operation in cold weather, but if hot, the early morning must be taken. Dust should be most carefully avoided. A small plate may be held on the points of the fingers and thumb of the left hand whilst the ground is laid, and be gently moved about till the ground has granulated or formed; this aids the better formation or crystallization of the grain: before a ground is laid, the plates are to be well cleansed with dry whiting and a dry linen cloth, it being absolutely necessary that the plate should have a very perfect polish, for without this the granulation cannot be well effected. Any of the resinous gums will, with spirits of wine, make a ground, but the black resin is generally preferred. As the proportions cannot be given, it is usual to have a bottle in which the ground is much too strong for use, and to make it ready in another by mixing a little of the strong ground with sufficient spirits of wine. The modern aquatinters have another advantage over their predecessors in using a composition for painting the forms of leaves of trees, or other objects, where the trouble of surrounding the forms by a varnish would be too great. This composition is made of moist sugar or treacle added to the same bulk of whiting, and ground well on a slab with a little water; a very small proportion of gum Arabic or gamboge may be added. When this composition is used, it must be thoroughly dry before the varnish is passed over it; the varnish also must be allowed time to dry, after which, cold water poured on the plate will in a few minutes bring off all the composition and the varnish which had passed over it, leaving the forms perfect and the ground in those places free to receive the acid again—the remainder of the plate being permanently

stopped out by the varnish: this varnish is either Canada balsam or turpentine varnish mixed with a little lamp-black and spirits of turpentine; with this also the margin of the plate is to be varnished, leaving a narrow strip of the ground for trials. These trials are made, after each time that the acid has been on the plate, by taking off a small portion of the strip with spirits of turpentine, cleaning the place well, and then rubbing in with the finger a little powdered white lead; this process will give a good idea of the actual and comparative strength of tints. It is only by these trials that the aquatinter knows what he is doing, for the acid varies so greatly with the weather, that what might be considered very weak in a cool morning, becomes very strong towards the evening; for this and other obvious reasons, if the room be kept at an equal temperature, the work will advance with much greater certainty than when it varies by the changes of weather. The design intended to be engraved is then made on the ground; this is done in the following manner:—The design is first copied on very thin transparent paper, called tracing-paper; between this tracing and the prepared ground on the plate a thin sheet of paper is placed, which has been rubbed over with lamp-black, or vermilion, and sweet oil; every line of the design is then gone over with an instrument called a blunt point, with a moderate pressure, and is thus transferred to the ground so securely that the acid cannot destroy it.

Before the acid is poured on the plate, a border or wall of wax, about an inch in depth, is placed round the margin of the plate. The bordering wax is made by melting together one pound of burgundy pitch, half a pound of bees' wax, and a wine glass full of sweet oil; when melted, to be poured into cold water and worked into small cakes. When wanted, these cakes are put into lukewarm water and made into small rolls like a sausage, then flattened, and one of the edges being a little melted at the fire, is to be pressed close to the plate with a wet finger, making a spout at one corner; this should be well performed, or the acid will get beneath it and occasion much mischief. In order to make the wax adhere, the plate should be made as warm as the hand of the operator.

The plate being so far made ready, the completion of the design is resumed by stopping out the highest lights on the edges of clouds, water, &c., with a mixture of Canada balsam or turpentine varnish, and the perfectly impalpable oxide of bismuth (bismuth is preferred on account of its weight); these are mixed with a spatula on a slab, and used with a small sable brush, diluting the varnish occasionally with spirits of turpentine. Next pour on the acid, which has been prepared by mixing one-sixth of a pint of the strongest acid to five-sixths of a pint of water; let it remain, according to its strength, from half a minute to a minute, then pour it off, and wash the plate three or four times with clean water, and dry it with a clean linen cloth or a pair of bellows: the last is the best, if the stopping-out varnish should not be perfectly hard. If on trying the strip the tint is found not to be sufficient, repeat the acid for another half minute, and then proceed. The colour of the bismuth varnish must be changed for the second stopping-out, by adding a little chromic yellow, vermilion, or lamp-black, or any other colour that is not destroyed by the acid. The colour is to be changed after each application of the acid, that the engraver may remember in what places he has carried forward his work, what tints have been softened at their edges, &c.

It is impossible to give a scale of times for each employment of the acid, but the following may serve as a guide. If the first tint has half a minute, the second may take three-quarters, the third one minute, the fifth one minute and three-quarters, the sixth two minutes and a half, the seventh five minutes, the eighth twelve minutes. &c. The acid should be strengthened a very little after each application; and it may be so equally done that the above proportions will serve very well as a general rule, depending on the strength of the tints required. When the ground changes to a grey colour it is beginning to fail, and must be taken off by heating the plate till the bordering wax will lift off; after this, sweet oil is applied to the whole surface, and a brisk heat beneath the plate will bring off all the different varnishes with a linen cloth; then an oil rubber, made of fine woollen cloth, rolled up hard and the end cut off, applied with sweet oil, will take out the stains; tints which are too strong may be softened or even rubbed out. Perhaps it

need not be added, that a single grain of sand or any other hard substance under the rubber will ruin the whole work. Gradations in skies, &c. are sometimes made in this manner, though more generally by pouring the acid on slowly, beginning at the darkest corner. It will frequently happen that some portions of the varnishes will become so hard, that the common method will not stir them; in this case a little of the oil of spike lavender applied with the finger is quite certain to produce the effect. The plate is now cleaned with spirits of turpentine and sent to the printer to prove, after which it is to be exceedingly well cleaned with turpentine, &c., and another ground laid; this should be done in such a manner as to make the grains fall exactly on the granulations of the former ground, which is called *re-biting*. It is done by making the ground much stronger than was used before. Fortunately, the liquid ground has a natural tendency to granulate upon the same places as before, and when the acid is again applied it will act in the same interstices as before, and only wants a little care to make it answer. The process for the second ground is the same as for the first; re-touching with the acid those tints which require more depth, and stopping out those parts that are sufficiently dark. Another proof must be taken, and the plate then finished with the burnisher, which some use with oil, but others prefer it dry, previously filling the whole plate with powdered white lead, by which it can be seen how much has been burnished down, according to the quantity of colour left in the plate.

It is to be regretted that aquatinta engraving has suffered much odium from the facility with which inferior plates can be produced; but it is capable of the greatest beauties, as may be seen in the justly-celebrated plates to the *Hunchback*, by W. Daniell, Esq. R. A.; Mr. Ostervald's work *On Sicily*; and many others.

AQUA TOFANA, a poisonous fluid invented about the middle of the seventeenth century by an Italian woman of the name of Tofana. This woman, who resided first at Palermo, and afterwards at Naples, was one of the most celebrated of a class of persons known under the name of Secret Poisoners [see POISONING, SECRET], who in antient times were believed to possess the power of destroying life at any stated period, from a few hours to a year; and who, during the sixteenth and seventeenth centuries, were regarded in all the nations of Europe with extraordinary terror. In the year 1659, during the pontificate of Alexander VII., it was observed at Rome that many young married women became widows, and that many husbands, suspected to be not agreeable to their wives, died suddenly. The government used great vigilance to detect the poisoners; suspicion at length fell on a society of young wives, whose president appeared to be an old woman, who pretended to foretell future events, and who had often predicted very exactly the death of many persons. By means of a crafty female their practices were detected; the whole society were arrested and put to the torture, and the old woman, whose name was Spara, together with four others, were publicly executed. It appears that Spara, who was a Sicilian, derived her art from Tofana at Palermo, the latter selling the poison, which from hence acquired the name of 'Aqua della Tofana,' in small glass phials with this inscription, 'Manna of St. Nicholas of Barri,' and ornamented with the image of the saint. Though this infamous woman lived to an advanced age, she was at length dragged from a monastery, in which she had taken refuge, and put to the torture. She confessed that she had been instrumental to the death of no less than 600 persons. The dose of her poison was from four to six drops: yet though, in this state of concentration, its nature could not be detected, it was subsequently discovered to consist of a solution of arsenic; but so little was that age acquainted with the art of chemical analysis, that they had no means of detecting a solution of arsenic so highly concentrated that from four to six drops was a mortal dose, whereas, at present, even when arsenic has been dissolved in the stomach and mixed with vegetable and animal fluids, it may be reduced to its metallic form, and made to exhibit all the physical properties of the metal to the *naked eye*, with as great distinctness as in any quantity, however large, *when only the twentieth part of a grain has been procured*. Modern chemistry, therefore, has deprived the poisoner of all chance of escape by concealing or disguising the poison he administers.

AQUEDUCT, or **AQUÆDUCT** (*aquæ ductus*), as it was formerly more correctly written, is composed of two

Latin words, *aqua*, in the genitive case *aquæ*, and *ductus*, signifying together, a conductor or conduit of water. In this, its more extended sense, the term aqueduct may be applied to all sorts of pipes and channels for the conveyance of water, but it is commonly restricted in its application to constructions of a somewhat peculiar description, which have been formed above the surface of the ground for the purpose of conveying streams of water in a regularly, but slightly descending current across valleys and over plains, from one comparatively high point to another. The canal or conduit called the New River, by which water is brought into London from a distant source, is strictly an aqueduct, but it is not what is generally understood by the term, in any part of its length. Indeed we have not in this country an example of the sort of structure which the term designates, though it may be exemplified by some of the canal and railway ducts in the north of England and in Scotland, such as Barton Bridge, in Lancashire, which carries the Duke of Bridgewater's canal over the river Irwell; the bridge which carries the Edinburgh and Glasgow Union Canal over the valley of the water of Leith at Slateford; and the Sankey viaduct in the line of the Liverpool and Manchester railway. The former of these have been sometimes called aqueducts, but this application of the term only leads to confusion, unless *bridge* be superadded; structures for the purpose of carrying a canal are indeed more strictly viaducts than aqueducts. Nevertheless, such is the form and structure of an aqueduct,—a series of piers equidistant, or nearly so, with arches connecting their heads to form one continuous and nearly level line, on the back of which is the channel or water-course.

We do not read of any aqueducts, properly so called, till the Roman period, yet contrivances for the conveyance of water from a distant source for the supply of a city are of great antiquity. Herodotus (iii. 60) describes the mode in which Eupalinus, an architect of Megara, supplied the city of Samos with water. A hill 900 Greek feet high was pierced by a tunnel seven stadia, or 4200 feet long. The tunnel was eight feet high and eight feet wide, and in it there was cut a channel thirty feet deep (if the text is correct) and three feet wide, through which the water was conveyed in pipes (*ὀχετεύομενον διὰ σωλήνων*) from a large source to the city. In translating the word *σωλήν* (*solēn*) by the usual term 'pipe,' we do not mean either to assert or deny that pipes, properly speaking, of wood or metal, were used on this occasion: the word may here signify merely channel stones.

Aqueducts were most extensively used by the Romans, and on the sites or in the vicinities of many of their more important cities in Asia and Africa, as well as in Europe—in Greece, Gaul, and Spain, as in Italy and Sicily—parts remain, even to the present day, of extensive constructions of the kind. That of Segovia, for instance, in Old Castile, erected in the time of Trajan, is a magnificent work. The neighbourhood of the city of Rome itself is pre-eminently distinguished by a long series of these almost imperishable memorials of her antient magnificence.

The aqueducts of the Romans were built, for the most part, of brick, and consisted, as we have said, of nearly square piers running up to the same height,—the necessary fall of the course being considered—and connected by semicircular arches, over which the conduit ran. This conduit had a paved or tiled floor, and was inclosed laterally by walls of brick or stone, and covered with a transverse arch, or by a simple flat coping of stone. This species of conduit frequently involved a serious difficulty, for if the source of the water conveyed were much higher than the place at which it was to be delivered, and the distance too short to reduce the flow of water to a proper velocity, the stream had to be carried in a winding direction to expend the height in a greater length. Otherwise, the pressure of water from the head would burst or blow up the covering arch or coping of the aqueduct, render the work useless, and inundate the country over which it was attempted to carry it.

Some idea may be formed of the extent and importance of the Roman works of this kind when it is stated, that Rome was supplied with water from sources varying from thirty to sixty miles in distance, and that at one period of its history no less than twenty aqueducts brought as many different streams of water across the wide plain or Campagna in which the city stands. Great portions of the distance were

of course in every case occupied by artificial channels winding along the sides of hills and mountains; and long tunnels carried the streams through these natural barriers when occasion required, but nevertheless the arcaded duct led the streams across the deep valleys, and the aqueduct was in every case required to carry it onwards from the hills over the wide plain to the doors of the eternal city. These metropolitan aqueducts were of various lengths, according to the direction in which they came, but in one of them the series of arches is calculated at nearly 7000, their height being in many places more than a hundred feet. There is nothing more interesting or more really beautiful in the existing ruins of ancient Rome than the remains of these splendid works, which radiate, in almost every direction, and run across the almost level plain out of which its hills arise in long arcaded series, whose simplicity and unbroken continuity produce a degree of grandeur unmatched by the more laboured and more pretending works within the walls.

Sextus Julius Frontinus, who was inspector of the aqueducts of Rome under the Emperor Nerva, has left a treatise on this subject, which contains much curious information. [See FRONTINUS.] Some of the more remarkable aqueducts will be noticed under the names of the cities to which they belong, or the individuals whose name they bear. The modes in use, both in ancient and modern times, for distributing water through a large city when brought to the great reservoirs will be noticed under the head of WATER and WATER-PIPES.

Modern Rome is abundantly supplied with water by three of the ancient aqueducts, which have undergone repairs and restorations: the most important was made by that great papal reformer, Sixtus V., from whose conventual name of brother Felix (Fra Felice) one of the streams so delivered is called the Acqua Felice.

Aqueducts have been constructed in modern times, and of these the most celebrated are that of Caserta in the kingdom of Naples, of Maintenon near Versailles in France, and that of Bemfica, called *Agoas Livres*, near Lisbon in Portugal.

AQUIBA, אֶקִיבָּה, or Akibah ben Joseph, called by Epiphanius and Hieronymus Barakiba, lived at the end of the first and at the beginning of the second century A.D., and was president of the academy at Lydda and Tabea, his disciple and successor of rabbi Gamaliel, and one of the most famous doctors of the Mishnah. The Jews assert that things which were unknown to Moses were revealed unto Akibah. According to Jochia, the greatest part of the Mishnah originated from the verbal and written instructions of Akibah. According to Zakat, *the whole* of the Mishnah came from Akibah, who lived 120 years. When he was forty years of age he fell in love with the daughter of Kalba hwa, in whose service he lived as herdsman. She promised to marry him if he became a rabbi. Akibah studied forty years with great zeal, and had 24,000 disciples, among whom was rabbi Jose, the author of the Great Jewish Chronicles. [He joined the pseudo-Messias, Bar Cocheba (Coziba), who caused disturbances in Judea. The Emperor Hadrian, in whose time the insurrection took place, after taking Bitter Bethara, put many Jews to death, and ordered Akibah to be killed by iron combs, with which his skin was taken off. Akibah was buried in Tiberias, where his tomb was annually visited by his admirers between Easter and Pentecost. The book *Jezirah* (יֵצִרָה), which some ascribe to him, and others attribute to Akibah, is the chief book of cabalistic doctrines. The two last editions of this famous book are by Rittangel, with a Latin translation and commentary, Amst. 1642, 4; and lately, by Friderich von Meyer, Frankfurt on the Main, with a German translation, 1832, 4to.]

AQUILA (the Eagle), a constellation situated above, so as to rest on, Capricornus and Aquarius. It may be readily found by means of the head of Draco and the bright star α Lyrae, since a line passing between β and γ Draconis, and through α Lyrae, passes through a bright star of the first magnitude, α Aquilæ, cutting also two stars of the third magnitude, β and γ , situated directly above and below α . This constellation is on the meridian at 8 o'clock P.M. in the middle of September, at about 40° of elevation. Its principal stars are here given, as in preceding constellations. The number inclosed in a parenthesis is that of Piazzi.

In the Greek mythology this constellation represents the eagle of Jupiter. According to some, it is the bird which was the tormentor of Prometheus. M. Dupuis conjectures, but with very little probability, that the name was given when Aquila was near the summer solstice, and that the bird of highest flight was chosen to express the greatest elevation of the sun.

The constellation Antinous is usually considered as a part of Aquila, and is treated as such in catalogues. It is represented as a boy in the grasp of the eagle, and its principal stars are η , θ , ι , κ , and λ , in the above catalogue. It is said to have been placed in the heavens by the order of the Emperor Hadrian, in memory of a favourite of that name, who is generally supposed to have perished in the Nile, A.D. 131. Others have supposed it to refer to the fabulous history of Ganymede, who was carried to heaven by the eagle of Jupiter; but this is rendered unlikely by the silence of Ptolemy, who, though he speaks of the group of stars in question, does not call them the constellation Antinous, but simply 'unformed stars, among which is Antinous.' Had the two figures originally contained any reference to the mythology above alluded to, it is most probable that the constellation would have been regularly distinguished long before the time of Ptolemy.

AQUILA, a considerable town in the kingdom of Naples, and the chief place of the province called Abruzzo Ultra Primo. It is situated six miles south of the ruins of Amiternum, a town of the Vestini, and the birth-place of the historian Salustius, where remains of an amphitheatre and other buildings are still seen near the village of San Vittorino. Remains of another town, called Forconium, an episcopal see in the early Christian ages, and which was ruined by the Longobards, are found about four miles south of Aquila, near a place called Bagno. The origin of Aquila appears to have been in the twelfth century, when the inhabitants of various ruined towns in that neighbourhood thought of uniting and building a place of defence against the incursions of foreign and domestic depredators, so common in that age. Frederic II., emperor and king of Sicily, is, however, considered as the real founder of Aquila, having given it a diploma or charter, assigning to the new city a territory which comprehended the two districts of Amiternum and Forconium. The name of Aquila is said to have been first given by him in honour of the emblem of the imperial eagle. He wished to make the new town a bulwark of his kingdom on the frontier of the papal states. In 1254 the episcopal see of Forconium was transferred to Aquila. This city became populous and powerful, and acted a conspicuous part in all the wars that followed the first French invasion of the kingdom under Charles of Anjou. It generally took part with the popes and the Angevins against the Aragonese.

After Charles V. had taken possession of Naples, the French, under General Lautrec, having invaded the kingdom, took possession of Aquila; the imperial army, however, retook it soon after, and the prince of Orange, who

commanded in the name of Charles, irritated by the disaffection of its inhabitants, laid enormous contributions on them, in order to pay which all the plate and the treasures of the churches were taken. Numbers of the citizens were imprisoned, and many outrages committed by the soldiers on the inhabitants. This occurred in 1529. The plague, which broke out soon after, completed the desolation of the city, which never after recovered its former prosperity. It was long considered the first city in the whole kingdom next to Naples, and it could muster 15,000 armed men at the sound of the alarm-bell. Charles V. built the castle, which is situated in the highest part of the city, and was considered very strong at the time. Aquila is on the slope of a hill, at the foot of which the river Aterno or Pescara flows. It commands the view of a fine valley about sixteen miles in length, watered by numerous springs, and productive in corn, fruit trees, flax, and especially saffron. The hills are covered with vineyards, and the lofty Apennines, which rise behind on both sides, afford pasture in summer to numerous herds of cattle and flocks of sheep. The chain to the north-east of Aquila is overtopped by Monte Corno, and that to the south-west by the mounts called Della Duchessa, which divide the valley of the Aterno from that of the Salto, a branch of the Velino. [See ABRUZZO.] Aquila has manufactures of linens, paper, leather, and woollen cloths: its comfits or sweetmeats have a great reputation. Its population, according to the Italian itineraries of 1830, is 13,000. The walls are above three miles in extent, but a great portion of the enclosed space is now occupied by gardens. It had once twelve gates, eight of which have been blocked up. Aquila has declined, while Chieti, Lanciano, Teramo, and other towns of Abruzzo, have increased.

The province of Aquila, which once occupied the largest part of Abruzzo, has been of late years divided into two *intendenze* or divisions, the chief towns of which are Aquila and Teramo. Aquila is the residence of the *intendente*, and also of a military commandant: the civil and criminal courts for its division are held here. It has also a lyceum. The streets, though generally narrow, are straight, and it has two squares ornamented with fountains. The palace of justice, or town house, and the episcopal palace and cathedral, are its principal buildings. It reckoned once above one hundred churches, and numerous monasteries, besides twelve nunneries: many of the churches, however, had fallen to ruin already in the last century. Others have been since suppressed.

Aquila is the residence of many families of the provincial nobility. Its inhabitants speak Italian, like their neighbours of the Roman state, and not dialect, as the rest of the kingdom. It lies in 43° 20' N. lat., 13° 28' E. long., 106 miles N.N.W. of Naples, and 57 N.E. of Rome. There is a post road from Aquila to Sulmona, 32 miles distant, and from thence to Naples. A mountain road leads from Aquila over the pass of Antrodoco to Rieti in Sabina, and from thence to Rome. (Bernardino Cirillo, *Annali della Città dell' Aquila*.)

A'QUILA, Ἀκύλας, **עקיλάς**, was, according to Epiphanius, *De Ponderibus et Mensuris*, cap. 15, a relative of the emperor Hadrian, and converted from idolatry to Christianity, but afterwards excommunicated on account of his idolatrous astrology. He embraced Judaism, was circumcised, and translated the *Old Testament* literally into Greek (Iren. iii. 21; Euseb. *Demonst. Evang.* vii. 1; Hieronymus, *ep. ad Pammach.* Opp. ed. Mart. t. iv. p. ii. p. 255). Aquila adhered so strictly to the Hebrew text that he translated **בְּרִאשִׁית** *ἐν κεφαλῇ*, **יָצָר** *στυλῶνότης*, **אֱלֹהִים** by *ὁὐν*, **אֲנָשִׁים** *ἀνδρῖς*. The word **עַל מַחְ** Jer. vii. he translated *καὶνῆς* and **מִשִּׁיחַ** anointed, or the Messiah, Ps. ii. *ἡλειμμένος*, and con-

sequently the Jews preferred his translation to the Septuagint. It appears also from Irenæus, iii. 24, that the Ebionites used the translation of Aquila in order to support their Judaizing tenets. The remains of this translation have been edited by Montfaucon, Martianay, and others, in the *Hexapla* of Origen. [See *HEXAPLA*.] *Dathe de Aquilæ Reliquis Interpretationis Hosæ in Opusculis Dathii* ed. Rosenmüller, Lips. 1746, 8. Schleusser, *Opuscula Critica ad versiones Græcæ Vet. Test. pertinentia*, Lips. 1812, 8; Capelli, *Critica Sacra*, ed. Scharfsenberg, l. v. c. 3. t. ii. p. 805. The translator עֲקֵלוֹס, in the Talmud of Jerusalem, is called in the Talmud of Babylon אֲנְקֵלוֹס, Onkelos. [See *ONKELOS*.]

AQUILE'GIA, literally the *Watergatherer*, because the leaves collect water in their hollow, is a small genus of plants, commonly called *Columbines*, belonging to the crow-foot tribe, of which several species are cultivated in gardens. They are known from aconitum, to which they are the most nearly related, by the leaves of the calyx being all of the same form and size, and by the petals having each a long curved horn or spur at the base. All the species are handsome perennials, easily propagated by dividing the crowns of their roots: the commonest, hence named *A. vulgaris*, is found in woods and thickets in this and all other parts of Europe; it has produced many varieties, differing in the colour of the flowers, and in the multiplication of the petals, for the sake of which it is commonly cultivated. The other species are found either in the north of Asia, or in North America. They are all acrid plants, but so much inferior in virulence to aconite, that no attention has been paid to their qualities.

AQUILEIA, a town of the antient Veneti, whose origin is lost in the obscurity of the ante-Roman ages, was made a Roman colony in the year 181 B.C., and became the first city in the Venetia, and the bulwark of Italy on the side of Illyricum and Pannonia. It was built near the right or western bank of the river Sontius, now Isonzo, in a low and fertile plain, watered by numerous rivers. It was a place of great trade, for, although several miles distant from the coast of the Adriatic, vessels could reach it through canals which communicated with the rivers Natissa and Anfora, which flow near it. Its walls were twelve miles in extent, and the city was adorned with an amphitheatre and other splendid buildings. The Via Æmilia, a continuation of the Flaminian road from Rome, led through Ariminum and Bœstia to Aquileia. Augustus, Tiberius, and other emperors occasionally resided in this city. The poet Cornelius Gallus was born here. Aquileia distinguished itself for its fidelity to Rome. When the Thracian Maximinus, after the death of Alexander Severus, was proclaimed emperor by the legions of Pannonia, and afterwards outlawed by the Roman senate, he marched against Italy to avenge himself. The citizens of Aquileia boldly opposed his passage, and sustained a siege, during which the women vied with the men in the defence of the town. The soldiers of Maximinus, disheartened by this unexpected resistance, and the delay thereby occasioned to their intended march upon Rome, retreated and killed Maximinus and his son, A.D. 241. The Roman senate, relieved of its fears, voted thanks to the Aquileians.

Aquileia, from its situation, was exposed to the attacks of Alaric and the other barbarians who successively invaded Italy from the north-east. The famous Attila last stormed it, after an obstinate defence, pillaged, and destroyed it by fire, after butchering the greater part of its inhabitants, in the year 452. Some of those who escaped took refuge in the neighbouring island of Grado, where they built a town of that name, and where the bishops of Aquileia resided for a time. It was about the same epoch that many fugitives from various towns destroyed by Attila escaped to the islets in the lagoons, where afterwards Venice was built. In the year 489, Theodoric and his Goths defeated in the plains of Aquileia Odoacer, king of Italy. Aquileia was afterwards restored by Narses, the general of Justinian, but it never recovered its former splendour. The see of Aquileia was one of the oldest in Italy; its first recorded bishop, Nicomagus, is said to have lived under the Emperor Nero. There is also a tradition that St. Mark the evangelist was the first bishop of Aquileia, and that he wrote there his Gospel, a MS. of which, pretended to be an autograph of the saint, was transferred to Venice in the fourteenth century, and deposited in the treasure-room of the church of St. Mark. During the first three centuries the chronology of the bishops of Aquileia exhibits several chasms, but for the beginning of the fourth the records of that see proceed without interruption. Towards the end of the same century it was made a metropolitan see, about the same time as Milan. Its jurisdiction extended first over Istria, and last over the whole of Venetia, and even as far as Como, and beyond the Alps, to the river Save, having twenty-seven bishops under it. Rufinus, the translator of Origenes, who carried on a bitter controversy with St. Jerome, was a priest of the church of Aquileia. In the sixth century a schism arose between the see of Aquileia and that of Rome, which continued for two centuries, during which we find often two bishops for the same see, one orthodox at Grado and the other schismatic at Aquileia. It was then that the

metropolitans of Aquileia assumed the title of patriarchs, which was used in the Greek Church, and had been adopted by the Goths and other Arians. When the Longobards invaded Italy under their king Alboin, the patriarch of Aquileia removed to Grado with the treasures of the church. In the subsequent wars between the Longobards and the Greeks, and afterwards the Franks, many families emigrated from Aquileia to Venice. Charlemagne and his successors bestowed privileges on the see of Aquileia, which had already become reconciled with that of Rome; and Otto II. gave it the castle of Udine and other estates in the March of Frioul (Forum Julii); and Conrad II. and his successor Henry III. enlarged still more the dominions of the see, giving it almost the whole of Frioul and Istria, so as to render the patriarch a sovereign prince, and a great feudatory of the empire, with power of coining money, raising troops, &c. Rome had acknowledged his title of patriarch, which was a singularity in the western church. Pope John XIX. qualified the see of Aquileia as 'being second in rank to that of Rome, and above all other episcopal sees in Italy.' Pope, who was patriarch about that time, restored the walls of Aquileia, and built a magnificent temple, with a lofty tower, which he dedicated to the Virgin Mary, making provision for fifty priests to officiate in it. This was to Aquileia a period of revived prosperity. But the wars between Frederic II. and the popes, and the factions of the Guelphs and Ghibelins, came again to disturb the country; and these, added to the growing unhealthiness of Aquileia, occasioned by the stagnant waters around, induced the patriarchs, in the thirteenth century, to remove their residence to the castle of Udine, which town then rose on the decline of that of Aquileia. From that time Aquileia became desolate, and by degrees dwindled away to a mere unhealthy village. The patriarchs, however, continued to govern the country of Frioul as independent princes, and to exercise their spiritual jurisdiction over the numerous dioceses subject to them. They were frequently at variance with their neighbours, the Venetians, the Paduans, the dukes of Carinthia, the counts of Gorizia, and the dukes of Austria, and sometimes with their own subjects. At last, in 1420, the Venetians conquered Frioul, and Udine submitted to them. Thus ended the temporal dominion of the patriarchs. Their spiritual authority they retained to a much later period, until the year 1758, when, in consequence of disputes having arisen between the Venetian senate and the court of Austria about the right of nomination to the vacant see, the patriarchate was finally abolished, with the consent of the pope, and its diocese divided into two episcopal sees, Udine and Gorizia. The province of Frioul continued under the Venetians until the fall of that republic in 1797. Aquileia, or rather its remains, form now part of the circle of Istria, in the government of Trieste, in the Austrian monarchy, being just outside the frontiers of the Lombardo-Venetian kingdom, the Italian boundary being two or three miles to the west of Aquileia. The road from Venice to Trieste passes through Palmanova, about eight miles north of Aquileia. (Johannes Candidus, *Commentariorum Aquilejensium*, libri viii.: De Rubens, *Monumenta Ecclesiæ Aquilejensis*.)

AQUINAS, THOMAS, that is, Thomas of Aquino, in Naples. This famous theologian was of very distinguished birth, being a younger son of Landulf, count of Aquino, and lord of Loretto and Belcastro, who was nephew of the Emperor Frederic I., the celebrated Barbarossa. He was born in 1227, some authorities state in the town of Aquino, others in the castle of Rocca Secca, the seat of his family, near the monastery of Monte Casino. Having been sent at five years of age to the neighbouring monastery to receive the rudiments of his education, he remained there till he was nearly thirteen, when he proceeded to the university of Naples, which had been founded in 1230 by his relation, the Emperor Frederic II., grandson of Barbarossa, and had already acquired great reputation. From his earliest years he had shown a love of study, and the circumstances of the time were, in various respects, such as naturally tended to encourage the preference which he was thus led to form for a literary, or at least a meditative, life. His native country was distracted by civil dissensions, in which if he was to mix, the trade of arms alone offered him any chance of distinction. On the other hand, a fervent excitement had been recently awakened among all classes by what were then esteemed learning and philosophy, which, puerile and misdirected as their spirit might to some extent be, at least afforded an intellectual exercise, and therefore ad-

vanced the world a most material step in civilization. About 1217, the order of preaching friars called after his name had been founded by St. Dominic; and of this body, already in the enjoyment of vast popularity, the young nobleman proposed to become a member. On his earnest entreaties the superior of their convent at Naples was prevailed upon to admit him as a novice. He was at this time in his fifteenth year, and the important step upon which he had ventured was taken without the knowledge of his parents. As soon as they heard of what he had done, his mother hastened to Naples in the hope of inducing her son to change his resolution. On finding that, to avoid her, he had taken flight for Rome, she proceeded after him to that city, but there learned that he was already on the road to Paris. He was, however, apprehended on his way by the exertions of his two elder brothers, who then held commands in the army of the emperor in Tuscany, and brought back to Rocca Secca. But no entreaties or other inducements could prevail upon him to give up his determination; and at length, after about a year had elapsed, the friars got both the emperor and the pope, Innocent IV., to interfere in the case, and by their command Aquinas was permitted to return to his convent. With the view, probably, of effectually preventing all further attempts to withdraw him from his chosen vocation, he soon after (in 1243) made profession, and then went to Cologne to attend the theological and philosophical lectures delivered by Albertus Magnus in the Dominican convent there. Here, from his silence, which, however, was not that of stupidity, but of meditation, he is said to have been named by his fellow-students the Dumb Ox. His teacher, however, detected the genius that was wrapped up under this taciturnity, and remarked, that if that ox should once begin to bellow, the world would be filled with the noise. After remaining a few years at Cologne, he accompanied Albert on a visit to Paris, from which they returned together in 1248. Aquinas was then ordained a priest. He returned to Paris in 1253. Soon after this he published the first work by which he distinguished himself as a writer, a treatise in defence of the monastic life, in answer to a doctor of the Sorbonne, who had attacked the privileges of the new mendicant orders. He afterwards defended his positions in a debate with his opponent, in the presence of Pope Alexander IV. This, and some other exploits of a similar kind, acquired him the highest reputation in what was then deemed the chief of intellectual feats—the dexterous use of the weapons of the Aristotelian metaphysics and logic. In 1253 Aquinas received from the University of Paris his degree of doctor in theology; and he afterwards spent several years in that city, lecturing publicly with immense applause. In 1272, however, he returned to Italy, and for two years taught theology at Naples. Pope Gregory X. having then requested his presence at the general council which had been summoned to meet at Lyons, with the object of effecting a union between the eastern and western churches, he prepared to set out for that city, but first paid a visit to his niece, Frances of Aquino, the wife of the Count Annibal de Ceccano. Having arrived at their residence, the castle of Magenza, he was there suddenly attacked by fever, on which he desired to be removed to the neighbouring Cistercian monastery of Fossi-Novu, in the diocese of Terracina; and here he expired on the 7th of March, 1274, in the forty-eighth year of his age.

The honours paid to Thomas Aquinas, both during his life and after his death, comprise nearly all the highest distinctions by which men have ever testified their admiration of intellectual eminence. Popes, kings, emperors, learned bodies, and great cities, contended for his presence during his life; and as soon as he had ceased to live, the order to which he belonged, the monks of the abbey in which he died, and the University of Paris, of which he had been an alumnus and a graduate, disputed the right to the possession of his body. It was not till nearly a century afterwards that this latter controversy was terminated by the removal of his remains on the 28th of January, 1369, to the Dominican convent of Toulouse, where a magnificent tomb erected over them still remains. Before this he had been canonized by Pope John XXII. by a bull dated the 18th of July, 1323. Pope Pius V. also declared him a doctor of the church in 1567.

The piety and moral virtues of St. Thomas Aquinas have received the warmest commendations from his contemporaries. His religious sincerity and fervour appear to have been accompanied by unaffected humility; and also by a

mildness of temper that has not always been the grace of eminent theologians. The popularity of his writings was formerly so great that there have been at least five or six editions of the complete collection. The best edition is considered to be that printed at Rome, in 1570, in seventeen volumes, folio. Various of his treatises have also been repeatedly printed separately. Of the whole the most famous is his *Summa Theologiæ*, which is still a favourite authority in the Catholic church. His *Commentary on the Four Books of Peter Lombard* (called the Master of Sentences) is another performance that was long in high esteem. He has also left Commentaries on several of the writings of Aristotle, which, however, he perhaps only knew in Latin translations made from the Arabic. A good many of the works that have been attributed to Aquinas are now admitted to be spurious; and doubts have even been entertained as to whether the '*Summa Theologiæ*' be really his. Of the theological opinions which he maintained, the most memorable is his assertion of the supreme and irresistible efficacy of divine grace. This doctrine was afterwards opposed by Duns Scotus; and it formed for ages a matter of violent controversy between the *Thomists* and the *Scotists*, as the followers of the two doctors called themselves. The writings of Aquinas are not likely to be very fairly appreciated in the present day; but though we had no other evidence than the recorded admiration which he excited in his own times, it would be impossible to doubt his extraordinary genius. His talents, too, appear to have been as extra as they were powerful. He wrote in verse as well as in prose; and some of the Latin hymns still used in the service of the Romish church are of his composition. He seems also to have been celebrated for his ready and pointed repartees. One which has been preserved is, his reply to Pope Innocent IV. when that pontiff, on some money being brought in one day when they were together, remarked, 'You see that the age of the church is past when she could say, Silver or gold have I none;—'Yes, holy father,' answered Aquinas, 'and the day is also past when she could say to the paralytic, Take up thy bed and walk.' There are other stories of the absence of mind which he sometimes showed in company when absorbed in some of his profound speculations. One day, while dining with Louis IX., king of France (St. Louis), he suddenly, after a long silence, struck the table with violence, and called out, 'A decisive argument! the Manichæans could never answer it!' Reminded of where he was by the prior of the Dominicans, who was also present, he asked pardon of the king; when his majesty expressed himself only anxious to get hold of the unanswerable argument against the Manichæans, and, calling in a secretary, had it taken down immediately. Rabelais alludes to another anecdote of this kind. (See *Pantagruel*, liv. iii. chap. 2, and the note of Duchat on the passage.) The titles of Aquinas, in the list of the scholastic doctors, are, the Angelic Doctor, and the Angel of the Schools. (See a few remarks on Aquinas in the notes to the translation of Richard de Bury's *Philobiblon*. Lond. 1832.)

AQUINO, an ancient but long since decayed town in the province of Campania or Terra di Lavoro, in the kingdom of Naples. It was a Roman colony, and a large and populous city in the time of Strabo: the Via Latina passed through it. Juvenal, the Roman satirist, was born at, or in the neighbourhood of, Aquinum. Pescennius Niger, one of the competitors for the empire after the death of Pertinax, was also a native of this place. Aquinum suffered greatly by the various invasions of the barbarians after the fall of the empire. It was at last utterly destroyed during the wars of Conrad and Manfred against the Popes, after the death of Frederic II. of Suabia. The chroniclers of the following centuries speak of it as a place in ruins, and containing but a few hundred inhabitants. It retained, however, its bishop's see and the feudal title of county. The famous St. Thomas was the son of a count of Aquino, and was born at Rocca Secca in the neighbourhood. At present Aquino contains hardly a thousand inhabitants; the ground is covered with ruins of buildings of various ages and styles, among which are the remains of a theatre and of an amphitheatre, and a lofty wall of square stones united without cement, which formed part of a magnificent Doric temple. Several columns about four feet in diameter lie prostrate around, as well as a large portion of the frieze with triglyphs and part of the cornice. From a hasty measurement taken by Sir R. C. Hoare, this temple appears to have been 190 feet in length, and above 60 in breadth. An old ruinous church, which is still called *Il Vescovato*, (although the see has been long

since transferred to Pontecorvo, where the bishop resides; is built on the site, and partly with the materials, of another ancient temple. Adjoining it is a triumphal arch of a mixed style, Corinthian and Ionic; a copious stream now flows between the arch, and, after supplying a neighbouring mill, runs to join the Liris. A native of the place, the nephew of the Canonico Bianchi, has collected copies of all the inscriptions which are found at Aquino and in the neighbourhood. Aquino lies six miles west of the town of San Germano, the ancient Casinum, in a plain between the rivers Melfa and Liris, bounded on the north-east by the mountain on which the monastery of Monte Casino is built. The air of Aquino is unwholesome; the village of Palazzuolo, three miles distant, enjoys a better air. [See MONTÉ CASINO.]

AQUITANIA, one of the great divisions of ancient Gaul. The limits of Aquitania are stated by Cæsar to have been the river Garumna, the Pyrenees, and the Ocean. The Garumna divided it from Celtic Gaul. The original Aquitanians are supposed to have been of Iberian race, distinct from the Celts. Cæsar did not go into Aquitania, but his lieutenant, the younger Crassus, made an incursion into it. The country, however, was not finally subjugated until the year 28 B.C., when Augustus sent Marcus Valerius Messala to conquer it. The poet Tibullus accompanied Messala in this expedition, which he has commemorated in his poems. In the division of Gaul into Roman provinces as settled by Augustus, the limits of Aquitania were extended northwards as far as the river Ligeris (the modern Loire), and eastwards to the Mount Cebenna, which formed the limits of the Narbonensis province. By this extension, Aquitania was made to include several large districts or tribes of Celtic Gaul, such as the Santones, Pictones or Pictavi, Bituriges, Arverni, Lemovices, &c. In the following subdivisions of Gaul under the later emperors, we find the Aquitania of Augustus divided into three provinces, viz., the Novempopulana, which comprised the greater part of the original Aquitania, between the Garumna, the Pyrenees, and the Ocean; its principal towns were Climberris, afterwards Augustonemetum, Burdigala, and Aquæ Tarbellicæ: the Aquitania prima bordering on the Ligeris, and whose capital was Avinionum, afterwards called Bituriges (now Bourges), and the Aquitania secunda, situated between the other two, and whose principal city was Burdegala (Bordeaux). Under the reign of Honorius, the Visigoths, after ravaging Italy, passed into Gaul and took possession of Aquitania; which they kept till Clovis, king of the Franks, defeated them in a great battle near Poitiers A.D. 507, and killed their king Alaric II. Aquitania then became part of the monarchy of the Franks; but under the weak successors of Clovis it was detached from it again, and given as an apanage to Charibert, a younger son of Clotarius II. We find in the beginning of the eighth century Eudes, duke of Aquitania, and a descendant of Charibert, at war with Charles Martel. The Saracens from Spain having invaded the country and pillaged Bordeaux, Eudes was glad to make his peace with Charles and to join him against the Mohammedans, who were utterly defeated by Charles between Tours and Poitiers A.D. 732. In 768 Waifer, Eudes' successor, was attacked by Pepin, who conquered the whole of Aquitania and reunited it to the French monarchy. But Aquitania had undergone another change in its southern limits. The Vascones, a Spanish people, finding themselves hard pressed by the Visigoths, crossed the Pyrenees and settled in the southern part of Aquitania, which from them took the name of Vasconia or Gascony, which it has retained ever since, whilst the more northern parts of the same province continued to be called Aquitania and afterwards by corruption, Guienne. The Vascones were conquered by Pepin and Charlemagne, but revolted again and formed an independent state, having their dukes, until the eleventh century, when they became united to the duchy of Aquitaine, which, under the successors of Charlemagne, had become one of the great fiefs of the French monarchy, and virtually independent of the crown. Eleanor, the heiress of William, last count of Poitou and duke of Aquitaine, married Louis VII., king of France, but being repudiated by him, she next married Henry, duke of Normandy, afterwards Henry II. of England, who thus became possessed of Guienne, Poitou, Gascony, Anjou, in short, of the whole Aquitania in its most extended sense. This was the origin of long wars between the two kingdoms. At last Charles VII. conquered Guienne and the other districts above-mentioned, and took Bordeaux in 1451-2, and reunited the whole to France. The name of Guienne continued after

wards to be used as that of one of the provinces of the old monarchy, though restricted to a very small portion of the former Aquitania, until the revolution, when the whole country was divided into departments, and the old denominations became obliterated.

ARA (the Altar), a southern constellation, not visible in our latitude. It is situated near Lupus, above Pavo and Triangulum Australe, in such manner that the Centaur appears to be placing the Wolf upon the Altar. One mythological account explains it as the altar upon which Chiron sacrificed a wolf; another, as an altar constructed by Vulcan, upon which the gods swore fidelity to each other during the war against the Titans.

ARA. (*Macrocerus*, VIRELLI.) [See MACAW.]

ARABESQUE. This term is applied to an heterogeneous species of ornament, or mode of enrichment on flat surfaces employed in works of architecture principally. The name is intended to mean simply 'in the Arabian manner,' and is a French form of that expression. The mode of enrichment which it refers to, was practised in the decoration of their structures by the Moors, Saracens, or Arabians of Spain, for they were called by all those names by their Christian but less civilized neighbours, and from them particularly the species of ornament to which it belongs was so designated. As far as the Mohammedan conquerors of Spain were concerned, they appear to have borrowed the idea from the hieroglyphical enrichments of the monuments of Egypt. The dogmas of their religious code, however, forbidding the representation of animals, in order to avoid the very semblance of idolatry, they employed plants and trees in a similar manner, and with stalks, stems, tendrils, foliage, flowers, and fruit, produced an endless variety of forms and combinations, with which they painted and sculptured the surfaces of their buildings. Hence fanciful combinations of natural objects to form the continuous ornament of a flat surface came to be called Arabesque, though it differed so widely from the Arabian or Mohammedan compositions as to be filled with representations of animals of every variety, and with combinations of plants and animals, as well as combinations of animal forms almost equally discordant with nature. The name, indeed, has become so general as to be applied to the fanciful enrichments found on the walls in the ruins of Herculaneum and Pompeii, as well as to others of the same and earlier date, which were formed and forgotten long before the sons of Ishmael learned to draw. The most celebrated Arabesques of modern times are those with which Raphael ornamented the piers and pilasters of the arched gallery of the palace of the Vatican, which bears his name. This gallery, or these galleries rather, for it is in three lengths, are always distinguished as Raphael's galleries ('Le Logge di Raffaello'), because of the Arabesques and of the illustrations of the Bible history in the ceilings, though, indeed, but one of the three sides exhibits the designs of the great artist himself.

The term Arabesque is more applied to painted than to sculptured ornament, though it is not restricted to the former; but Arabesque ornament in sculpture, if not kept very low in relief, is apt to become grotesque, as is the case with many or most of the sculptured enrichments of our painted architecture.

ARABIA. It is intended in the present article to offer a sketch of the prominent natural features of Arabia, and a brief survey of the history, state of cultivation, language, and literature of its inhabitants. Further information concerning particular points connected with each of these departments, will be found by turning to the separate articles, such as MECCA, KORAN, MOHAMMED, ABULFEDA, &c.

The entire surface of Arabia is calculated to be about

four times that of France. It is considered as pertaining to Asia, though, from its position and physical character, it would appear rather to belong to Africa. If the Red Sea did not interpose a narrow interruption, one almost continuous tract of sandy deserts would extend from the shores of the Atlantic to the Persian Gulf.

Arabia presents the form of a vast peninsula, connected with the south-western extremity of the continent of Asia by an isthmus of sandy deserts, the breadth of which, from the northern end of the Gulf of Akaba to the mouth of the Shatt-el-Arab (the Euphrates) in the Persian Gulf, may be estimated at about 800 English miles. It is situated between 12° and 30° N. lat., 32° and 59° E. long., partly within, and partly to the north of the tropical region: the tropic of Cancer divides it into two nearly equal parts. It is bounded on the N. by Syria and the Euphrates, on the E. by the Persian Gulf; the Indian Ocean (called here the Arabian Sea and the Sea of Oman) washes the long extent of its south-eastern coast; the straits of Bab-el-Mandeb and the Red Sea form the western boundary. Cape Rasalgate or Ras-al-Had is the most eastern projection of the peninsula; cape Mussendom (cape Maketa of the antients) extends in a north-easterly direction towards the straits of Ormuz; cape Aden, near the south-west angle of the peninsula, is discovered between fifteen and twenty leagues off at sea, as a steep and lofty rock; Bab-el-Mandeb, or the Gate of Tears, the dangerous passage from the Indian into the Red Sea, is the point of the peninsula which is situated farthest to the south-west; and cape Mohammed marks the projection of the Sinai mountains between the Gulfs of Suez and Akaba, the two northern branches or gulfs of the Red Sea.

The name Arabia, by which the Greeks introduced this vast country to the knowledge of Europeans, is derived from the name which has for ages been used by the inhabitants themselves. The word *arab*, as a collective noun in the singular, is used as the common name of the Arabic nation: its plural, *a'rāb*, is restricted to signify the wandering, nomadic tribes of the Arabs of the desert. Belād-el-Arab (*i. e.* the land of the Arabs), and Jezirat-el-Arab (*i. e.* the peninsula of the Arabs), are the usual native designations of the country: besides these, we may also notice the Persian appellation of Arabistān, by which name Arabia is often called among the Persians and Turks.

The derivation of the word Arab is doubtful. Pocock has adopted the notion of several oriental writers, that the country and its inhabitants were so named from Araba, a district in Yemen, to which Ya'rab, the son of Kahtan, the father of the antient Arabs, gave his name. But the real existence of an individual referred to by the name of Ya'rab, like that of several others of the primeval forefathers mentioned in the antient genealogies of the Arabs, appears to us subject to the same historical doubts, as that of many of the reputed founders of states in antient Greece. The very form of the name Ya'rab shows a peculiarity, observable also in other names that occur in the early genealogies of the Arabian tribes, which, in our opinion, characterizes it as a verbal derivative, formed at a subsequent period, in allusion to a former event, the remembrance of which might be preserved by tradition. We are inclined to trace the word *Arab* to the same verbal root, from which this name Ya'rab is evidently derived, namely to the Hebrew verb *arab*, 'to set or go down (as the sun).' According to this etymology, the name Arab implies 'the nation or country situated towards sunset,' *i. e.* westward from the Euphrates, and from the regions which were probably the earliest seats of the Semitic tribes. In support of this derivation, it may not be irrelevant here to observe, that in the Old as well as in the New Testament, by the names Arabia and Arabs, only small territories or isolated tribes in the northern part of what we now call Arabia appear to be meant. (See, *e. g.* Jerem. xxv. 24; Ezek. xxvii. 21; Galat. i. 17.) Others have deduced the name Arab from the Hebrew substantive *arābah*, 'a barren place or desert,' which, in several passages of the earliest parts of the Old Testament, is used as the designation of the dreary region east of the Jordan and the Dead Sea, and as far south as the Ælantic Gulf.

Greek and Roman Christian writers have confounded the Arabian tribes from Mecca to the Euphrates under the name of the Saracens, the import of which term, as appears from its etymology, (*shark*, in Arabic, 'the East,' *sharkī*, 'Eastern,') is 'Eastern Nations.' We do not hesitate to adopt this interpretation, notwithstanding the passage of

Ptolemy (pointed out by Gibbon), who expressly mentions the western and southern position of the Saracens.

The name of Arabia, in its proper acceptation, comprehends the peninsula as far as the isthmus, which runs from the northern extremity of the Gulf of Akaba to the mouth of the Shatt-el Arab. In a more extensive sense it is made to comprehend also a large tract north of the isthmus, reaching as far as the river Euphrates on the east, and the south-eastern angle of the Mediterranean on the west.

Some of the ancients have extended the limits of Arabia considerably to the north of the isthmus just defined. Pliny (*Nat. Hist.* v. 24) makes Arabia comprehend part of Mesopotamia, nearly as far as the frontiers of Armenia. Xenophon, in his personal narrative of the march of Cyrus the Younger [see ANABASIS], considers the sandy tract along the left bank of the Euphrates, and south of the tributary river Araxes (the Khabour), as part of Arabia; and the physical features of the country, of which he gives the following lively description, will, perhaps, justify him in assigning this tract to the division of Arabia. Having crossed the Araxes, Cyrus 'marched along through Arabia, having the Euphrates on his right for five days' journeys through the desert, a distance of thirty-five parasangs. In this region the soil was a plain, perfectly level like the sea, but full of absinthium: whatever else there was to be seen of brushwood or reed, was all fragrant like spices; yet no tree was found. There also was a variety of animals, among which wild asses were the most numerous, and not a small quantity of ostriches; there were also bustards and gazelles.'

The whole peninsula of Arabia, as far as it is at present explored, consists of an elevated table-land, declining on the north towards the Syrian desert, and encircled along the sea-coast with a belt of flat sandy ground. The flat country, beginning at Suez and extending round the whole peninsula to the mouth of the Shatt-el Arab, is called Gaur or Tehâma, i. e. the 'Low-land,' from which the mountainous region in the interior is distinguished by the appellation of Jabal, 'the Hills,' or Nejd, the 'High-land.' The width of the Tehâma varies: near Mokha its breadth is about one day's journey, near Hodeida and Loheia about twice as much. On the eastern coast, in the province of Oman, from Ras-al-Had up to Cape Mussendom, it is much narrower: between the villages of Sib and Sohar, indeed, its width extends to about a day's journey; but in the remaining part of the country, the hills reach almost to the sea.

The soil of the Tehâma, from its regular inclination towards the sea, as well as from the large beds of salt and marine exuvise with which it is interspersed, appears to have been once a part of the bed of the sea. It is observed that the sea on the western coast still continues to recede: the reefs of madrepore and coral which abound in the Arabian Gulf, and in some parts rise ten fathoms above the sea, are increasing and coming nearer the shore; and as the intermediate space is gradually filled up with sand, the Tehâma is on that side constantly extending its limits. Muza is mentioned by Arrian (*Periplus of the Erythraean Sea*, c. 5) as a sea-port of Arabia Felix; we now find it at a distance of several miles from the sea. The harbour of Jidda is described by Lord Valentia as being formed by innumerable reefs of coral, which extend to about four miles from the shore, leaving many narrow channels between, in which there is a good bottom at from six to twelve fathoms, and where the sea is perfectly smooth even when it blows the heaviest gale. In the southern part of the Arabian Gulf these banks of coral are less numerous.

The low-land of Arabia is occasionally for many years entirely destitute of rain; but sometimes it is scantily watered by the falling of slight showers during the months of March and April. The dews in the most arid tracts are said to be copious. The high-land has its regular rainy season, which begins about the middle of June, and continues till the end of September. Springs also abound in the loftier mountains, which, when fed by the copious annual rains, send streams of water through the valleys that descend towards the Tehâma: some of them are lost before they leave the mountainous region; others, which are more abundant, rush into the Tehâma, where the fertility of the soil mainly depends on irrigation. Most of the larger streams, as soon as they enter the burning plains, spread out into shallow lakes, and are lost in the sand; only a few reach the sea. These temporary currents of rain-water and the small verdant valleys, but a few feet below the general level, which intersect the arid Tehâma, consti-

tute an important and characteristic feature in the aspect of the country: they are called *wâdis*, an expression which we frequently meet with, though variously written, as a component part of the names of rivers generally, on the maps of other countries also into which Arabian settlers have penetrated. The adopted Greek word *oasis* or *oauris* appears to be the same as *wâdi*. The Wadi Zebid and Wadi Meitan are the two principal torrents in the territory of Yemen: the former reaches the sea near the town of Zebid on the Arabian Gulf; the latter, taking a southerly course, pours its waters into the Indian Sea. In the province of Oman, the river Masora and Wadi Sib contain water throughout the year, and both reach the Indian Sea. Arabia is entirely destitute of navigable rivers.

In the Tehâma, the heat during summer, owing to the want of rain, and the almost direct action of a tropical sun, is intense. Niebuhr states, that during his residence in the low-land of Yemen, in the month of August, the thermometer rose to 98° Fahrenheit, and at Loheia, during the month of January to 86°; at Sana, in the high-land, it only reached 85° during the summer, and Niebuhr heard it asserted, that, in the latter district, it sometimes freezes. At Muscat, the thermometer varies, according to Frazer, from 92° to 102° of Fahrenheit during summer. Niebuhr was struck with the delightful scenery of the coffee-mountains near Beit-el-Fakih, where he found the air much fresher and cooler than in the parched plains of the Tehâma: yet he had then scarcely reached half the ascent to Kusma and to the summit of the range of hills, which here forms the boundary between the Nejd and the Tehâma. The inhabitants of Yemen, he observes, are dwelling, as it were, in different zones; and within the limits of a comparatively small territory may be found a variety of indigenous species of the animal and vegetable kingdoms, such as in other countries can only be seen when brought together by man from distant regions.

The poisonous blasts known by the names of *sam*, *scum*, or *samiel*, seldom blow in the southern parts of Arabia. They are chiefly experienced in the tract between Basra, Bagdad, Haleb, and Mecca; but even here they are only dreaded during the hottest months of the year. These winds seem to derive their noxious qualities from passing over the great sandy desert when scorched by the intense rays of the tropical sun; and accordingly, Niebuhr was informed that at Mecca the samum blows from the east at Bagdad from the west, and at Basra from the north-west. The nature of winds generally seems to differ according to the tract which they have passed over. Ali Bey observes that, at Jidda, 'the north-wind, traversing the deserts, arrives in such a state of dryness, that the skin is parched, paper cracks as if it were in the mouth of an oven, and the air is always loaded with sand. If the wind changes to the south, everything is in the opposite extreme: the air is damp, everything that you handle feels of a clammy wetness, and the atmosphere appears to be loaded with a sort of fog.' Lord Valentia remarks, that the southern part of the Arabian Gulf, as far as the island of Jebel-Teir, opposite Loheia, is, during eight months of the year, exposed to the S.W. monsoon, which, as it blows over the arid sands of Africa, renders the climate of the adjacent coast extremely sultry. From Jebel-Teir to Jidda the winds are variable. Above Cosseir as far as Suez, the wind blows for rather more than eight months from the N.W.

Arabia has long been celebrated for the abundance of its odoriferous plants. The frankincense of Saba is alluded to by the Hebrew prophets (Isaiah lx. 6; Jeremiah vi. 20). Herodotus (iii. 107) mentions frankincense, myrrh, cassia, cinnamon, and ladanum, as productions exclusively peculiar to Arabia, though his information on the products of Arabia is neither extensive nor exact. Among the Romans also Arabian odours seem to have been quite proverbial. (*Precept.* ii. 22.)

The coffee-shrub is cultivated chiefly on the western descent of the chain of hills which, in the province of Yemen, separates the level country from the high-land: that grown at Bulgosa near Beit-el-Fakih, and exported from Mokha, still maintains its superiority over the coffee produced in the European colonies in all other parts of the globe. The frumaceous deposit called manna, familiar to all readers from the use made of it by the Israelites during their wanderings in the desert, is now, according to Niebuhr, chiefly, if not exclusively, found on the leaves of a species of oak called *ballôt* or *qaf*; according to others, it is a pellucid substance

exuded by the leaves of different kinds of trees, chiefly the *hedysarum alhagi* of Linnæus. Grapes are cultivated in several parts of Arabia, though in the Koran wine is forbidden to the Mussulmans. In Yemen, where some pains are bestowed upon agriculture, Niebuhr saw excellent wheat, Turkey corn, or maize, durra, barley, beans, lentils, tobacco, &c.; senna and the cotton-tree are also cultivated here. Much indigo is grown about Zebid. Niebuhr says that he saw no oats in Arabia: the horses are fed on barley, and the asses on beans. The time of the harvest varies. At Muscat, wheat and barley are sown in December and reaped in March; in the high-land, near Sana, the time of the harvest for barley is about the middle of July.

Arabia is rich in indigenous trees; the *acacia vera*, from which the gum Arabic is obtained, the date-tree, and many varieties of the palm and fig-tree deserve to be particularly noticed. Forests appear to be rare. In the barren tracts of the country, the Beduins sometimes supply the deficiency of fuel by the dried dung of the camel.

Among the antients, Arabia was celebrated for its wealth in precious metals; yet, according to the accounts of modern travellers, Arabia possesses at present no mines either of gold or silver. Iron mines are noticed by Niebuhr as existing in the territory of Saade. The lead mines of Oman are, according to him, very productive, and large quantities of lead are exported from Muscat.

On the sands of Arabia and Syria, the camel, the ship of the desert as it is emphatically called by the natives, is an invaluable treasure. Like the Beduins themselves, it learns from early youth to endure hunger, thirst, and fatigue. It performs journeys of 300 to 400 hours without requiring to drink oftener than once in eight or ten days. The herbage scantily supplied by the desert is sufficient for its food. It carries a weight of a thousand pounds and upwards, without being unloaded for weeks. A hint from its leader directs its motions; a song renews its strength. Its hair is manufactured into cloth for garments and tents; its milk, like that of the cow, is nutritious and sweet; its flesh, when young, is in taste similar to veal.

Arabia is noted for its horses, of which there are two distinct breeds. The one, which is called *kadishi*, i. e. of unknown descent, is in no higher estimation than the common horses in Europe; horses of this breed are employed to carry loads, or as draught-animals. The other, called *koheili* or *kohlani*, i. e. of antient and noble pedigree, is reserved for riding only. The best horses are bred in the desert bordering on Syria: they are here educated in the encampments of the Beduins with a careful tenderness which trains them to habits of attachment to their masters. It is for this quality, and for their amazing speed, that they are valued, more than for their size or beauty.

There is also in Arabia a spirited kind of ass, which is used for riding and for military service; the best are to be found in the province of Lahsa. The Arabian oxen and cows are distinguished by a hump over the shoulders. Herodotus (iii. 113) mentions two kinds of sheep with fat tails as being indigenous in Arabia. The rock goat, the fox, the musk-deer, and a wild species of ass inhabit the hill-country. The jackal, the wolf, the hyæna, and the panther, roam around the tents of the Beduins, or follow the track of the caravans through the solitary desert. The gazelle seeks pasture and shade in the isolated *wadis*. The woods of Yemen and Aden are inhabited by troops of monkeys. The lion, from the frequent allusions to it in antient Arabic poetry, and from the number of names which the language has for it, must at one period have been very common.

Among the birds indigenous in Arabia, we find mentioned several large birds of prey, such as the eagle, the vulture, and several kinds of hawk. The carrion-vulture frequents battle-fields and performs the services of scavenger. The ostrich and other birds valued for their plumage live in the deserts. Tame fowls, pheasants, and different sorts of pigeon, are frequent in Yemen. Along the coast of the Red Sea, pelicans and various kinds of sea-fowl are found.

The locusts of Arabia, whose devastations are so often alluded to, are dried, and roasted or boiled, and in this state eaten by the Arabs. Niebuhr states that they are strung on threads and offered for sale in the markets of all the Arabian towns from Bab-el-Mandeb to Basra.

The sea, on the eastern coast of Oman, is so abundant in fish, that not only asses, cows, and other domestic animals are fed with them, but they are also spread on the fields, to

improve the soil, as manure. The pearl-fisheries of the Persian Gulf are universally celebrated. The bank on which pearl-shells are principally found extends from the Bahrein islands to very near the promontory of Julfar. The northern extremity, near the isles Kerek and Bahrein, is distinguished as particularly rich in pearls. The pearl-fisheries in this part of the Persian Gulf are alluded to by Arrian.—(*Periplus Mar. Rubi*, c. 9.)

Divisions of Arabia.—Arabia has been variously divided at different times, and by different authors. Strabo (xvi. c. 4.) divides the whole country into the Happy and the Desert Arabia, the former occupying the southern, and the latter the northern part of the peninsula. The triple division into Arabia Felix, Arabia Petræa, and Arabia Deserta, was introduced by Ptolemy: *Arabia Felix* he called the peninsula, as far as the isthmus already described; *Arabia Petræa*, so named from Petra, the ancient capital of the Nabathæans, was the country between the Red and the Dead Sea, bordering upon Palestine and Egypt; and *Arabia Deserta* comprehended the whole extent of the Syrian desert, as far as the Euphrates, where we find Palmyra.

By some contemporary Christian writers on the history of the Crusades, the territory around Bostra, or the Auranitis of the antients, is called *Arabia Prima*; the country east of the Jordan had the name of *Arabia Secunda* or *Arabia Petræensis* (in allusion to its capital Krak or Karkak, also named Petra Deserti, which was erroneously supposed to stand on the spot of the antient Petra of the Nabathæans); the country around Shaubek (Shobak) or Montroyal (Mons Regalis) was called *Arabia Tertia*, also *Syria Sohal*, or *Terra Montis Regalis*. Oriental writers generally enumerate five provinces of Arabia, viz., Yemen, Hejaz, Tehâma, Nejd, and Yemâma; some add Bahrein as a sixth, while others consider this as part of Irak Arabi. The three provinces, Tehâma, Nejd, and Yemâma, are by some considered as subdivisions of Hejaz. Arabia Petræa, including Mount Sinai, is by most of them considered as belonging partly to Egypt and partly to Syria; and the northern part of Arabia Deserta is generally called the desert of Syria.

The following outline of the present division of Arabia is founded chiefly on that adopted by Niebuhr.

1. *Yemen*, bordering upon the Red Sea, and upon the territories of Hejaz, Nejd, and Hadramaut. It is subdivided, according to Niebuhr, into fourteen independent provinces, the principal of which are the following:—

1. Yemen Proper, with the towns of Sana, in the mountainous district towards the high-land, the residence of the Imam of Yemen; Mokha, on the borders of the Red Sea, now the principal sea-port of Arabia; Zebid, Beit-el-Fakih, Hodeida, and Loheia, in the flat country along the coast of the Arabian Gulf.

2. Aden, with the celebrated antient town and harbour of the same name, situated at the foot of high mountains which surround it on almost every side, and leave only one very narrow causeway by which the town can be approached on the land side. Aden was, during the twelfth, thirteenth, and fourteenth century, an important emporium in the European trade with India, which has since been transferred to Mokha. [See ADEN, ALBUQUERQUE.]

3. The principality of Kaukeban.

4. Belad-el-Kobail, an extensive mountainous district towards the north of Yemen Proper, the princes of which have maintained themselves independent of the Imams of Sana.

5. Abu Arish, with the mercantile town of Jazan on the Red Sea.

6. Two small territories called Khaulan, the one to the south-east of Sana, the other on the road from that town to Mecca.

7. Sahan, a large district in the hills between Belad-el-Kobail and Hejaz, mostly inhabited by independent Beduins.

8. Nejran, a pleasant and fertile country, rich in water, with excellent pastures, and famous for its camels and horses: its capital, Nejran, is by some supposed to be the Nagara of Ptolemy.

9. Jauf or Jof, a territory extending to a great distance over the Arabian high-land, to the east of Belad-el-Kobail, with the antient Mareb or Mariaba, the capital of the Sabæans.

10. Yafa, situated between Jof, Hadramaut, and Yemen Proper.

11. *Hadramaut*, a country once famous for its trade.

chiefly in frankincense, is bounded on the south-east by the Indian Ocean, on the north-east by Oman, on the north by the Arabian high-land, and on the west by Yemen. The trade with Oman and Yemen is carried on by sea; Dabar and Keshin are the principal harbours. Part of the country is occupied by independent Beduin chiefs, among whom the sheikh of Shibam is the most powerful. The island of Socotora or Socatra, famous for the aloe which it produces, was, at the time of Niebuhr's visit, subject to the chief of Keshin.

III. *Oman* extends along the coast of the Persian Gulf and the Indian Sea, and borders, on the west and south, on the great elevated desert which fills the interior of Arabia. The country is in some parts fertile in wheat, barley, Turkey corn, lentils, grapes, dates, and garden fruits; it also has lead and copper-mines. Rostak is the residence of the Imam of Oman. The harbour of Muscat is important as an emporium.

IV. *Independent States on the islands and borders of the Persian Gulf.*—Almost all the sea-ports in the Persian Gulf, occasionally even some on the Persian coast, are in the possession of Arabic tribes, who for the most part depend on navigation, fishery, and diving for pearls, for their livelihood. Dates, durra-bread, and fish, are their principal articles of food. Each little town has its own sheikh. In time of war, all their fishing-boats are made battle-ships; and as with a navy of this description decisive battles cannot easily take place, the internal contests between the little states continue almost without an interruption. When a Persian army is sent against them, they leave their settlements on the coast, where they have but little to lose, and retire in their boats to some uninhabited island till the troops are withdrawn. Gombroon, or Bender-Abbas, and Abusheher, or Bushire, are the principal sea-ports on the Persian coast. The island of Kharej, or Karek, in the northern part of the gulf, nearly opposite Abusheher, is, through its situation, an important station for eastern commerce. The little island of Hormuz, or Ormuz, in the straits which form the entrance from the Indian Sea into the Persian Gulf, is celebrated from the importance which it possessed while the Portuguese trade with India was flourishing. At no very great distance from Ormuz is situated the large island called Kishme, or Loft, by the Europeans, and Tawile, or Derâz, by the Arabs and Persians. The island, or rather the group of islands called Bahrein, near the western coast of the Persian Gulf, is celebrated for its pearl-fishery. It is said to have been very populous formerly, and to have contained upwards of three hundred and fifty towns and villages. The principal island of the group is known by the name of Awâl. The ancient harbour of Gerra is supposed to have been somewhere on the opposite coast of Arabia. (See Strabo, xvi. c. 4, p. 776, Casaub.)

V. The country of *Lahsa*, or *Hajar*, lies along the western shore of the Persian Gulf; the part immediately along the coast is sometimes called Bahrein. It borders on the south on Oman, on the west on the Arabian high-land, and on the north on the territory of the Beduin tribe Kaab, near the Shatt-el-Arab. The greater part of the country towards the interior is occupied by Beduins; the inhabitants along the coast subsist chiefly by the pearl-fishery, or the cultivation of date-trees. The principal towns are Lahsa, the residence of the sheikh, and Katif, a sea-port opposite the Bahrein islands, perhaps near the ancient Gerra.

VI. The country of *Nejd* occupies nearly the whole extent of the high-land of Arabia, from Yemen and Hadramaut in the south to the Syrian desert on the north and from Hejaz in the west to Lalisa and Irak Arabi on the east. It is inhabited almost exclusively by wandering tribes of Beduins. The hilly tracts are fertile, chiefly in dates; but rivers, and even the temporary *wadis*, are scarce, and to obtain water deep wells must be dug. The greater part of the country consists of arid deserts. The climate is excessively hot, but the air is pure and salubrious. Besides the moveable tents of the nomadic Arabs, the traveller meets with a number of small villages, irregularly built, but populous, and agreeably situated on the declivities of hills, or in the midst of verdant valleys.

The country of Nejd is at present subject to the Wahhabites, a religious sect, which not long ago threatened by its rapid progress to overthrow the whole Mohammedan community. The founder of this fanatic sect was Abd-al-Wahhâb, a native of Nejd, who lived several years at Basra, and, after visiting Bagdad and Persia, returned to

his native country. Here he began to promulgate his religious opinions, which were soon embraced by many of the independent Beduin chiefs. We are still without an authentic and detailed account of the doctrine of Abd-al-Wahhâb; its main tendency seems to be, to reduce the Mussulman faith to a pure deism, by representing Mohammed and his predecessors, Moses, Jesus, &c. not as inspired prophets, but only as enlightened and benevolent men. The capital of the Wahhabite dominion, and the principal city of the whole Arabian high-land, is Dereiye, a town of about 2500 houses, picturesquely situated along the borders of the Wâdi Hanifa. This valley, extending itself from west to east, is several hundred English miles in length, and about one and a half in breadth: during part of the year it is watered by a torrent of rain from the mountains; during summer, the want of irrigation is supplied from the copious wells of the surrounding country. Dereiye has twenty-eight mosques, (but, contrary to the Mussulman fashion, without minarets and cupolas,) and thirty schools, in which the children receive instruction twice every day, except Fridays. The gardens and fields around Dereiye are fertile in dates, pomegranate-trees, apricots, peaches, grapes, melons, &c., also in wheat, barley, and millet. [See Rousseau, in the *Mines de l'Orient*, II., p. 155, &c.]

VII. *Hejaz* borders on the east on Nejd, on the north on the Syrian desert and the Gulf of Akaba, on the west on the Red Sea, and on the south on Yemen. It is the holy land of the Mohammedans, on account of the two sacred cities Mecca and Medina, the former the native town of Mohammed, the latter the place where he is interred. As long as the Grand Signior of Constantinople, in his character of Protector of the Holy Places, maintained his sovereignty over this important province, he used regularly to appoint a pasha, who resided in the citadel of Jidda, the sea-port of Mecca, with a Turkish guard, and divided the receipts of the custom-house with the sheriff of Mecca, who was considered as his vassal. The dominion of the Grand Signior was, however, little more than nominal, and the sheriff might very easily have made himself independent long ago, if the existing relations with Constantinople had not been advantageous to the Hejaz, on account of the rich presents annually sent from the Turkish capital to the sanctuary of Mecca, in which all the descendants of the prophet's family throughout the Hejaz, and almost every inhabitant of the town, were allowed, as servants attached to the temple, to participate. But when the power of the Porte in the African and Asiatic provinces became weakened, and when the increasing ascendancy of the Wahhabites cut off the communication between Constantinople and the sacred cities, the sheriff of Mecca became disinclined to remain tributary to the sultan. Disputes and open hostilities followed: the sheriff attacked the Turkish pasha at Jidda, destroyed his citadel, and got rid of him by poison. Soon, however, the sheriff found himself besieged by the Wahhabites; and the caravans of pilgrims, which annually proceed from all Mohammedan countries to Mecca, were frequently intercepted and exposed to constant annoyance from the followers of the new religion. Mohammed Ali, the present viceroy of Egypt, at length succeeded in checking the power of the Wahhabites, he made himself master of the Hejaz, and assumed the protectorship of the holy towns.

'The number of pilgrims,' says Niebuhr, 'who annually assemble at Mecca is very great. One great caravan comes from Damascus, consisting chiefly of pilgrims from the Turkish empire. Another, coming from Egypt, brings along the Mogrebi or African pilgrims: both meet at a few days' distance from Mecca. Another caravan arrives from Bagdad, with which most of the Persian pilgrims travel. Two smaller caravans come from Lahsa and Oman, besides a separate company of pilgrims from Yemen, and numberless smaller crowds which arrive direct by sea from Persia, the southern and eastern parts of Arabia and the adjacent islands, from India, the Arabian colonies on the west coast of Africa, &c. Only a few pious Mohammedans perform the pilgrimage out of real devotion, and at their own expense: most of the pilgrims undertake the tour with a view to profit. Some accompany the caravan as soldiers, and are remunerated for the protection which they afford to the pilgrims against the attacks of the warlike Beduins: some are pilgrims by profession, and are paid to perform the sacred journey for others, who are prevented from discharging the religious duty personally.'

The principal towns of the Hejaz (Mecca, Medina, Jidda)

have already been alluded to. Besides these, we may mention Yanbo, the sea-port of Medina; Tayef, which is agreeably situated upon a lofty eminence, and supplies Jidda and Mecca with excellent fruits; Ghunfude, and Hali.

VIII. *The desert of Mount Sinai*, including the Arabia Petrea of the antients, once the seat of the Nabathæan dominion, is now nearly desolate, and contains but few towns; the open country is entirely in the hands of the independent Beduins. The group of the Sinai mountains is the last considerable elevation towards the north-west of the mountains which form the high-land in the interior of Arabia. It nearly fills a peninsula projecting into the Red Sea, having the Gulf of Akaba on the east, and that of Suez, called also the Gulf of Kolzum, on the west. At the northern extremity of the eastern gulf is situated the antient town of Aila, the Elath of Scripture (Deut. ii. 8; 1 Kings ix. 26; 2 Kings xvi. 6), now commonly called Akaba. At the northern extremity of the western gulf lies the town of Suez, one of the few safe and spacious harbours in the Red Sea where ships can be repaired: it is now of secondary importance, as the traffic by sea between Egypt and the Hejaz is chiefly carried on from Kosseir; yet the trade in coffee and Indian goods still passes by Suez to Kairo. On the eastern side of the gulf of Suez is another good harbour called Bender-Tor, where the ships trading between Jidda and Suez are in the habit of anchoring to take in fresh water, which the neighbouring mountains supply of excellent quality. In the Sinai mountains we find sandstone, and on the highest parts granite. In the midst of the hills, on the height of Jebel Musa, surrounded by higher mountain-tops, and near the summit considered as the proper Sinai of Scripture, is situated the convent of St. Catherine, founded, according to the credited tradition, by Helena, the mother of Constantine, in the fourth century. Jebel Musa is rich in springs of fresh water; the surrounding valleys produce excellent grapes, pears, dates, and other fruits, quantities of which are brought for sale to Kairo. Wadi Faran, or Feiran, with its continuation Wadi-el-Sheikh, and Wadi Giroadel, both to the north of Jebel Musa, and sloping towards the gulf of Suez, are filled with water during the rainy season, which obliges the inhabitants then to retire up the hills.

Towards the north of the group of Sinai is a desolate tract, called by the Arabs El-Ti, or Tiah-Bani-Israïl, i.e. the desert of the children of Israel. Abulfeda (*Descript. Egypti*, p. 14, ed. Michaelis) states its dimensions from nearsary at forty parasangs in length, and as much in breadth, the soil being partly rocky and hard, and partly sandy, with now and then a well of brackish water. This account is fully confirmed by Burckhardt, who describes it as the most dreary and barren wilderness that he ever met with.

To the north of the Gulf of Akaba, in the hilly district of Jebel Shera, at a distance of about seven hours from Shobak, or Kerek-al-Shobak, its capital, the Wadi Musn opens itself, watered by the copious spring of Ain Musa. In this valley, below the village of Eldjy, Burckhardt discovered the magnificent ruins of a town which he, no doubt correctly, supposed to be the antient Nabathæan capital Petra. 'The metropolis of the Nabathæi,' says Strabo, (book xvi., c. 4, p. 403, ed. Tauchnitz; Casaub. p. 779.) 'is a town called Petra. It is situated in a place which itself is smooth and level, but which is all around fenced by a circle of rocks, and on the outside consists of precipitous cliffs, while towards the interior it has copious springs for the watering of fields and for horticulture.' Pliny (N. H. vi., c. 28) describes Petra as situated 'in a valley somewhat less than two thousand paces wide, inclosed by inaccessible mountains, with a stream running through it.'

IX. *Tribes of Beduins, or Wandering Arabs*.—The word *Beduin* is a corruption of the Arabic *badwi*, which is derived from the substantive *badw*, 'an open country, a desert,' and signifies an inhabitant of the desert. The Arabs who live in towns, Niebuhr observes, especially those near the seacoast, have through their commerce had so much intercourse with strangers, that they have lost much of their antient manners and customs. But the true Arabs, who have always valued their freedom higher than wealth and luxury, live in detached tribes under tents, and still adhere to the primitive form of government, habits, and usages of their ancestors. Their nobles they call sheikhs. A sheikh rules over his family, and all their servants. If they are unable separately to defend their property against a hostile neighbour, several petty sheikhs unite, and choose a chief from among themselves. Several chiefs, with the assent of the

petty sheikhs, submit to one still more powerful, who is called sheikh-al-kebir, or sheikh-al-shoyukh, and the entire body of united tribes is then named after the family of this supreme sheikh. The Beduins are all, as it were, born soldiers, while at the same time they attend to their cattle. The sheikhs of the great tribes have a large number of camels, partly for use in time of war, partly to transport the goods of merchants from one town to another, and partly for sale. The smaller tribes, which are less wealthy and independent, principally tend sheep. Agriculture, and other descriptions of hard work, they commit to their subjects, the common Arabs, who live in miserable huts; the sheikhs live under tents. Being accustomed to an atmosphere of great purity, the scent of these Arabs of the desert is uncommonly nice. It is said, they are able to live for five days without drinking. The government remains in the family of every greater or smaller sheikh: among the sons or nearest relations, not the eldest, but he who appears the best fitted, is chosen. They pay little or nothing in the way of taxes to their superiors. Every little sheikh is not only the protector, but also the leader of his family; he is, accordingly, looked upon by the greater sheikh rather as a confederate, than as a subject. If one of the little sheikhs is dissatisfied with his sheikh-al-kebir, and is nevertheless unable to depose him, he will remove with his cattle to another tribe, which is usually glad to strengthen its party. Every sheikh, however small he may be, must therefore endeavour to govern his tribe well, for fear of being deposed or deserted. The names of many tribes, once possessing great power, have thus fallen into oblivion; and small families, unknown before, have raised themselves to importance.

The Beduins have never been subjugated by foreign conquerors: only a few tribes who live near the large towns of Bagdad, Mosul, Orfa, Damascus, and Aleppo, are in some degree subject or tributary to the Grand Seignior. The several tribes are often at war with one another; but their conflicts are neither of long duration nor sanguinary. Whenever any tribe is attacked by a foreign enemy, all the neighbouring chiefs will unite in defence of the common cause. Every sheikh considers himself as sovereign in his territory, and therefore entitled to exact a tribute from travellers passing through it. The Turkish sultans even used to engage themselves to pay annually a fixed sum of money, besides a number of garments, to the Beduin tribes on the road to Mecca, for not destroying the wells along the way, and for conducting the pilgrims through their respective territories. Nevertheless, disputes frequently arose between the sheikhs and the haughty Turkish leaders of the caravans, in consequence of which the pilgrims were often attacked and plundered.

The sheikhs are daily mounted on horseback or on their dromedaries, to inspect their subjects, to visit friends, or to enjoy the pleasures of the chase. The horizon in the desert is nearly as open as at sea. If a Beduin sees a solitary wanderer from afar, he rides towards him, and orders him to undress. In such cases, the Beduins are real robbers; yet it would be incorrect to say that they live chiefly from robbery. They seldom kill those whom they plunder, provided no resistance is offered; the robber is sometimes even kind and hospitable to the forlorn traveller whom he has plundered, furnishing him with provisions and old clothes in exchange for his own, and conducting him part of his way, that he may not perish in the desert.

The tents of the Beduins are made of a coarse kind of dark coloured cloth, woven by their own women, which is drawn over seven or nine poles fixed upright in the ground, the middlemost being the highest. The larger tents consist of two or three compartments, so as to have separate rooms for the men and women, and for the domestic animals. The poor, who cannot afford the expense of a regular tent, spread a piece of cloth, as large as they can get, near a tree, or take shelter in the caves of rocks from heat or rain. There is but little furniture in a Beduin tent: a mat of straw is used as table, chairs, and bedstead; spare clothes are kept in bags. The kitchen apparatus is very simple and portable. The pots are made of copper lined with tin: the dishes of the same metals, or of wood. Their hearth is easily built, they merely place their cauldrons on loose stones, or over a pit dug in the ground. They have neither spoons, nor knives and forks. A round piece of leather serves them as table-cloth, in which the remains of the meal are preserved. Their butter, which the heat soon melts down, they keep in leather bottles. Water is kept in goats'

skins: a copper cup, carefully tinned over, serves as a drinking-vessel. Wind-mills and water-mills are unknown; all grain is ground in a small hand-mill. There are also no ovens in the desert: the dough is either kneaded into a flat cake, and baked on a round iron plate, or it is formed into large lumps, which are laid between glowing coals till they are sufficiently baked. Among the great sheikhs of the desert, who require nothing but pilau—i.e. boiled rice—for their meals, a large wooden dish full is served up, around which one party after another sits down, till the dish is emptied, or all are satisfied. (*Niebuhr, Beschreibung von Arabien*, p. 379, &c.; also *Reise nach Arabien*, vol. i., p. 233.)

Ancient Arabia, as known to the western nations.—The history of antiquity is not without traces of an early influence of the Arabs on the condition of neighbouring nations. The book of Genesis (x. 10) mentions Nimrod as the founder of the Babylonian empire—'And the beginning of his kingdom was Babel and Erech, and Accad and Calneh, in the land of Shinar.' We think we recognize in Nimrod, the mighty hunter, an Arabian chieftain, like the modern sheikhs of the Beduins: in the passage quoted from the Hebrew, Erech is, according to several of the ancient versions, the modern Orfa (Edessa); Accad is supposed to be Nisibis, in Mesopotamia; and Calneh to correspond to the situation of Ctesiphon on the Tigris.

Egypt seems at an early period to have been infested by invasions from Arabia; for we cannot hesitate to consider the Hyksos as predatory Arabian tribes. They are said to have occupied the Delta, and even to have penetrated as far as Memphis: the king of Thebes, Thutmosis, at last succeeded in expelling them. Their dominion over Egypt is said to have lasted 284 years—it is supposed from the eighteenth till the sixteenth century before the Christian æra. Sesostris is said to have built a wall, 1500 stadia long, from Pelusium to Heliopolis, to protect Egypt from a repetition of such invasions; but this story about the wall is open to several serious objections.

Among the nomadic tribes in the northern tracts of Arabia, the Midianites seem to have early applied themselves to traffic with the neighbouring nations. It was a caravan of Midianite merchants to whom Joseph was sold (Gen. xxxvii. 28, 36). Arabia was the country of frankincense; and so essential a requisite of religious worship in all the temples of antiquity would soon give great importance to the trade of foreign countries with Arabia. Gerra, probably situated near the present El Katif or Lahsa, was, according to Strabo, a Babylonian colony, founded by Chaldean emigrants. The exact period of its foundation is unknown; but the companions of Alexander the Great found it as an opulent town (Strabo, xvi. c. 3. p. 766, Casaub.), and it must have been long prospering as an emporium. The advantages for an extensive commerce by land and by sea, possessed by a harbour thus situated on the spacious Persian Gulf, are striking. From Gerra the productions of both Arabia and India were shipped to Babylon, and farther up the Euphrates to Thapsacus, whence they spread by land all over western Asia.

Considerable variety of opinion prevails concerning the situation of Ophir, the country whence the ships of Solomon, conjointly with those of the Phœnicians, brought gold, silver, gems, sandalwood, and other precious articles (1 Kings ix. 28; x. ii. 22). Bochart, Reland, and other critics sought it in India. Modern historians are inclined to think that it was situated in Arabia. The name is, in the book of Genesis (x. 29), enumerated among Arabian tribes descended from Joctan, and a town named El-Ofir has recently been found on the coast of Oman. (*Bohlen's Indien*, ii. p. 137.)

In the history of ancient commerce generally, Arabia is of importance not only on account of the export of its own productions, but also as an intermediate station in the trade with India. Herodotus (iii. 107) calls Arabia the only country where frankincense, myrrh, cassia, and ladanum are to be found: Strabo (xiv. c. 4, tom. 3. p. 385, ed. Tauchnitz) mentions the province of Cattabania in particular as the country of frankincense, and Chatramotitis (Hadramaut) as that of myrrh. Gold and precious stones are also often alluded to by the ancients as indigenous productions of Arabia Felix. Gold-mines are not at present known to exist: some precious stones, such as the onyx, the ruby, and a kind of agate called the Mokha-stone, are common in Yemen and Hadramaut. In enumerating cinnamon among the productions of Arabia, Herodotus probably confounded the real productions of the country with the other foreign articles, which, like

ivory and ebony, the western nations might procure from Arabian emporia.

Antiquity abounds in proofs of the early trade of the Phœnicians with India, which must in a great measure have been carried on through Arabia. One of the earliest and most important allusions to this mercantile intercourse of the Phœnicians with several towns or countries and tribes of Arabia, occurs in the elegy of the prophet Ezekiel on the fall of Tyre. We insert a literal translation of the passage, leaving the proper names in their Hebrew form, and subjoining to each, between parentheses, the probable modern or classical equivalent.

Ezek. xxvii. 12. 'Tarshish (Tartessus) was thy (Tyre's) customer, on account of the variety of all [thy] treasures: silver, iron, tin (*bedil* ?), and lead did they (the merchants from Tarshish) place on thy markets.

13. Yavan (Greece), Thubal (the Tibareni in Pontus), and Meshech (the Moschi between Armenia, Iberia, and Colchis) dealt with thee: souls of men (slaves), and copper vessels did they bring on thy markets.

14. Those from the house of Thogarma (Armenia) brought on thy markets horses for draught and horses for war, and mules.

15. The sons of Dedan (according to Bochart, a town on the Persian Gulf; according to Heeren, one of the Bahre islands; why should it not be here, as elsewhere, the tribe in the neighbourhood of Idumea?) dealt with thee; many islands transacted business with thee: with ivory and ebony did they repay thy gifts.

16. Aram (Syria) was thy customer on account of the variety of thy manufacture: [in exchange] for gems, and red purple, and embroidery, and byssus, and corals, and crystal [which Aram brought] on thy markets.

17. Juda and the land of Israel dealt with thee: wheat of Minnith (a town in the land of the Ammonites), and sweetmeats, and honey, and oil, and balsam did they place on thy markets.

18. Damesek (Damascus) was thy customer, on account of the variety of thy manufactures, and on account of the variety of all [thy] treasures: [in exchange] for wine from Chelbon (Haleb, Aleppo) and shining wool [which Damesek brought in return].

19. Vedan and Yavan (both here Arabian towns or tribes not yet ascertained) brought weavings on thy markets: wrought iron, cassia, and calamus hadst thou for sale.

20. Dedan (a tribe in the neighbourhood of Idumea) dealt with thee in carpets that are spread to sit upon.

21. Arab (Arabia) and all the chiefs of Kedar (the Arabes Cedreni of Pliny) were transacting business with thee: they were thy customers with their lambs and rams and goats.

22. The tradesmen of Sheba (Sabæa in Arabia Felix, and of Raëma (the Rhagma of Ptolemy, on the Persian Gulf) dealt with thee: the choicest of all spices, and all [sorts of] precious stones, and gold did they bring on thy markets.

23. Haran (Carrhæ, the modern Harran in Mesopotamia) and Canneh (= Calneh, i.e. Ctesiphon?) and Eden (probably the Ma'adan of Syrian writers, in the province of Diarbekir, the tradesmen of Sheba (Sabæa), Ashur (Assyria), and Kilmad (not yet ascertained) dealt with thee.

24. They dealt with thee in rich garments, in crimson and variegated cloth, and in chests full of many-coloured weavings, tied with ropes, and firm, [which they brought on thy markets.]

Professor Heeren, in his valuable work on ancient commerce, (*Ideen*, &c. vol. i. part ii. p. 102, &c., fourth ed.) has adopted the interpretation of J. D. Michaelis, according to which, by the first three names in verse 23, three great Arabian harbours on the coast of the Indian Sea are to be understood. This we think improbable, since almost all the other names which can be traced with some degree of certainty belong to northern countries; besides the special evidence in favour of the identity of at least Haran with Carrhæ. To arrive at a precise conclusion as to the exact import of many of the names mentioned by the Hebrew writer, is perhaps the more hopeless, as it is clear enough, from the context, that the Phœnician merchants (in the same manner as the Nabathæans afterwards) did not resort to the places personally, but received their goods from thence by foreign caravans: thus the name and situation of the countries whence the several articles came would be less attended to than if the case had been the reverse.

Besides this caravan trade with the Phœnicians, the inter-

course of the antient Arabs with the western world seems to have been but scanty; and, accordingly, the accounts of Arabia given by the classical writers are imperfect. The intrepid valour of the Arabs was proverbial among the Greeks and Romans. The body of the nation has escaped the dominion of the most powerful monarchies that have arisen and fallen in its immediate neighbourhood. Of the antient Persian empire, Herodotus (ii. 88.) expressly mentions, that all nations of (western) Asia were subject to Darius Hystaspis, except the Arabs, who were the independent confederates of the Persians: and when Cambyses had formed the design of invading Egypt, he was obliged to seek the friendship of some Arabs, who engaged to supply the Persian army with water during its march through the sands of Arabia Petræa. (Herodot. iii. 7-9.) If Phul, the conqueror of the new Assyrian empire, is said to have subdued the Arabs, or if Sanherib is called the ruler of Assyria and Arabia, this can only be understood as applying to the northern tribes of Arabia.

Alexander the Great is said to have contemplated the circumnavigation of Arabia and the subjection of its predatory hordes. The fleet of Nearchus was preparing to make the circuit of the peninsula, when the death of Alexander prevented the execution of the design.

The Nabathæi (*Nebathoi*, Gen. xxv. 13; xxviii. 9; Isa. lx. 7) inhabited, according to Diodorus (ii. 48), the north eastern part of Arabia, which was subsequently, in allusion to the name of their capital Petra, called Arabia Petræa. Diodorus describes them as a valiant nation, safe in their deserts as in an asylum, where none but themselves knew the springs of water. Like other Beduin tribes, they subsisted in a great measure by predatory excursions: but they seem at an earlier age than their neighbours to have applied themselves to an independent traffic, and in consequence also to other occupations of peace. 'Some of them,' says Diodorus, 'make it their business to transport to the Mediterranean frankincense, myrrh, and other spices, which they obtain from those that bring them from Arabia Felix.' Their territory was repeatedly invaded by the states arising out of the Macedonian empire. Demetrius, the son of Antigonus, and afterwards Antiochus the Great (224-187 .c.), attacked them without success. The Nabathæans maintained their independence, and their trade flourished even more than previously. After Syria had become a Roman province (64 B.C.), its governors Scaurus and Labrius repeatedly threatened Petra with an invasion. In the reign of Augustus, Ailius Gallus is recorded to have conducted an expedition into Arabia Felix, in which Abodas, then king of Petra, assisted him with a thousand Nabathæan Arabs. The Roman army landed at Leukoma (Yanbo), and after a fatiguing march of several months reached Marsyabæ (Strab. xvi. c. 4, p. 407, Tauchitz), the capital of the Sabæans. But want of provisions, and the bad effects of the climate, compelled the invaders to speedy retreat to the coast, and over the Red Sea to Egypt. It is to this expedition that Propertius (ii. 8) alludes in the lines:

India quia, Auguste, tuo dat colla triumpho,
et domus intactæ te tremat Arabiæ.'

In the reign of Trajanus, Arabia Petræa became, through the victory of A. Cornelius Palma, a Roman province (A.D. 97), and the northern countries, towards the east of the river Jordan, formerly in the possession of the Nabathæans, continued to be subject to the Romans even after the death of Trajanus. A Roman legion was stationed at Bostra, and the Emperor Philippus, who was born here, hence received the surname of *Arabs*. Petra sunk into insignificance: its inhabitants deserted it, and sought the freedom of their deserts; even the place where it had flourished was forgotten; till, in our own time, Burckhardt discovered the ruins of Wadi Musa.

History of the Arabs.—Of the internal history of Arabia before Mohammed, our knowledge is very imperfect. Prior to the beginning of the third century of the Christian æra, all that has been transmitted to us by Arabic writers amounts only to some genealogies or lists of kings, without any fixed chronology, and interspersed with but a few facts unsatisfactorily recorded.

The Arabians are, by their own writers, (Abulfaraj, *Hist. Dynast.* p. 100) distinguished into two classes, the old and the modern tribes. As belonging to the old Arabians, which are now entirely extinct, we find enumerated the tribes of Ad, Thamud, Tasm, Jadis, the (antient) tribe of Jorham, and Amalek. The names of these tribes now only survive

in vague traditions. thus Sheddad, of the tribe of Ad, is said to have founded the magnificent city and the delicious garden of Irem, which are often alluded to in eastern poetry, and fancied by some to be still extant, though now miraculously hidden from view in impassable deserts. The present or modern Arabians are, by their own historians, divided into pure or genuine, and insidious or naturalized Arabs. The former date their origin from Kahtan (the Yoktan of the Old Testament, Gen. x. 28), and the latter from Adnan, a descendant of Ismael, the son of Abraham and Hagar. These Ismaelide Arabs seem to have settled chiefly in Hejaz; while the southern part of the peninsula received its inhabitants through the Kahtanides or Yoktanides. Kahtan's son was Ya'rab, who was the father of Yash'ab; the son of Yash'ab was Abd-al-shams, (or according to some, Amer,) surnamed Saba. This Saba had a great number of sons, two of whom, Himyar (pronounced by some Homeir) and Kahlan, had a numerous progeny. The family of Himyar, it appears had, during 2020 years, the general government over all the descendants of Saba who were settled in Yemen, whence the name of the Himyarides (or Homeritæ) was sometimes taken by foreign nations as synonymous with that of Sabæans. Himyar was, according to Arabian authors, the first king of the family of Kahtan that wore a crown. He is said to have governed fifty years. The only fact which we find recorded of him is, that he expelled the tribe Thamud from Yemen into Hejaz. Various reports exist as to Himyar's successor: according to some it was his son Wathel; according to others his brother Kahlan: probably Wathel succeeded him in Yemen, and Kahlan in Hadramaut. Similar variations in the lists of kings given by different authors (Abulfeda, Hamza of Isfahan, Nuweiri, Masudi, &c.) are observable throughout the antient history of Yemen. Among the succeeding rulers, Al-Hareth-al-Rayesh is distinguished as the first conqueror among the kings of Yemen; he also first received the title of Tobba, i. e., 'successor,' which became hereditary in his line. Dsu'l-manar Abrahah and his son Dsu'l-adsar are reported to have made conquests in Nigritia and other parts of Africa. The next sovereign but one in succession after Dsu'l-adsar is queen Balkis, according to Arabian authors, the queen of the Sabæans who visited Solomon (1 Kings x. 1, seq.; 2 Chron. ix. 1, seq.). Many generations after Balkis, in the reign of Akran, an event occurred which forms an important epoch in the history of Arabia. Impetuous mountain-torrents used frequently to destroy the labours of agriculture in the plains of Yemen, till some antient king (according to some, Lokman, according to others, Himyar himself) opened channels which brought the waters to the sea, constructed an immense dike or mound between two hills just above the capital Mareb (or Saba), which prevented sudden inundations, and from the reservoir thus formed, supplied the gardens and fields below, through aqueducts, with the necessary irrigation. The country around Mareb had thus become fertile and happy; but its prosperity depended on the preservation of the mound, which in the lapse of time fell into decay. Its final ruin is one of the few facts in the antient history of the Arabs, the period of which can with some degree of probability be ascertained. According to De Sacy, it occurred about the beginning of the third century. This event, which is in oriental writers designated by the name of *Seil-al-Arim*, i. e., 'the Torrent of the Mound,' caused a great change in the whole peninsula. Amru ben Amer, surnamed Mosaiqiya, one of the nobles of the country, perhaps the chief of the Kahlanides, had been previously warned of the imminent danger; he sold his estates, and with a number of families quitted Yemen and went into the country of Acc. After the death of Amru, the emigrant families separated, and settled in different countries. The family of Amru's son, Jafna, established itself in Syria, and founded the kingdom of the Ghassanides in the desert S.E. of Damascus, which embraced the Christian religion, and formed part of the Roman or Grecian dominions; till, in the reign of the caliph Omar, it was incorporated in the Mohammedan empire. The tribes of Aus and of Khasraj, descended from Amru by his son Thalaba, went to Yatreb (afterwards called Medina). The descendants of Azd settled partly in Oman, and partly in the country of Sherat in Syria; Malec ben Fahm, also of the family of Azd, established himself in Irak, and founded the kingdom of Hira, which was governed during 597 years by a succession of twenty-five kings, who at last became vassals to Persia; till, in the caliphate of Abu Bakr the country was subjected to

the Mohammedan dominion. The tribe of Tai, which had left Yemen soon after Amru ben Amer, settled in the Nejd, between the mountains of Aja and Solma, since called the mountains of Tai. The family of Rebia, grandson of Amru, settled at Mecca, and received the name of Khozaa.

In the series of the Himyaride kings that ruled over Yemen after Akran and the Seil-al-Arim, there is almost as much confusion as in the earlier part of it. We shall not enter into an enumeration of the names, but refer the reader to the dissertation of De Sacy, *Sur divers événements de l'Histoire des Arabes avant Mahomet*, in the fiftieth volume of the *Mémoires de Littérature of the French Academy*, and to Johannsen's *Historia Jemanae* (Bonn. 1828).

The fountain Zemzem and the black stone in the antient temple of Mecca, called the Caaba, had, from immemorial time, been regarded by the Arabs as national sanctuaries. The (modern) Jorhamides, descended from Jorham the son of Kahtan, had established themselves in Hejaz about the same time that Ya'rab settled in Yemen, and had for many ages been the hereditary protectors and keepers of the Caaba; when Amru ben Loheia of the tribe Khozaa, with the Yemenese emigrants from Acc, and assisted by the tribe of Bekr, availed himself of the opportunity of a dispute between the Jorhamides and the neighbouring Ismaelides, to expel the former from Mecca, and take possession of the sanctuary. Soon, however, the tribe of Bekr felt indignant at being excluded by a stranger from the governorship over the Caaba, which honour, after the services they had rendered, they considered due to themselves. They entered into a treaty with Kossai of the Ismaelide tribe of Koreish, and by his assistance compelled the tribe of Khozaa to resign the charge which it had assumed. But the tribe of Bekr was again excluded from the guardianship of the temple, which came through Kossai into the hands of the tribe of Koreish. It is calculated that this happened about A.D. 464.

The grandson of the Koreishide Kossai was Hashem, who is reported to have averted a famine by giving up his treasures. His son Abd-al-Motaleb is famous for his victory over Abraha, an Æthiopian ruler of Yemen, and a Christian, who approached Mecca with an army and several elephants, intending to destroy the Caaba. A miracle is said to have preserved the sanctuary, and to have destroyed the army of Abraha. The year of this victory is in the chronicles of the East named the 'Year of the Elephant,' in allusion to the elephant on which Abraha was mounted, which suddenly refused to proceed farther when the army was approaching the sacred city: it is the year 571 of our era. Another event rendered it still more universally memorable; for in it Hashem's grandson, Abdallah, became the father of the Arabian prophet Mohammed.

Yemen had since the Seil-al-Arim become temporarily subject to foreign power. The Jews, who since the destruction of Jerusalem had in great numbers retired into Arabia, had made proselytes of several Arabian tribes, particularly those of Kenana, Kenda, and Hareth ben Kaaba, and had already gained considerable power in some parts of the peninsula. Dsu-Nowas, who occupied the throne of the Himyarides towards the close of the fifth century, adopted their religion, and began cruelly to persecute all those who would not follow his example. Christianity had about the same time found its way into the southern parts of the peninsula, and had become the religion of the tribes of Himyar, Ghassan, Rebia, Tagleb, Bahra, Tanuh, Tai, and Kodaa, besides the inhabitants of Hira and of Nejran. The inhabitants of Nejran in particular were suffering from the atrocious cruelty of Dsu-Nowas, when the Negus of Habesh came to the assistance of his persecuted fellow Christians. The Jewish Arabs were vanquished; Dsu-Nowas, in despair, sought a voluntary death by throwing himself into the sea, and Yemen became an Æthiopian province. This Æthiopian occupation of Yemen became of a melancholy importance to the civilized world through the small-pox which the victors brought with them into Arabia, and which, by the conquests of the Mohammedans, soon spread all over the earth. In consequence of a revolt among the Æthiopian occupants, Abraha came in A.D. 549 to the command of Yemen. He endeavoured with great zeal to spread Christianity among the Arabs, and with this view built a church at Sana which he intended should, as a place of pilgrimage, vie with the ancient Caaba. The heathen Arabs, indignant at this measure, profaned the new-built church, and Abraha, to avenge the insult, resolved on an expedition against Mecca, the failure of which (A.D. 571) has already been

alluded to. After a reign of twenty-three years, Abraha was followed by his sons Yeksum (572-589) and Masruk (589-601). During the reign of the latter, Seif ben Dsi-Yezen, an offspring of the antient royal Himyaride family, obtained the assistance of a Persian army under Wehraz, with the aid of which he put an end to the Æthiopian power, after it had lasted about 72 or 73 years. Yemen was now governed by Persian prefects, till it became subject to the Mohammedans, when the last of the prefects, Badsan, embraced the Mussulman faith.

The Arabs before Mohammed, like those of the present day, partly dwelt in cities, and partly as wandering tribes in moveable encampments. The inhabitants of cities subsisted by agriculture and by different trades, especially by commerce, in which the tribe of Koreish appears early to have distinguished itself. The wandering Arabs employed themselves in the breeding and tending of cattle, and occasionally in the pillage of travellers. The picture exhibited by antient poets (especially in the romance *Antar* by Asmai) of their customs and mode of life, entirely corresponds to the representation which modern travellers make of the manners of the present Beduins. The elements forming the sphere of their life are so simple, and their habits so closely adapted to the nature of their country, that the lapse of time can work no perceivable change in their social state. Hospitality, expertness in the use of arms, horsemanship, and eloquence in his own copious and energetic language, were of old, as they still are, the accomplishments on which the Arab valued himself most.

With respect to the religion of the antient Arabs, our information is very imperfect. As they were ranging their trackless deserts beneath the concave of unclouded skies, they seem to have been early led to the worship of the heavenly luminaries. The tribe of Himyar is said to have chiefly worshipped the sun; Kenana, the moon; Tai, the fixed star Sohail (Canopus); Misam, the star Aldebaran, &c.: Saba, the ancient capital of Yemen, had a temple built in honour of the planet Venus; the temple of Mecca was, according to some, originally consecrated to Saturn; and Abd-al-Shams, i. e., 'Servant of the Sun,' is a name occurring several times in the fragments of Ante-Islamic history. The Koran alludes to three female deities: Allat, (see Herod. iii. 8.) adored by the tribe of Thakef, whose temple at Nakhla, was destroyed by Mogaira in the ninth year of the Hejra; Al-Uzza, adored by the tribes of Koreish and Kenana, under the form of a tree; and Menat, the goddess of the tribes of Hudseil and Khozaa. Two other deities, Asid and Naila, were adored by the tribe of Koreish, the one under the form of a man, and the other under that of a woman. Five more are noticed, which were worshipped under various human and animal shapes, besides a number of inferior idols, belonging to particular families. Among the tribe of Temim, in the Persian Gulf, the Persian fire-worship is said to have been introduced. The idea of goblins and fairies, some of a terrific; some of a mild and placid character, was early associated with the loneliness of the deserts. Fortune-telling, necromancy, astrology, and sorcery, were early at home in Arabia.

Such was the condition of the Arabs about the beginning of the seventh century. A few small provinces in the north had, like the neighbouring countries of Syria, Palestine, and Egypt, become subject to the Grecian empire, while those bordering on the Euphrates acknowledged Persian supremacy, and an Æthiopian dynasty ruled temporarily in the south. The great mass of the country remained free, and probably even ignorant of these slight encroachments of foreign dominion. The Arabs, long celebrated for their valiant and intrepid character, had never yet been united by a common tie into one mass. Their wandering tribes, without fixed mutual relations, scattered over a vast extent of land, and often engaged in transitory feuds among each other, continued to enjoy unlimited independence. The union of these tribes into a nation, and the greatness of that nation as a link in the chain of historical events, dates from the promulgation of the Islam by Abul-Kasem Mohammed. The noble inspiration, the firm belief in the truth and divine origin of the new religion, and the intrepid courage which animated the prophet and his successors, the natural inclination of the Arabs towards war and perilous undertakings, the weakness of the neighbouring governments, and the precept of the Koran, which enjoined the propagation of the Islam, and war against the unbelievers as a religious duty,—spread within a century

the dominion, the faith, and even the language of the Arabs, from the Atlantic Ocean to the Indus, and from the Indian Sea and the African Deserts to France, the Mediterranean, Asia Minor, and the Caspian Sea.

Mohammed was born in the tribe of Koreish, at Mecca, according to some on the 10th of November, 570, according to others on the 21st of April, 571, P.C. In his twentieth year he took part in an expedition against predatory hordes which then molested the pilgrims on their way to Mecca. Five years later he visited the fair of Damascus as the agent of Khadija, a rich widow, whom he subsequently married. In the fortieth year of his age (A.D. 610) came the *Leilat-al-Kadr*, i.e. 'the Night of the Divine Determination,' in which, the Mohammedans believe, the angel Gabriel called him to become the prophet of God. Khadija his wife, his cousin Ali ben Abi Taleb, and his father-in-law Abu-bekr, were the first who acknowledged his divine mission. Twelve years had elapsed, when a revolt at Mecca threatened the life of Mohammed. The day of his flight to Yatreb (since called Medina or Medinat-al-nabi, i.e. 'The Town of the Prophet'), the 16th of July, 622, has become the æra from which the Mohammedans count their years. With it commenced a war against the opposers of the new religion. When Mecca was conquered, when the tribes of Arabia joined in the profession, that 'There is no God but Allah, and Mohammed is his apostle,' the prophet commanded to spread the Islam over all countries, and to unite into one community, by conquest or by faith, all the nations of the earth. Mohammed died at Medina, the 8th of June, 632, in the sixty-third year of his age. [See MOHAMMED.]

The Byzantine empire had just then been engaged in a long conflict with Persia. The despotism of its rulers, frequent though inefficient revolutions, and constant efforts for the repression of foreign enemies, the low state of the finances, notwithstanding an oppressive taxation, and the discord of contending religious sects, had exhausted its strength. The Persian empire had sunk still lower: the superannuated doctrine of Zoroaster could no longer animate its followers in the contest against a religion defended and propagated by a new nation with all the vigour and enthusiasm of youth. This weakened state of the two principal neighbouring empires favoured the quick progress of the Arabian conquests. Whoever adopted the Mohammedan faith became embodied in the new state, and was no longer regarded as a stranger. Jews and Christians were tolerated, but required to pay a tribute: death awaited the followers of other religions. The supreme pontificate and worldly command were united in the person of Mohammed's successors, the caliphs. Many of these were individually weak; but their authority and the might of the empire were supported by a religious belief which was rooted deeply in the mind of the nation.

The history of the first century of the caliphate exhibits an almost continuous series of conquests. In the reign of Abu-bekr, the valiant Khaled conquered the whole of Syria and Mesopotamia; in that of Omar the victories of Amru ben al-Ash added Egypt to the Arabian empire; after a siege of fourteen months, Alexandria was taken; Memphis fell, and Amru laid in the neighbourhood of its ruins the foundation of Fostat, the present Old Cairo. The conquest of Egypt was soon followed by that of Cyrenaica and the other states along the coast of the Mediterranean: congenial habits united the Berber hordes of Africa with the sons of the Arabian desert. The victories won by Saad ben Abi-Wakkas over the Persian forces near Cadesia (635), Jalula (637), Holwan and Nehawend (642), decided the fall of the Persian throne. Under Osman, the island of Cyprus was plundered (648); Abdallah ben Amer conquered Khorasan, and penetrated as far as Balkh. The reign of Ali ben Abi-Taleb was spent in the quelling of internal commotions, which ended in the murder of the caliph by the hand of the fanatic Abdorrahman ben Moljam, and the accession of the Ommaiades to the caliphate.

Moawiya, the first of the Ommaiade caliphs, removed the residence of the empire from Kufa, near the Euphrates, to Damascus. In his reign Okba ben Nafi laid the foundation of Kairwan (675), and penetrated as far as Tanger and the Atlantic. Okba was murdered when he was preparing to pass over into Spain, in consequence of which many of the provinces conquered in these distant regions were lost again; but after a few years (688), the entire northern part of Africa, as far as the Straits of Gibraltar, was in the possession of the Arabs. In the reign of Walid I. (705-715),

the dominion of the Arabs attained its widest extent. Julianus, the governor of Ceuta, incensed, it is said, against his sovereign, king Roderic of Spain, who had disgraced his daughter, surrendered Algeziras (Jezirat-al-Khadra, 'the Green Island,') into the hands of the Arab Tarik ben Ziad, who, at the command of the African governor Musa ben Nusair, landed at the promontory which still bears his name (Gibraltar, corrupted from Jebel Tarik, the mountain of Tarik), vanquished Roderic in the battle of Xerez de la Frontera (19 July, 711), and in a short time subjected the greater part of Andalusia, Granada, and Murcia to the Mohammedan power. In the East, Koteiba ben Moslem, the governor of Khorasan, took possession of Mawaralnahr, Bokhara, Turkestan, and Khwarezm; and Mohammed ben Kasem-al-Thakefi made conquests in the northern parts of India. Under Soleiman (715-717) the greater part of Asia Minor was conquered, and Constantinople besieged; and in the reign of Omar ben Abd-al-Aziz (717-720) the countries of Jorjan and Tabaristan were added to the empire. But the want of energy of the latter caliph, as well as of his successor, Yezid II. (720-724), and the avarice of Hesham (724-743), roused a spirit of dissatisfaction in the interior, and encouraged the revolutionary attempts of other aspirants to the caliphate. It was in the reign of Hesham that the arms of the Muslims experienced their first signal defeat; the victory of Charles Martel over Abdorrahman ben Abdallah, near Poitiers (Oct. 732), checked for ever the farther progress of the Arabs on the continent of Europe: the river Aude, in Languedoc, became the frontier of their dominion.

When, in the year 749, the family of Abbas came to the command over the Faithful, all the surviving Ommaiades were cruelly persecuted: Abdorrahman ben Moawiya only escaped into Spain, and became the founder of the Ommaiade caliphate of Cordova (756).

Under the Abbasides, who fixed their residence at Bagdad, but few additions were made to the Mohammedan empire: the islands of Crete, Corsica, Sardinia, and Sicily, became subject to the Arabs of Spain and Africa. The sovereigns of the House of Abbas generally distinguished themselves as much by their love and zeal for the arts and literature, as their predecessors had done by their warlike achievements. The names of Mansur, Harun-al-Rashid, and Mamun, are for ever entitled to an honourable place in the history of letters, and their reigns form the brilliant epoch of the Mohammedan power. But their love of mental refinement, and their fondness for a quiet and luxurious life, withdrew the attention of the Abbaside caliphs from the affairs of government; internal disturbances soon became frequent; the authority of the court of Bagdad became imperceptibly diminished, at first in the distant provinces of the empire. Abdorrahman, by establishing an independent Ommaiade dominion in Spain, had set an example which the prefects of other countries soon followed. The caliphs were obliged to assemble a life-guard of Turkish mercenaries around their throne, and surrendered the care of the government into the hands of ministers of unlimited authority, the *Emirs al Omara*. Through these arrangements, and through the encroachments of the Seljukide Turks, the caliphate had long since become a merely nominal dignity, when Hulaku took Bagdad (1258), and put an end to the dominion of the Abbasides. [See ABBASIDES.]

The history of the several Mohammedan states which arose out of the caliphate from the ninth century, does not, strictly speaking, belong to the history of the Arabs; we shall, however, here briefly enumerate the principal dynasties.

I. In Spain, the Ommaiades reigned till 1038. Among the small principalities which sprung up afterwards, that of Granada maintained itself till 1492.

II. In Africa, 1. in Egypt, Ahmei ben Tulun established in 868 an independent dominion, which remained in the possession of his family, the *Tulunides*, till 905, when Egypt returned to its allegiance to the caliphate. From 935-969, the *Ikhshids* or *Akhshids*, the family of Abu Bekr Mohammed, a descendant of the ancient kings of Ferghana, ruled over Egypt. They were in 969 followed by the *Fatimides*, or *Moezzides*, who called themselves descendants of Fatima, the daughter of Mohammed: their dominion lasted for two centuries, and extended from the Euphrates to Kairwan. In 1171, the *Fatimides* were succeeded by the *Ayubide* dynasty, which was in 1250 followed by the dominion of the *Baharide Mamluks*. In 1517, Egypt became a Turkish province.

2. In Kairwan, Ibrahim ben Aglab declared himself independent in the reign of Harun-al-Rashid (805); the dominion of his family, the *Aglabides*, in the territory of the antient Carthaginians, continued till the beginning of the tenth century.

3. In Fez, Edris, a descendant of Fatima, founded an independent kingdom (788), which remained in the hands of his family, the *Edrisides*, till 985, when it became tributary to the Fatemides.

4. The *Zeirides*, descendants of Yussuf Belkin ben Zeiri, governed over Tunis and the surrounding country, from 978 till the middle of the twelfth century.

5. In Morocco, Abdallah founded about 1056 the religious sect and the dominion of the *Morabets*, which soon extended itself as far as the Straits of Gibraltar, and subsequently caused the fall of the Ommaiades in Spain. (See *ALMORAVIDES*.)

III. In Asia, 1. in Khorasan, Taher had already under Mamun, in 819, declared himself independent. His successors, the *Taherides*, were soon obliged (873) to yield the dominion over the adjoining Persian provinces to the *Soffarides*, descendants of Yacub ben Leith.

2. The *Samanides*, who pretended to be of the race of the antient kings of Persia, established a powerful dynasty in Khorasan and Mawaralnahr, which reigned from 898 till 999, when it was overthrown by the Gasnevites.

3. Nasreddin Sebuktegin founded the dynasty of the *Gasnevites* in the eastern part of Persia, which ruled at Gasna from 976 till 1182; they were obliged to yield to the *Gaurides*, and these, in 1208, to the sultans of Khwarezm.

4. The *Dilemite* dominion originated early in the ninth century, among the emigrant descendants and followers of the caliph Ali, who had taken refuge in the hilly parts of the provinces of Ghilan and Mazenderan. It continued from 927 till 1029, when the Gasnevites took possession of the country.

5. The *Buides* (properly *Bawaidides*) ruled in Persia, and had their residence at Shiraz: they were in 932 recognized by the caliphs. They kept the title and power of Emir-al-Omara till their dominion was overthrown by the Seljuks in 1056.

6. An *Ismaelide* dynasty arose at Kasbin in Persia since 1090, and lasted till the Tatar invasion in 1256. They are only a ramification of the religious sect of the Ismaelians, which, under different names (viz., Batenians, Karmates, Fatemides, Druzes, Nosairis, &c.), has often played an important part in the history of Mohammedism.

7. The *Hamadani* dynasty, in Syria, ruled over Mosul from 929 till 978; and their successors the Merdasides over Aleppo till 1086.

8. The *Assassins* were a fanatic sect in Mount Lebanon, who gained great importance at the time of the Crusades; the present Druzes are believed to be their descendants.

9. The *Seljukide Turks*, under Togrul Beg, occupied Bagdad in 1055; their dominion over Aleppo lasted till 1154; over Kerman till 1187; over Iran till 1195; and over Iconium till 1308. Independent of them, a dynasty of Atabeks had since 1127 established itself in the country east of the Caspian Sea.

Since the time when the Ommaiade caliph Moawiya chose Damascus for his residence, and still more when the Abbasides removed the seat of the government to Bagdad, the country of Arabia relapsed into its former insignificance; it became a mere province of the Mohammedan empire, and was soon again divided into small domains. Curious details about the history of one of the most important of these divisions, that of Yemen, from the time of Mohammed till near the close of the fifteenth century, are to be found in Johannsen's *Historia Jemenæ*. Except the monotonous enumeration of the annual procession of pilgrims to the sacred city, the mutual conflicts among the Beduin chiefs, and of late the rise of the Wahhabite power in the Nejd, the recent history of Arabia generally offers little of sufficient interest to fix the attention of the general historian.

After the conquest of Syria, Persia, Mauritania, and Spain, the trade of the Arabs became of great importance. The Islam favoured the establishment of emporia, and the wide dominion of one religion and one language rendered travels and mercantile transactions easy. The luxury of the court of Bagdad, and the magnificence of the Abbasside caliphate, caused frequent travels of merchants into India. Since the ninth century of our era, Arabs began to settle in various parts of India; several Indian princes embraced

the Mohammedan faith. Soon the Arabs penetrated to the Indian islands, Ceylon, Sumatra, Java, Celebes, and even to China. Arabian caravans proceeded over land as far as Tartary and Siberia in the north; in Africa they came to the Niger, where, since the tenth century, the Mohammedan states of Ghana, Wangara, Tokur, Kuku, and afterwards those of Sennaar, Darfur, Burnu, Tumbuctu, and Melli, were founded. On the coasts of Africa they came through the Straits of Bab-el-Mandeb to Zanguebar, established the harbours of Makdashua, Melinde, Sofala, Keliu, and Mozambique, and went over to Madagascar. It is even probable that Lusitanian Arabs were, in the eleventh century, the first discoverers of America. (See *Notices et Extraits des MSS. de la Bibl. du Roi*, vol. ii. p. 25; Kosegarten, *Dissert. de Mohammede Ebn Batuta*, Jena, 1815, 4to.; Rasmussen, *Essai sur le Commerce et les Relations des Arabes et des Persans avec la Russie et la Scandinavie dans le moyen âge*, in the *Journal Asiatique*, vols. v. and vi., Paris, 1824, 1825, 8vo.)

Arabic Language.—The Arabic forms, with the Ethiopic, the southern ramification of the great stock of languages commonly, though improperly, called the Semitic; the other two principal branches are, 1. the Aramaic branch, indigenous in Syria, Mesopotamia, and Babylonia, comprising the Syriac and Chaldee languages; and 2. the Hebrew, once the language of Palestine and Phœnicia. These dialects have flourished at different epochs. Of the Hebrew, we possess the earliest written documents. About the time when it ceased to be a living language, the Chaldee makes its appearance. Whatever we possess in Syriac is of a still more recent date. The literature of the Arabic language does not reach far back beyond the age of Mohammed. At present most of these Semitic languages are extinct, or survive only in small districts. The Arabic alone has outlived all its sister-tongues, and has spread not only as the vernacular tongue all over Syria, Egypt, and Northern Africa, but also as the language of religion throughout Persia, the Turkish empire, and all countries into which the Mohammedan faith has been introduced.

Various dialects prevailed among the Arabian tribes previous to the age of Mohammed, among which that of the tribe of Koreish has, through the Koran, become the classical tongue. Ebn Khaldun thinks that the reason of the elegance and purity of the Koreishide dialect is to be found in the seclusion of that tribe from intercourse with foreigners. Next to Koreish, the neighbouring tribes of Thakif, Hudseil, Khozaa, Kenana, Asad, Temim, and Ghafan, are by native writers distinguished for the correctness of their language; less so the Yemenese Arabs, and the tribe of Rebia, Lakhm, Jodham, Ghassan, Iyyad, and Kotbah. Niebuhr observes that the Arabic is at present spoken with the greatest purity in the district of Sahan. The Arabic language is rich, not only in words (especially in such as refer to natural objects and to the life of a nomadic people), but also in grammatical inflections, particularly in the verb, where certain general modifications of the meaning are briefly and energetically expressed by slight changes in the form of the roots. The purity and copiousness of the language had among the Arabs long been an object of national pride. When, after the first conquests of the Mohammedans, its genuine correctness seemed to become endangered through the frequent and unavoidable intercourse with strangers, grammarians arose, to fix its rules and secure it from corruption. Abu'l-Aswad al-Dhali mentioned as the first author on Arabic grammar; he flourished under the caliph Ali ben Abi Taleb. Among the subsequent Arabian grammarians, Sibawaih, Ebn Malek, Zamakhshari, Ebn Hesham, Ebn Doreid, Mozarezi, Tebrizi, Beidhawi, &c., deserve to be distinguished. Khalil ben Ahmed al-Ferahidi, of Basra, who lived during the second century of the Hegira, reduced the prosody and metrics of the Arabic poets into a system. Abu'Nasr Ismael ben Hammad al-Jauhari (A.D. 1000, or, according to others, 1009) compiled a dictionary of the pure Arabic language, containing about 40,000 words, and entitled *Siḥah*, i.e., 'the Purity (of language)'; this work is of great value in oriental philology on account of the numerous quotations from antient poems which are added in illustration. Al-Darir and Al-Sighani, two other lexicographers flourished, the one in the eleventh and the other in the thirteenth century. In the fourteenth, Mohammed ben Yacub al-Firuzabadi (A.H. 817, A.D. 1414) compiled an immense Arabic thesaurus, entitled *Al-Lam'ah*, i.e., 'the

‘Illuminator,’ of which the author himself prepared an abridgment under the title of *Al-Kamus*, or ‘the Ocean;’ the latter work contains about 60,000 words, and is the best original Arabic dictionary that we possess; an accurate edition of it was published at Calcutta in 1817; a Turkish translation appeared at Scutari, in three volumes, folio, 1815-1817.

The period at which the art of writing was introduced into Arabia is not known. Arabian authors speak of an alphabet used by the antient Himyarides, which they call *Al-Mosnad*: this alphabet is now lost. In the second volume of the *Mines de l'Orient* may be found a copy of a few undeciphered inscriptions discovered by Seetzen, between Doffar and Mankat, near Jerim, in Yemen, which he supposed to be in the *Mosnad* character. The northern Arabs do not appear to have had any alphabet till a short time before Mohammed: Morar ben Morrah is said to have introduced an alphabet which was founded on the Syriac Estrangelo character. In it the Koran was written, originally without diacritical points and vowels, which were, however, added before the end of the first century after the Hegira. This character, which was called the Cufic, in allusion to the copyists that lived at Cufa, remained long in use on coins and inscriptions: for common purposes a current handwriting, known under the name of *Neskh*, was introduced by Ebn Mokla, in the tenth century. This is the character still in use: the Persian *Ta'liq* and the African *Mogrebi* character are modifications of it.

To European students who wish to acquire a knowledge of the Arabic language the following works deserve to be recommended:—Silvestre de Sacy's *Grammaire Arabe*, 2d edit., Paris, 1832, 2 vols., 8vo.; Ewald's *Grammatica Critica Linguae Arabicae*, Leipzig, 1831-1833, 2 vols., 8vo.; Rosenmüller's *Institutiones ad Fundamenta Linguae Arabicae*, Leipzig, 1818, 4to.; S. de Sacy's *Chrestomathie Arabe*, 2d edit., Paris, 1826-1830, 4 vols., 8vo.; Kosegarten's *Chrestomathia Arabica*, Leipzig, 1828, 8vo.; Golius' *Lexicon Arabico-Latinum*, Lugduni Batav., 1656, folio; Wilmet's *Lexicon Linguae Arabicae in Coranum, &c.*, Rotterdam, 1784, 4to.; Freytag's *Lexicon Arabico-Latinum*, Halle, 1830, seqq., 4to. (not yet completed.)

The modern vernacular Arabic does not materially differ from the classical language of the Koran, which has become the model and standard of correctness for all Arabic writers; but in the grammatical forms time seems to have produced a change similar to that which we perceive in other languages, the history of which we can trace with accuracy. Many terminations in the inflections of the verb and noun have disappeared, and their want is supplied by auxiliary words. The pronunciation is said to vary considerably in different countries: that of Yemen is esteemed the purest. Among the grammars which have appeared of the modern Arabic, that of Caussin de Perceval (Paris, 1823, 4to.) is considered the best.

Arabic Literature.—It is now generally agreed by those who study oriental literature, that the Arabs do not possess any authentic literary relics anterior to the sixth century of our æra, and that the poems called *Moallakat* all belong to that or the beginning of the next century. It cannot, however, be disputed that, at the time when they were composed, the language and the poetry of the Arabs had already attained a high degree of cultivation; the language appears in them with perfect grammatical regularity, and subject to all the rules of a fixed system of prosody.

The life of a nation secluded by the nature of its country from the introduction of foreign refinement, and compelled by its occupations of hunters and herdsmen to live in small clans spread over a wide extent of country, amidst the awful solitude of deserts, the terrors of which, while tempting the spirit of the hazardous to dangerous enterprise, seem to endear the security of a sociable home, and to tie closer the bonds of fellowship, appears of itself rich in poetic elements; and indeed, as far as we are able to trace back the character of the Arabs, we find the love of poetry one of its essential features. The appearance of a poet in a family was hailed with congratulations by the neighbouring tribes, and we hear of assemblies annually held at Okadh, in Yemen, where poets from all parts of Arabia contended for a prize by reciting their compositions: the poems of the successful competitors were, it is said, written in letters of gold and hung up on the Caaba, whence they were named *moallakat*, i.e., ‘the suspended.’ Seven of these poems, those of Amru ben Kolthum, Amrulkeis, Antara, Tarafa, Lebid, Hareth, and Zohair, have been preserved to us; and the careful man-

ner in which they have been commented upon by native grammarians (Zuzeni, Nahas, &c.) attests the importance that was attached to them by the Arabs in subsequent ages. The poem of Shanfara, that of Asha, and that of Nabega Dhobyani, are in some manuscripts appended to the *Moallakat*. More comprehensive collections of antient poems are the *Diwan* of the Hudseilides, the *Hamasa* of Abu Temmam (about A.D. 830) explained by the scholiasts Tebrizi and Merzuki, and the small *Hamasa* of Bokhtori (A.D. 896). A *Diwan* of Hatim Taï and of Taabbata-Sharran, besides a single poem of Caab ben Zohair, are handed down separately.

Mohammed recommended learning and poetry, and the admired and often truly sublime diction of the Koran attests that he himself was no stranger to the powers of poetic language. Yet during the first century after his death, in the reign of the warlike Ommaiades, the voice of poetry was silenced or not heard in the noise and tumult of war. ‘But,’ says Abulfaraj (*Hist. Dyn.*, p. 246), ‘when Allab called the family of Haahem (i.e. the Abbases) to the government, and surrendered to them the command, the hearts returned from their indolence, the minds awoke from their torpor.’ Among the writers who flourished under the earlier Abbaside caliphs, Asmai deserves to be distinguished: to him is ascribed a romance of great celebrity in the east, called *Antar*, after the name of its hero; it exhibits an interesting picture of the condition of Arabia shortly previous to the appearance of Mohammed, especially of the life of its wandering tribes, of which it gives as lively a representation as the well-known *Arabian Nights* do of the state of society in the Arabian towns. The exact period to which the composition of this latter work must be assigned is still subject to discussion. That some of the most fanciful and enchanting tales in the collection are derived from an Indian source appears to us undeniable, although notions and images suited to the sphere of ideas of a Mohammedan and an inhabitant of western Asia have been carefully substituted for every allusion to polytheism and Hindoo institutions that might have puzzled the imagination or shocked the good sense of a Mussulman reader.

Among the poets who flourished during the caliphate, we must be satisfied here to mention the names of Abu'l-Atahia, Du'ul-Rumma, Ferezdak, Abu Temmam, Bokhtori, Hamadani, Hariri, Motenabbi, Abu'l-Ola, Omar ben Faredh, &c. Specimens of the works of some of them will be found in the *Anthologie Arabe*, by Grangeret de Lagrange (Paris, 1828); in the collection published at Calcutta, under the title of *Hadikat-al-Afrah*; and in Carlyle's *Specimens of Arabian Poetry* (Cambridge, 1796).

Al-Mansur, the second of the Abbaside caliphs, was the first who distinguished himself through his zeal for literature, especially for the study of the law, of astronomy, mathematics, and philosophy. The celebrated Christian physician, George Bakhtishu, with his disciple Isa ben Shahata, and the Persian astronomer Nubakht, lived at Al-Mansur's court: Bakhtishu seems to have first drawn the attention of the Arabs to Greek and Syriac literature. Harun al-Rashid, by the advice of his accomplished minister and friend Yahya ben Khaled, the Barmecide, called Gabriel the son of Bakhtishu to his court, who then lived at Nishabur; he caused many Greek and Syriac works to be translated into Arabic, and established colleges in the principal towns of the empire. In the reign of Mamun the literature of the Arabs saw its golden age. Among the foreign scholars who lived at his court, we distinguish the Indian physician Saleh ben Nahala, and the Syrian Yahya ben Mesawaih (commonly called Joannes Mesue). The works of Aristotle, of Hippocrates, Galen, Dioscorides, and Theophrastus, of Euclid, Archimedes, and Ptolemy, were translated partly from the Greek originals, partly through intermediate Syriac versions. Among the translators we find mentioned the Sabian astronomer Thabet ben Korra; the Christian physician Honain, with his son Ishak, and his grandson Hobaish ben al-Asam; Yahya ben Batrik, Yahya ben Adda, Ibrahim ben Takwin, and others. At the command of Mamun, Mohammed ben Musa, of Khwarezm, wrote the first elementary treatise on Algebra, evidently drawn in a great proportion from Indian sources. Mamun founded academies at Bagdad, Basra, Kufa, and Bokhara, and furnished scholars with the necessary means to visit foreign countries for literary purposes. In his reign Yahya ben Abi'l-Mansur built and superintended observatories at Bagdad and Damascus. Soon after the accession of Theophilus to the throne of the Grecian empire (A.D. 829) a war

had broken out between him and Mamun, in which Theophilus was unsuccessful. He was, like his antagonist, a friend to science, and, in order to negotiate a peace, sent the celebrated scholar Joannes Grammaticus as ambassador to the court of the caliph. The assistance and advice of this envoy were of great value in the scientific undertakings then encouraged by Mamun; and Joannes was so much in favour at Bagdad, that he would doubtless have effected a reconciliation between the two courts, had not the caliph died in the midst of the negotiation.

In the subsequent times of the caliphate, the Emirs al Omara and the Bawahide (Buide) sultans encouraged literature; in almost all the dynasties which sprung out of the caliphate, there were some sovereigns, at least, who loved the sciences and patronized scholars. The dynasty of the Fatemides in Egypt is in this respect distinguished. Ibrahim ben Aglab, the founder of the Aglabide dynasty, made Kairwan a seat of learning; and Zeiri encouraged literature in the town of Afshir, which he had founded in the territory of the present Algiers.

In Spain, the Ommiade-caliphs followed the example of Al-Mansur and his successors. An exchange of learned ambassadors took place between Abdorrahman III. (912-961) and the German Emperor Otto I. His son Hakem founded the university of Cordova, and many colleges and libraries in Spain; his own library is said to have contained not less than 600,000 volumes. Gerbert of Aurillac, who afterwards ascended the papal throne as Sylvester II., studied at Cordova, and introduced into Europe the Arabic decimal system of numerical notation, for which the Arabs themselves were indebted to the Hindoos. Several English scholars, Adelard or Adhelard of Bath, in the eleventh, and Robert and Daniel Morley in the twelfth century, also visited the Arabic universities of Spain. It was through Spain, and through the Arabic versions, that the attention of the schoolmen was first drawn to the writings of Aristotle.

Among the Arabic philosophers, Pococke (in a note prefixed to his edition of Ebn Tofail) selects the following as the most distinguished: Abu Nasr Mohammed al-Farabi (died A.D. 942), Abu Ali al-Hossein ben Abdallah ben Sina, commonly called Avicenna (born A.D. 980), Abu Hamed Mohammed al-Gazali (d. A.D. 1111), Abu Bekr Mohammed ben Yahya ben Baja, commonly called Avenpace (d. A.D. 1129 or 1139), Abu'l-Walid Mohammed ben Ahmed ben Mohammed ben Roshd, commonly called Averroes (d. A.D. 1198), and Abu'l-Kasem al-Jonaid (d. A.D. 910).

Some of the most celebrated Arabic writers on mathematics and astronomy are the Sabian Thabet ben Korra, the Christian Is'hak ben Honain, Mohammed ben Musa, Jaber ben Afla, Behaeddin of Amol, Mohammed ben Jaber al-Battani, Al-Fergani, Ibn Yunis, Abu'l-Hassan Kushyar, Ulugh-Beg, &c.

The literature of the Arabs is particularly important on account of its numerous and valuable historical works: of most of the following authors in this department, the reader will find some account by turning to their respective articles. The earliest historical writer of the Arabs, of whom we have any knowledge, was Hesham ben Mohammed ben Shoaib al-Khelebi (d. A.D. 826). In the same century lived Ibn Koteiba, Abu Obeida, Mohammed ben Omar al-Wakedi, Abu'l-Abbas Ahmed al-Beladorsi, and Asraki. Since the beginning of the tenth century, history became a favourite study of the learned Arabians. Masudi, Tabari, Hamza of Isfahan, and the Christian patriarch of Alexandria Eutychius, also called Said ben Batrik, were among the earliest authors of works on universal history. They were followed by Abulfaraj, George Elmakin, Ibn al-Amid, Ibn al-Athir, Mohammed Hemavi, Abulfeda, Nuweiri, Jelaeddin Soyuti, Ibn Shohna, Abu'l-Abbas Ahmed al-Dimeshki, &c. Abu'l-Kasem Khalef ben Abdalmalek ben Baskwal of Cordova (d. 1139), Temimi, Ibn Khatib, Ibn Alabar, Ahmed ben Yahya al-Dhobi, and Shehabeddin Ahmed al-Mokri (or al-Makari) wrote chronicles of the Arabian dominion in Spain; Kotbeddin in the sixteenth, and Abu'l-Hassan Bekri in the eighteenth century, composed histories of Mecca; Omar ben Ahmed Kemaleddin (d. 1261) wrote a chronicle of Aleppo; Ibn Khallican, Ibn Abi Oseibia, Dsahebi, and others, compiled biographical dictionaries; Makrizi, Abdalatif, Shehabeddin ben Abi Hijla, Marai ben Yussuf al-Hanbali, Jemaeddin Yussuf ben Tagri Bardi, and Mohammed ben al-Moti, wrote special works on the history of Egypt; Behaeddin and Emadeddin wrote biographies of the Sultan Saladin; Ibn Arabshah described the life of Timur;

Ibn Khaldun, besides various other works of high interest, wrote a history of the Berbers; Haji Khalfa composed a bibliographic work on the history of literature among the Arabs, Persians, and Turks.

Damiri, Ibn Beitar, and Kazwini, left books on natural history; the latter is also the author of a work on geography. Peculiar to the Arabic geographers is the division of the earth (the northern hemisphere) into seven climates, or as many zones, which are counted from the equator towards the north pole, and are measured by the increase of the duration of daylight at the summer-solstice. Among the Arabic writers on geography we must notice Ibn Khordadbeh, Istakhri, Abu Is'hak al-Faresi and Ibn Haukal, who flourished in the tenth century; the Sherif Edrisi (often called *Geographus Nubiensis*), who lived in the twelfth century in Sicily under Roger I.; Omar Ibn-al-Wa'di; Yakuti (d. 1249), and Al-Osyuti. More information than from the professedly geographical works of some of these writers, may perhaps still be obtained from the accounts given by Arabic travellers of the countries which they had visited. Al-Hassan ben Mohammed al-Wassan al-Fasi, of Grenada, commonly known under the name of Leo Africanus, travelled through Asia and Africa; Ibn Waheb and Abu Zeid al-Hassan visited India and China in the ninth century; Selam al-Tarjoman visited central Asia during the reign of the caliph Wathek; Abdal-Rizzak travelled in the fifteenth century as ambassador from Persia to India; Mohammed Ibn Batuta wandered in the fourteenth century through the interior of Africa, India, Java, China, Russia, Greece, Spain, &c.

A history of Arabic literature is still wanted. A good account of the works printed in Arabic till the year 1811 may be found in Schnurrer's *Bibliotheca Arabica*. Those who want further information on the subject of Arabic literature must consult the *Notices et Extraits des MSS. de la Bibliothèque du Roi*, the *Bibliotheca Arabica Escorialensis* of Casiri, the *Bibliotheca Orientalis* of Assemani, the *Chrestomathie Arabe* and other works published by De Sacy, Möller's *Catalogue of the Arabic MSS. at Gottha*, Uri's and Nicoll's catalogues of the MSS. in the Bodleian library, the *Mines de l'Orient*, the *Bibliothèque Orientale* of D'Herbelot, &c.

ARABIAN GULF. [See RED SEA.]

ARABIAN NIGHTS. [See ARABIA, p. 219.]

ARABII were, according to St. Augustin (*Hæres. c. 83*), a sect of Christians in Arabia, who believed the human soul to be mortal, and that it is dissolved by death together with the body, but will be restored to life at the resurrection. Mosheim (in *Commentariis de Rebus Christianorum ante Constantinum Magnum*, ed. 1753, p. 718, seq.) thinks, that the materialism of Epicurus had some influence on the origin of this sect: but it is more likely that the prevailing opinion in those days of the materiality of the human soul occasioned their heretical inferences. The Arabii were confuted and converted by Origen in a synod held in Arabia, A.D. 246 (Mansi, *Collectio Conciliorum*, t. i. p. 789).

ARABLE LAND, so called from the Latin word *arare* 'to plough,' is that part of the land which is chiefly cultivated by means of the plough.

Land in general is divided into arable, grass land, wood land, common pasture, and waste. The first of these is by far the most important in agriculture. In this article we shall briefly explain the principles on which are founded the most improved methods of cultivating arable land, by which the natural produce of the soil is greatly increased, and many productions are obtained in perfection which are foreign to the soil and climate.

We shall, first, consider the nature and properties of various soils.

2. The best modes of preparing and improving the natural soil, so as to increase its produce.

3. The most advantageous succession of crops, so as to obtain the greatest returns, with the least diminution of fertility.

Of Soils.—When the surface of the earth is penetrated we generally find that the appearance, texture, and colour vary at different depths. There is a layer of earth nearest the surface, of greater or less thickness, which covers the more solid and uniform materials which lie below it. This may be particularly observed wherever there are natural or artificial excavations or pits. A distinct line, nearly parallel to the surface, generally marks the depth of the upper soil and separates it from the sub-soil. The soil is more or less composed of minute parts of various kinds of earth, mixed

of animal and vegetable substances, in different states of decomposition; and to these, in a great measure, it owes its colour, which is generally darker than that of the sub-soil. Except where iron, peat, coal, or slate abound in the soil, a dark colour is an indication of corresponding fertility. The rich soil of gardens, long cultivated and highly manured, is nearly black. As the soil is the bed in which all vegetable productions are to be reared, and in which they are to find their proper nourishment, its texture and composition become objects of great importance to the cultivator; and, without a competent knowledge of these, no practical rules can be laid down or depended upon.

All soils are composed of earths,* metallic oxides, saline substances, vegetable and animal matter, and water. The earths are chiefly clay or alumina, flint or silica, and lime.

Magnesia, barytes, and other earths are occasionally met with, but in so few instances that they may be omitted in the list.

Of the metals, the most abundant is iron in the state of peroxide. The other metals are rarely found near the surface.

Saline substances form a small part of a soil, but an important one.

Potassa exists in almost every vegetable, soda in a few and ammonia is produced by the decomposition of a mal matter, but from its volatile nature it is not long retained in the soil, except when it forms a fixed compound with other substances.

The vegetable acids, as a general rule, are perhaps limited to small portions of acetic acid in combination with some base, as lime or potash.

The mineral acids are found united with earths and alkalis, in the state of neutral compounds.

These saline substances have a powerful effect on vegetation, and a knowledge of their proportions in the soil and of their various qualities, is indispensable in order to modify or correct their action by other substances for which they have an affinity.

Water, in a state of combination, or of mere mechanical diffusion, is essential to the growth of all plants: without it, and atmospheric air, there is no life either animal or vegetable.

Of the Earths.—Clay or alumina, so called because it is obtained in its purest state from alum, in which it is combined with the sulphuric acid,† is the basis of all strong and heavy soils. When it is minutely divided, it is easily suspended in water; when dried slowly, and stirred while drying, it becomes a fine powder soft to the feel, and when kneaded with water, a tough ductile mass easily moulded into hollow vessels, which retain liquids. This property, of being impervious to water, gives the specific character to clay as an ingredient of the soil. In a pure and unmixed state it is absolutely barren. When clay is heated to a great degree, it parts with the water combined with it; it is then said to be baked, as we see in bricks. It is no longer diffusible in water, and differs little from silica or sand in its effects on the soil.

Silica, or the earth of flints, suffers no change in water. It consists of crystals, or fragments, of very hard stone, forming gravel or sand according to their size; and the finest siliceous sand, when examined with a magnifying glass, has the appearance of irregular fragments of stone without any cohesion between them.

Siliceous sand holds water in its interstices by simple cohesive attraction in proportion to its fineness. It heats and cools rapidly, letting the water pass through it readily, either by filtration or evaporation. Its use in the soil is to keep it open, to let the air and water, as well as those other substances on which the growth of plants depends, circulate through it. Unmixed, it dries so rapidly that no vegetation can continue in it, unless a constant supply of moisture be given by irrigation. A small portion of clay will much improve light sands; it takes a large quantity of sand to correct the tenacity of clay.

Lime in its pure state is familiar to every one as the basis of the mortar used in building. It is produced by burning marble, chalk, limestone, or shells, in a great heat. In the stones which are formed principally of lime, it is combined

* We retain the old division, although the earths have been ascertained to be oxides of peculiar metals, but as they are never found in the soil in their metallic state, the results and reasonings are not affected by this circumstance.

† Sulphuric acid, commonly called oil of vitriol, is composed of sulphur and oxygen, which is the pure or vital part of the atmosphere. [See AIR.]

with some acid, most generally the carbonic acid, which separates from it by the operation of burning, in the form of an air or gas, hence called *fixed air*, from its being thus fixed in a stone. These stones, of various degrees of hardness, are now all classed under the name of carbonates of lime.

Lime unites readily with water, which it also absorbs from the atmosphere. It then becomes *slaked*. By uniting with carbonic acid, it returns to its former state of carbonate; with this difference, that, unless much water be present, it remains a fine impalpable powder. Pure lime is soluble in water, though sparingly; a pint of water cannot dissolve more than about twenty grains: the carbonate is not soluble in water. Carbonate of lime has a powerful effect on the fertility of a soil, and no soil is very productive without it. It is consequently used extensively as an improver of the soil, otherwise called a *manure*; but its use in this respect, and the mode in which it acts, will be given in the articles *MANURE* and *LIME*.

Carbonate of lime, as an earth, is neither so tenacious as clay, nor so loose as sand. In proportion to the fineness of its particles it approaches to the one or the other, and when the parts are large and hard it takes the name of limestone gravel.

Its distinguishing feature is its solubility in acids, which it neutralizes, depriving then of their noxious qualities in the soil. A proper mixture of these three earths, in a due state of mechanical division, forms a soil well fitted to the growth of every species of plants, especially those which are cultivated for food; and nothing more is required than a proper climate as to heat, a proper degree of moisture, and sufficient nourishment, to make all the plants generally cultivated thrive most luxuriantly in such a mixture, which is usually called a loam.

But there are some soils, which, besides a proper mechanical texture and mixture of earths, contain a large proportion of a natural manure which renders them extremely fertile. This is a substance produced by the slow decay of animal and vegetable matter. It can be separated from the other parts of the soil, and has been accurately analyzed and described by many of the most experienced chemists, particularly by Fourcroy, Davy, Chaptal, and Theodore de Saussure. (See *Recherches Chimiques sur la Végétation*, Paris, 1804, 8vo.) This substance has been called *vegetable mould*; but, as this is not a very distinct term, we shall, after Thaeer and other eminent writers on agriculture, adopt the name of *humus* when speaking of it. Humus is a dark, unctuous, friable substance, nearly uniform in its appearance. It is a compound of oxygen, hydrogen, carbon, and nitrogen, which, with the exception of nitrogen, which is found only in some substances, are the elements of all animal and vegetable substances. It is the result of the slow decomposition of organic matter in the earth, and is found in the greatest abundance in rich garden mould, or old neglected dunghills. It varies somewhat in its qualities and composition, according to the substances from which it has been formed, and the circumstances attending their decay. It is the product of organic power, such as cannot be compounded *chemically*.

Besides the four essential elements in its composition, it also contains other substances in smaller quantities, viz., phosphoric and sulphuric acids combined with some base, and also earths and salts. Humus is the product of living matter and the source of it. It affords food to organization. Without it nothing material can have life. The greater the number of living creatures, the more humus is formed: and the more humus, the greater the supply of nourishment and life. Every organic being in life adds to itself the raw materials of nature, and forms humus, which increases as men, animals, and plants increase in any portion of the earth. It is diminished by the process of vegetation, and wasted by being carried into the ocean by the waters, or it is carried into the atmosphere by the agency of the oxygen of the air, which converts it into gaseous matter. See Thaeer, *Grundsätze der Rationellen Landwirthschaft*: Berlin. 1810, four vols. 4to.)

Humus, in the state in which it is usually found in the earth, is not soluble in water, and we might have so difficulty in comprehending how it enters into the minute vessels of the roots of plants; but here the admirable provision of nature may be observed. Humus is insoluble and antiseptic; it resists further decomposition in itself, and other substances in contact with it. It remains for a long time in the earth unimpaired; but no sooner is it brought

into contact with the atmosphere, by the process of cultivation, than an action begins. Part of its carbon uniting with the oxygen of the atmosphere, produces carbonic acid, which the green parts of plants readily absorb: while its hydrogen with the same forms water, without which plants cannot live; and in very warm climates, where this process goes on more rapidly, the moisture thus produced keeps up vegetable life, when rains and dews fail. The residue becomes a *soluble extract*, and in that state is taken up readily by the fibres of the roots. But the changes still go on; the extract absorbs more oxygen, and becomes once more insoluble, in the form of a film, which Fourcroy calls *vegetable albumen*, and which contains a small portion of nitrogen, readily accounted for. By bringing fresh portions of humus to the surface and permitting the access of air to it, more carbonic acid, water, extract, and albumen are formed, and give a regular supply to the plants, which, by their living powers, produce the various substances found in the vegetable kingdom of nature. Hence we see the great importance of frequently stirring the surface of the earth between cabbages and other vegetables.

It is to the patience and perseverance of the chemists above-named that we owe this insight into the wonderful process of vegetable growth. What we here state is on their authority.

We can now readily understand the great importance of humus, and of those rich manures which are readily converted into it, when not immediately absorbed by plants. But it has still another property, highly important to fertility: it renders stiff clays porous, and consolidates loose sands. It does so more than lime, or any other earth. Hence a soil with a considerable proportion of humus is much more fertile than the quantity of alumina, or of sand, in its composition would lead one to expect, as we shall see when we come to the analysis of soils of known fertility; and we see the great advantage of animal and vegetable manures, not only as nourishment to vegetables, but as mechanical improvers of the texture of soils.

The greatest enemy of humus is stagnant water; it renders it acid and astringent, as we see in peat; and soils abounding with vegetable matters, from which water is not properly drained, become *sour*, as is very justly said, and produce only rushes and other useless and unpalatable plants. The remedy is simple and obvious; drain well, and neutralize the acid with lime; by these means abundant fertility will be restored.

In very light soils humus is seldom found in any quantity, being too much exposed to the air, and rapidly decomposed; the extract is washed through them by the waters, and as they waste manure rapidly, they are called *hungry*. Such soils are very unprofitable, until they are improved and consolidated by clay or marl, which makes them retain the moisture.

With calcareous earths humus acts well, provided they are pulverized and of sufficient depth. Some chalky soils are rendered very fertile by judicious culture and manuring.

In order to ascertain the probable fertility of a soil, it is very useful to analyze it and find out the proportion of its component parts. To do this with great accuracy requires the knowledge of an experienced chemist; but, to a certain degree, it may be easily done by any person possessed of an accurate balance and weights, and a little *spirits of salts*, or muriatic acid. For this purpose, some of the soil, taken at different depths, not too near the surface (from four to eight inches, if the soil is uniform in appearance), is dried in the sun till it pulverizes in the hand, and feels quite dry: the small stones and roots are taken out, but not minute fibres. A convenient portion of this is accurately weighed: it is then heated in a porcelain-cup, over a lamp, or clear fire, and stirred, till a chip or straw put in it turns brown. It is then set to cool, and weighed; the loss of weight is the water, which it is of importance to notice. Some soils, to appearance quite dry, contain a large proportion of water, others scarcely any. It is then pulverized and sifted, which separates the fibres and coarser parts. The remainder, again weighed, is stirred in four or five times its weight of pure water; after standing a few minutes to settle, the water is poured off, and it contains most of the humus and soluble substances. The humus is obtained by filtration, well-dried over the lamp, and weighed. The soluble substances are obtained by evaporating the water; but, unless there is a decidedly saline taste, this may be neglected. The humus may be further examined by heating it red hot in a cru-

cible, and stirring it with a piece of the stem of a tobacco-pipe, when the vegetable part will be consumed, and the earths remain behind; thus the exact quantity of pure vegetable humus is found. Some muriatic acid, diluted with five times its weight of water, is added to the deposit left after pouring off the water containing the humus and soluble matter; the whole is agitated, and more acid added gradually, as long as effervescence takes place, and until the mixture remains decidedly acid, which indicates that all the calcareous earth is dissolved. Should there be a great proportion of this, the whole may be boiled, adding muriatic acid gradually, till all effervescence ceases; what remains, after washing it well, is siliceous and argillaceous earth. These are separated by agitation, allowing the siliceous part to settle, which it does in a few seconds. The alumina is poured off with the water, filtrated, heated over the lamp, and weighed,—the same with the siliceous sand. The loss of weight is calcareous earth. In this manner, but with greater care and more accurate tests, various soils of known fertility have been analyzed, of which we will give a few examples.

A very rich soil near Drayton, Middlesex, examined by Davy, consisted of $\frac{1}{2}$ of siliceous sand and $\frac{1}{2}$ of impalpable powder, which, analyzed, was found to be composed of

	Parts.
Carbonate of lime	28
Siliceous earth	32
Alumina	29
Animal and vegetable matter	11
	100

This is a rich sandy loam, probably long and highly-manured, fit for any kind of produce, and, if deep, admirably fitted for fruit trees.

Another good turnip soil, by the same, consisted of 3 parts of coarse siliceous sand, and 1 of fine earth, which being analyzed, consisted of

	Parts.
Carbonate of lime	63
Silica	15
Alumina	11
Oxide of iron	3
Vegetable and saline matter	5
Water	3
	100

This is a very light sandy soil, and owes its fertility to the fine division of the carbonate of lime and the vegetable and saline matter. It may probably have been limed or marled at some time or other.

The best loam in France, according to Mr. Tillet, consists of

	Parts.
Fine siliceous sand	21
Coarse ditto	25
Carbonate of lime	37.5
Alumina	16.5
	100

A loam at Chamart, highly prized by gardeners about Paris, as the basis of their artificial soils, consists of

	Parts.
Argillaceous sand	57
Finely divided clay	33
Siliceous sand	7.4
Carbonate of lime, coarse	1
Ditto, fine6
Woody fibre5
Humus and soluble matter5
	100

The argillaceous sand is composed of fragments of soft stone, which retain moisture, and do not bind hard: the small proportion of humus is of no consequence when manure is to be had in any quantity.

A very rich heath or bog earth found at Meudon, and in great request for flowers and in composts, consists of

	Parts.
Gritty siliceous sand	62
Vegetable fibres partly decomposed	20
Humus	16
Carbonate of lime8
Soluble matter	1.2
	100

This soil, like our bog earth, would be very unfit for the growth of corn; but, from the quantity of humus and vegetable matter, is highly useful in composts and artificial soils; mixed with lime, it would make an excellent top-dressing for moist clay soils.

Mr. Thaer has given a classification of soils of known qualities, which, we think, worthy of notice. It is as follows:—

No		Clay, p. cent.	Sand, p. cent.	Carb. of Lime, p. cent.	Humus, p. cent.	Value.
1	First class of strong wheat soils . .	74	10	4½	11½	100
2		81	6	4	8½	98
3		79	10	4	6½	96
4		40	22	36	4	90
5	Rich light sand in natural grass . .	14	49	10	27	?
6	Rich barley land .	20	67	3	10	78
7	Good wheat land .	58	36	2	4	77
8	Wheat land . .	56	30	12	2	75
9	Ditto	60	38	Very insignificant quantities.	2	70
10	Ditto	48	50		2	65
11	Ditto	68	30		2	60
12	Good barley land .	38	60		2	60
13	Ditto second quality	33	65		2	50
14	Ditto	28	70		2	40
15	Oat land	23½	75		1½	30
16	Ditto	18½	80		1½	20

Below this are very poor rye-lands.

In all these soils the depth is supposed the same, and the quality uniform to the depth of at least six inches; the subsoil sound, and neither too wet nor too dry.

Nos. 1, 2, and 3, are alluvial soils, and from the division and the intimate union of the humus, are not so heavy and stiff as the quantity of clay would indicate.

No. 4 is a rich clay loam, such as is found in many parts of England, neither too heavy nor too loose,—a soil easily kept in heart by judicious cultivation.

No. 5 is very light and rich, and best adapted for gardens and orchards, but not for corn; hence its comparative value can scarcely be given.

Nos. 6, 7, 8, are good soils; the quantity of carbonate of lime in No. 8 compensates for the smaller portion of humus. This land requires manure, as well as the others below. In those from No. 9, downwards, lime or marl would be the greatest improvement. Nos. 15 and 16 are poor light soils, requiring clay and much manure. But even these lands will repay the cost of judicious cultivation, and rise in value.

The last column, of comparative value, is the result of several years' careful valuation of the returns, after labour and seed had been deducted.

Few soils in England contain more than 4 or 5 per cent. of humus, even when in very good heart; and 2 per cent., with a good loamy texture, will render a soil fit for corn with judicious cultivation. The texture is of most importance, as may be seen by comparing Nos. 7 and 8 with No. 6. If this is of good quality, dung will soon give the proper supply of humus.

The depth of the soil and the nature of the subsoil greatly

affect its value. However rich it may be, if there is only a thin layer of good soil over a sharp gravel or a wet clay, it can never be very productive: in the first case, it will be parched in dry weather; and in the latter, converted into mud by every continued rain. If the subsoil be loam or chalk, six inches of good soil will be sufficient. With a foot of good soil, the subsoil is of little consequence, provided it be dry, and the water can find a ready outlet. The best alluvial soils are generally deep, the chalky shallow.

The exposure, with respect to the sun, and the declivity of the ground, are very important circumstances, and equivalent to an actual difference in the climate. A gentle declivity towards the south, and a shelter against cold winds, may make as great a difference as several degrees of latitude; and in comparing the value of similar lands in different climates, the average heat and moisture in each must be accurately known. A soil very fertile in the south of Europe may be very unproductive in England; and a light soil of some value in the west of Scotland might be absolutely barren in Italy or Spain.

Of the Cultivation of the Soil.—The better the soil, the less cultivation it requires to produce tolerable crops; hence, where the land is very rich, we find in general a slovenly culture; where the ground is less productive, more labour and skill are applied to compensate for the want of natural fertility. The simplest cultivation is that of the spade, the hoe, and the rake,—and on a small scale it is the best; but spade husbandry cannot be carried to a great extent without employing more hands than can be spared from other occupations. The plough, drawn by oxen or horses, is the chief instrument of tillage, and has been so in all ages and nations of which we have any records. Its general form is familiar to every one, and requires no minute description. The various kinds of ploughs in use at different times, and the improvements which have been made, and are attempted daily, will be noticed in a separate article [see PLOUGH]. Suffice it to say, at present, that a plough should as much as possible imitate the work done with a spade. It should cut a slice from the land by its coulter (a) vertically, and by the share (b), horizontally lift it up, and turn it quite over by means of the mould-board (c); and the art of the ploughman consists in doing this perfectly, and with such a depth and width as suit the soil and the intended purpose. In rich mellow soils a ploughed field should differ little from a garden dug with the spade. In tenacious soils, the slice will be continued without breaking, especially if bound by the fibres and roots of plants; the whole surface will be turned over, and the roots exposed to the air: it is of great consequence that each slice be of the same width and thickness, and the sides of it perfectly straight and parallel. The plane of the coulter must be perfectly vertical, and that of the share horizontal, in order that the bottom of the furrow may be level, without hollows or *baulks*, which are irregularities produced by the rising or sinking of the plough, or in clining it to either side. The antients were very particular in this respect, and recommended sounding the earth with a sharp stake, to ascertain whether the ploughman had

A A. The handles, or stils.
f. The hook to draw by.

[Plenty's Improved Flemish Plough, with one wheel and skim coulter.]

This plough differs from the common swing plough, in having a small wheel (*h*) by which the depth of the furrow is more easily regulated,—and a skim coulter (*i*), which pares off the grass and weeds and turns them into the bottom of the furrow; it is also broader at the point. It is suited to light friable soils.

done his duty. There are various modes of ploughing land, either quite flat, or in *lands* or *stitches*, as they are called in England, and, in Scotland, *riggs*, that is, in portions of greater or less width, with a double furrow between them—somewhat like beds in a garden. Sometimes two ridges are set up against each other, which is called *ridging* or *boulting*; the land then is entirely laid in high ridges and deep furrows, by which it is more exposed to the influence of the atmosphere, and kept drier; this is generally done before winter, especially in stiff wet soils. Sometimes two or more ridges are made on each side, forming narrow stitches. When the ground is to be ploughed without being laid in lands or stitches, and all the ridges inclined one way, the mould-board of the plough is shifted at each turn from one side to the other. The plough which admits of this is called

a *turn wrest plough*, and is in general use in Kent, and in many parts of the continent, where the subsoil is dry and the land not too moist. In most other situations the ground is laid in *lands*, and the mould-board of the plough is fixed on the right side. When grass land or stubble is ploughed, care must be taken to bury the grass and weeds completely, and the slice cut off by the plough must be turned over entirely, which is best done by making the width of the furrow greater than the depth. When the grass and weeds are rotten, and the ground is ploughed to pulverize it, a narrow deep furrow is best; the earth ploughed up is laid against the side of the preceding ridge, which forms a small furrow between the tops of the ridges, well adapted for the seed to lodge in and to be readily covered with the harrows.

[Plenty's Common Rhomboidal Harrow.]

Nothing has divided both practical and theoretical agriculturists more than the question whether the land should be ploughed deep or shallow; but a very slight attention to the purposes for which land is ploughed, and to the nature of the soil, will readily reconcile these apparently contradictory opinions. A deep, rich, and stiff soil can never be moved too much nor too deep: deep ploughing brings up rich earth, admits the air and water readily, and gives room for the roots to shoot, whilst the rich compact soil affords moisture and nourishment. Wherever trees are to be planted, the ground should be stirred as deep as possible, even in a poor soil: for grass and corn, this is not always prudent; their roots seldom go above three or four inches deep, and if they find sufficient moisture and humus, they require little more depth.

Whenever the soil below a certain depth is of an inferior quality, there can be no use in bringing it up; and where the soil is light and porous, the bottom had much better not be broken. Norfolk farmers know this well, and are very careful not to break the *pan*, as they call it, in their light lands: this *pan* is formed by the pressure of the sole of the plough and the tread of the horses, and opposes a useful bank to the too rapid filtration of the water;

it lies from five to eight inches below the surface. If it is broken, the manure is washed down into the light subsoil, and the crop suffers, especially when sheep have been folded, their dung being very soluble. In such soils an artificial pan may be formed by the *land-presser* or *press-drill*. This instrument consists of two very heavy cast-iron wheels, *a a*, with angular edges, set on an axle, at a distance from each other equal to the width of the furrows, and a lighter wheel, *b*, to keep the instrument vertical.

It is drawn by a horse immediately after the plough, pressing two furrows at once, and going twice over each furrow. It leaves the land in regular drills, and the seed sown by hand falls into the bottom of the drills, and is covered by the harrows. When the plants come up they appear in regular parallel rows.

The great object in ploughing land is to divide it, expose every part of it to the influence of the elements, and destroy every plant or weed but those which are sown in it. To do this perfectly requires several ploughings, with certain intervals, and during that time no crop can be upon the land. This is the real use of fallows, and not, as was once supposed, to allow the land to rest; on the contrary, it ought then to have the least repose.

[Plenty's Press Drill or Land-Presser.]

Where the soil is good, with a porous subsoil, the greatest care should be taken not to go too deep; but where the subsoil is compact and impervious to water, but not wet for want of outlet or draining, it is useful to stir the soil to a great depth, but without bringing it to the surface, which may be done by a plough without a mould-board following a common plough in the same furrow. This is an excellent mode of draining, and at the same time keeping a reservoir of moisture, which in dry weather ascends in vapours through the soil and refreshes the roots.

The mode in which the soil is prepared most perfectly for the reception of the seed is best shown by following the usual operations on fallows. After the harvest, the plough is set to work, and the stubble ploughed in. The winter's frost and snow mellow it, while the stubble and weeds rot

below. In spring, as soon as the weather permits, it is ploughed again, the first ridges being turned over as they were before: this completes the decomposition of the roots and weeds. It is then stirred with harrows, or other instruments, which tear up the roots which remained, and some of these, not being easily destroyed, are carefully gathered and burnt, or put in a heap to ferment and rot, a portion of quick lime being added. Another ploughing and stirring follows, at some interval, till the whole ground is mellow, pulverized, and free from weeds; manure is put on, if required, and immediately spread and ploughed in; the land is then prepared for the seed.

This has been the method universally followed by all industrious husbandmen from the oldest times. The Romans had names for each of the ploughings: the first was *fringere*,

Fig. 5.

[Plenty's Scarifier.]

the next *vertere*, the third *refringere*, and the fourth *revertere*; more ploughings were often given, and in modern agriculture the direction of the third ploughing is sometimes changed across the old furrows, at a right, or acute angle, as Virgil recommends (*Georgica*, i. 98), by which the earth is still better divided and mixed.

Various instruments have been invented to stir the earth and mix it, without so often using the plough, and also to loosen and separate roots and weeds; of these the principal are, the cultivator or scarifier, which enters but a few inches into the ground, and moves a great surface by means of tines, or iron teeth of various constructions. The whole instrument is made of iron: *a a* is the frame; *b*, the beam; *c*, rods by which it is drawn, the horses being attached by a hook at the point *d*; *e e*, the handles; *f f f*, different shaped shares and tines to be used according to the state of the soil; *g g g*, contrivances by which the teeth are fixed to the frame at any required distance from each other, and lengthened or shortened; *h h h*, three wheels to regulate the depth of the ground moved. By raising the beam and

fixing it higher or lower on the piece (*i*), by means of an iron pin passed through the different holes, the whole instrument is raised or depressed in the ground.

This instrument divides the soil, but does not turn it over; it is well calculated to destroy roots and weeds, and let in the air; but, evidently, is only adapted to tolerably loose and mellow soils, where there are no large stones.

An ingenious harrow or cultivator has been invented by Finlayson, which rakes the weeds out of the ground, and throws them on the surface without clogging the instrument; it is excellent in light soils.

When the soil turned up by the plough is in large hard lumps, a roller, sometimes with spikes in it, is drawn over the land to break the clods, or mallets are used to break them by hand; but this is seldom necessary except where very stiff soils have been ploughed when too wet, and the ridges have dried, and been ploughed again in dry weather. Deep wet clay soils should be carefully watched, to know when is the proper time to plough them; nothing pulverizes them like frost, and if they are kept from wet by

[Finlayson's Patent Harrow.]

a, a, The iron frame.
c, c, c, Three small wheels, of which the foremost is brought forward by depressing the lever *d*, and raising the teeth out of the ground.
a, Is a contrivance to keep the lever, *d*, in any required position, so as to regulate the depth to which the teeth, *b, b*, enter the ground.
f, Is the hook by which the instrument is drawn.

careful draining and numerous water furrows in autumn, they will be loose and friable in spring; they had better not be touched than worked when too wet. On light soils the plain roller is used to advantage to produce firmness, without which the plough cannot so well turn the ground over completely, but merely pushes it to the right and left.

The great expense of teams for the plough has led to expedients and inventions to lessen the labour, but, in general, a more imperfect cultivation has resulted from it. Columella mentions one Celsus, whom he blames, because, to 'save the expense of a stronger team, he only scratched the ground with small shares and toothed instruments (*exiguus vome-*

throve well as long as the supply lasted: but in the end it was exhausted; and the warmest admirers and supporters of Tull's system, Du Hamel and De Chateauxvieux, besides many others, found to their cost, in practice, that pulverizing alone will not restore fertility. The system of drilling and horse-hoeing, when united with judicious manuring, has, however, been found a great improvement in agriculture.

In describing the various processes in general use in the cultivation of the soil, we have taken the year when the land is fallowed, because it is then that it receives the most perfect culture, which enables it to produce several crops afterwards with a much smaller quantity of labour. By such fallowing and proper manuring, the soil is fully restored to its highest degree of fertility. In light soils, which are generally poorer, turnips or other green crops are sown, on which sheep are folded, who, by their manure, still more enrich the soil, and it is only when this manure is ploughed in, that the land may be considered as possessing the proper degree of fertility.

There are some soils which are so mixed with pebbles and stones, that the foregoing observations will scarcely be applicable, and the instruments must be adapted to their texture. Some of these soils, abounding with chalk, are tolerably fertile, and the stones, when they are not so large as to impede the operations, are rather beneficial than otherwise. Theophrastus mentions a field which had been deprived of its fertility by the removal of the stones, and others have learned the same from experience. Pebbles prevent too great evaporation, shelter the young plants in exposed situations, and reflect the light and heat of the sun. The only inconvenience found from them in good soils is that they occupy the room of better earth, and wear out the instruments used, which, in consequence, are made stronger and blunter. When there is a crop to be mown with the scythe, the stones must be removed from the surface, but not otherwise, at least in light soils.

When the land has been duly prepared, the seed is sown. This is done sometimes before the last ploughing, but then

Fig. 7.

[Roller.]

ribus et dentalibus); and a modern agriculturist of some note has revived the practice of Celsus. General Beaton, who had been in India, and had seen the simple instruments used there by the natives, has substituted for the plough and cultivators in common use, various light instruments, of which he has published an account. He recommends stirring the soil only a few inches deep, except occasionally; and, by means of burnt clay, which he uses in great abundance, he has produced a succession of good crops: but he has too high an opinion of the fertilizing qualities of burnt clay, which makes him undervalue animal and vegetable manure; and although he may improve the texture of his heavy soil by the burnt clay, which is insoluble and absorbent, he will soon find out, like the followers of Tull, that manures which contain soluble extract, or from which it can be formed, can alone maintain fertility.

The influence of the atmosphere on the soil, and the increased fertility produced by pulverizing and stirring heavy lands, has led to the notion adopted by Jethro Tull, that labour might entirely supersede the necessity of manure: hence the origin of the horse-hoeing husbandry, which at one time was so highly thought of as to be called, by way of distinction, the *new* husbandry. Fallows and manuring were both discarded as unnecessary; the seed was sown in rows with wide intervals, which were continually kept worked and stirred. At first the result was highly satisfactory; all the humus, by exposure to the air, was converted into soluble extract, and taken up by the plants, which

Fig. 8.

the manure should have been ploughed in before; for, except in planting potatoes, which are not a seed, but a bulb, the manure should always be deeper, and not in contact with the seed. When the seed is ploughed in, the furrow should not be above two or three inches deep, and eight or nine wide; and it is only in particular soils that this mode is to be recommended. The most common method is to sow the seed on the land after the last ploughing, and draw the harrows over to cover it: when the land has been well ploughed, and especially if the press-drill has followed the plough, the seed will mostly fall in the small furrows made by two adjoining ridges, and rise in regular rows. But by far the most perfect way is, to sow it at a regular depth, by means of a machine, and in rows at regular distances [see

DRILL], or to *dibble* it, which is an operation performed only in a few parts of England, especially in Suffolk, Essex, and Norfolk. A man makes small holes at the distance of four or six inches, and in rows nine to twelve inches asunder, with two rods about thirty inches long, one in each hand, having an oval ring for a handle at one end, and, at the other, an inverted cone three inches in the axis, and one and a half inch diameter at the base, which he pushes and turns with his hands in the ground to prevent the earth adhering, and makes the holes rapidly going backwards along the furrows; two or more children follow and drop three or four grains in each hole; a bush-harrow is drawn over the ground, and fills the holes with loose earth; when the corn comes up, it looks like a regular plantation.

[Bush-Harrow.]

The proper season for sowing each kind of grain, the choice of seed, and other particulars, will be given under the name of the different seeds usually sown. As a general rule, it may be observed, that the smaller the seed, the less it must be covered, and clover or grass seed are not usually harrowed in, but only pressed in with the roller.

Of the succession of crops or rotations.—It has been found by experience, that besides the general exhaustion of humus produced by vegetation, especially by those plants which bear oily or farinaceous seeds, each kind of crop has a specific effect on the soil, so that no care, or manure, can make the same ground produce equal crops, of the same kind of grain, for any length of time without the intervention of other crops. Whether this be owing to any peculiar nourishment necessary to each particular kind of plants, or because plants not indigenous degenerate in a foreign soil, the fact is certain with respect to most crops usually raised, and particularly red clover. This points out the advantage of varying the crops, according as they are found to succeed best after each other. In general, all kinds of grain succeed best after a crop which has been cut before the seed has ripened, or the stem is dried up. Those plants which have a naked stem with few leaves thrive best after leguminous plants, which have more succulent stems and more leaves, and which bear their seeds in pods, as peas, beans, tares or vetches; or after esculent roots, which strike deep into the ground, as carrots, parsnips, beet-roots, and turnips. From this circumstance, confirmed by universal experience, the different systems of rotation have had their origin, taking the nature of the soil into consideration.

The simplest rotation, and one which can only be adapted to the richest strong alluvial soils, is that of wheat and beans, alternately, and without any intermission. It is in use in some parts of Kent and Essex, and in a few places in Germany. The land is well prepared and manured for the beans, which are set or drilled in rows, so as to admit of horse-hoeing between, as in Tull's method, till the beans get to a considerable height; besides this, careful hand-hoeing and weeding are practised, by which the land is cleaned and stirred as in a regular fallow. The beans being cut, the ground is ploughed once, and the wheat sown. It is the practice in some places to scarify the land immediately after harvest, to cut up the stubble. It is done in Kent with a plough without a mould-board, and with a very broad share, hence called *broad-sharing*, but most usually by the scarifier mentioned before: the stubble and weeds, if any, are raked up and burned: this is an excellent practice. Another equally simple rotation, on very poor light land, is that of turnips and barley alternately, which is mentioned by Arthur Young as being in use in the county of Durham, with the simple variation of clover occasionally. The turnips are always fed off by sheep folded on them. Where winter food for the sheep is scarce, this rotation may answer, but otherwise cannot be very profitable.

The oldest rotation known, and which was almost universal in Europe, from the time of the Romans, wherever any regular system of agriculture prevailed, is the triennial rotation of fallow, winter corn, and summer, or lent corn; that is, wheat or rye sown in autumn, and barley or oats sown in spring. This was called the three-field system; and on every farm, the arable land was divided into three parts, one of which was in fallow, one in winter corn, and one in summer corn. When properties were much intermixed and subdivided, the whole of a considerable tract was divided into three fields, and it was almost impossible for any individual to deviate from the established course; especially as a right frequently existed of pasturing all the sheep of the parish or district on the fallow field in summer, and on all the others after harvest. In England, this impediment was removed by the legislature passing acts of inclosure; but it is still felt in many parts of the Continent. This rotation had its advantages, or it could never have been so long in use. Where a sufficient quantity of manure could be collected by means of cattle fed on pastures and commons in summer, and in the strawyard in winter, to give a regular dressing to the fallows every third year, good crops were produced, and the fertility kept up. The labour was very equally divided throughout the year; and such was the regularity of every operation, that a large quantity of land might be cultivated by a proprietor at a considerable distance, with only occasional inspection, without an overseer or bailiff, provided he had honest servants. But, when pastures came to be broken up, and converted into arable land, and cattle consequently diminished, the land could not be manured on every fallow; the crops suffered; less straw being grown, the quantity of manure was diminished, and the land became gradually less and less productive, till, from necessity, a portion was left uncultivated, and returned to natural and inferior pasture; this gave the idea of laying the land down regularly to grass by sowing seeds, and gradually introduced the alternate and convertible system of which we will take notice hereafter.

The apparent loss of a third part of the land by the fallows introduced various crops, which were supposed not to exhaust the soil, but rather to enrich it: of this kind, one of the first was clover, introduced by the Flemish; and afterwards turnips, which have been found of such importance in light soils and moist climates. By substituting turnips for an entire fallow, or, more properly, sowing them early on the regular fallow, and interposing the clover between the summer and winter corn, the highly-improved Norfolk rotation has been obtained, viz. 1. Turnips, well manured. 2. Barley. 3. Clover. 4. Wheat, by which a sufficiency of food for sheep and cattle is obtained, without natural pastures, and the land, manured every fourth year at least is kept in a regular state of progressive improvement. The advantages of this rotation have made it a condition in many leases of light land, under heavy penalties in case of deviation. The first and principal inconvenience

found in it was the failure of the clover in most soils, if sown every fourth year; this obliged the farmer to have recourse to other less profitable crops, such as ray-grass, peas, or tares, which, in light lands, are not equal to broad clover as a preparation for wheat. Where the soil is firm and rich, and at the same time mellow, a rotation may be introduced, compounded of the first and last mentioned; that is, beans, wheat, turnips, barley, clover, wheat, making a rotation of six years. This can only be introduced with advantage where there are considerable pastures, and much cattle is kept to supply manure for the land *twice* in the rotation, viz., for the turnips and for the beans, and where the drill husbandry admits of hoeing and weeding thoroughly; but with these advantages, no course can be more profitable, as is found in those parts of Kent and Essex where marsh pastures are attached to the farms. If the soil is too heavy and wet for turnips, and they cannot well be drawn off nor fed on the land, without injuring it, a clean fallow is substituted for the turnips, the other crops remaining the same; or cabbages are planted for the cattle, but seldom to a great extent. A long fallow from after harvest until the second spring, including two winters, prepares the land admirably for barley, so that it can be sown without any manure, which is reserved as a top-dressing for the young clover after the barley. This is a very excellent method. The clover or ray-grass will be more abundant, and the wheat after it will not be in danger of running to straw, or lodging, that is, falling down for want of a sufficient hold of the ground by the roots.

These rotations are sufficient to give some idea of the principles on which they have been adopted. In Scotland they adhere less strictly to particular rotations, nor are the tenants in general so much tied down as in England; seasons and circumstances cause deviations, which are sometimes judicious and often unavoidable. It is best, however, to follow some regular course, and in the end it will be found most profitable. A very common rotation in Scotland is fallow, wheat, clover, or grass, fed one, two, or three years, then oats, peas, or beans, and wheat again, if the land is clean and in good heart: for there is no rule better established, than that of never allowing the soil to be exhausted beyond a certain point, where manure and tillage can readily recruit it. The greedy cultivator is sure to pay dearly in the end for every crop forced from the land unreasonably.

Without preventing the tenant from using his discretion as to the mode in which his farm is best cultivated, a proprietor may be sufficiently protected against wanton deterioration of the land, by insisting on a green crop or fallow intervening between every two crops of grain, and consuming all the fodder and roots on the farm. For this subject we must refer to the article *FARM*. A proprietor with skill and experience, cultivating his own land, need only consider the state and quality of his fields, and what will most likely grow well in them; what is most in request, both for his own use and in the market; what will keep his men and cattle in most regular work, without confusion or hurry. If he allows his land to be impoverished for want of manure, or to run wild with weeds, for want of hoeing or fallowing, he has not the experience and judgment which are necessary for his pursuits.

The Flemish husbandry proceeds much on this principle. The greatest attention is paid to manuring and weeding. Much more manual labour is bestowed than with us, and the crops seem more certain, varied, and abundant. That it is not unprofitable we may conclude from the wealth of the peasants, the comfort of the labourers, and the sleek appearance of the cattle. From the very interesting account of Flemish agriculture in the work of Mr. Van Aelbroek of Ghent, written in Flemish, translated into French, and published at Paris in 1830, we learn with what great care the soil is cultivated in Flanders. After ploughing into lands as we do, every intervening furrow is deepened and cleared with the spade, the earth being thrown over the bed sown. Liquid manure (which is sadly thrown away in this country), chiefly the urine of animals and drainings of dung-hills, is carefully collected, and is carried on and distributed over the poor light soils, by means of water-carts, before sowing, and again when the crop is come up. By this means such lands are made to yield crops of rape seed, clover, lucern, flax and corn, equal in luxuriance to those on the richest soils. Fallows are rendered unnecessary by the careful destruction of weeds. In short, it is a garden

culture on an extended scale. All the land is in tillage, except where rivers occasionally overflow, and render the meadows rich and profitable. The cattle are mostly kept in stables, and fed with green food cut and brought to them: by which means one acre of clover, lucern, or other artificial grass, will maintain five times as many beasts, or more, as an acre of the best pasture: but the great object is to increase manure, especially in a liquid state, which is carefully preserved in reservoirs, without loss or waste, till wanted for the land. This system is also followed in Switzerland, which, considering its soil and climate, is one of the best cultivated countries in Europe.

We observed before, that the want of a sufficient supply of manure on the old three-field system led to the laying down arable land to pasture for a time and then breaking it up again. This was first practised in a regular rotation in Holstein and Mecklenburg, and raised these countries rapidly amongst agricultural nations.

In Holstein, on moderately good soil, they adopt the following course:—1. Oats, on newly broken up grass land. 2. A fallow to destroy grasses and weeds, and accelerate the decomposition of their roots. 3. Wheat with or without manure, according to the state of the land. 4. Beans, barley, or oats. 5. Wheat, manured, unless it has been done for the beans the year before. 6. Grass seeds pastured for three years or more, when the rotation begins again.

A Mecklenburg rotation, not unlike the Scotch, consists of,—1. Beans well manured, or potatoes. 2. Wheat or oats. 3. Barley or oats, unless sown the year before. 5. Peas or tares, manured. 6. Wheat. 7. White clover and grass seeds, which were sown among the wheat the year before, and are kept in pasture the 8th and 9th. There is no fallow, and in a moist climate it will be difficult to keep the land clean. It might, however, easily be introduced, as in the Holstein rotation.

Another rotation is,—1. Oats. 2. Beans well manured. 3. Wheat. 4. Tares manured. 5. Barley. 6. Clover and grass seeds mown for hay and green fodder; 7 and 8 ditto, fed. All these are excellent for a moderately good soil well managed. If the soil is very rich, the following is the most profitable of any:—1. Rape seed well manured. 2. Wheat. 3. Beans or potatoes manured and hoed. 4. Barley. 5. Clover. 6. Wheat. 7. Oats with white clover and grass seeds pastured two or three years. The principal object in this convertible system is to lay the land down in good heart, and as clear of weeds as possible: the grass will then be abundant, and continue good for several years. Liquid manure, carried upon it in spring, will so enrich it as to admit of making the crop into hay, or cutting it green for the cattle in the stables. In light soils, the tread of sheep and cattle is of great use; in heavy, wet soils, they would do harm. No wet land will bear this rotation.

We have now given a brief outline of the manner in which arable land may be cultivated and improved. If we should be asked, whether so much attention and labour upon land of a proper quality will be repaid by the value of the produce, after deducting the portion due to the landlord or to the state? we shall answer, without any hesitation, in the affirmative, provided the cultivator is possessed of knowledge, judgment, and experience, and devotes all his time to the superintendence of his farm. The calculations on which this opinion is founded cannot be introduced here: some idea of them will be given in the article *FARM*. Agriculture is so healthy, so agreeable, and so moral an occupation, that it can never be extremely profitable: the competition for land will always prevent this. The butcher and cattle-dealer will always, if successful, make far greater profits than the farmer; and a decent livelihood, with a moderate interest on the capital laid out, is the most that a farmer can expect, even with the greatest assiduity. If he neglects his business, and leaves it to others less interested in the result, he must be a loser. Gentlemen who cultivate for pleasure, and employ bailiffs, are fortunate if they get a moderate rent after paying expenses. For careless farmers, the simplest system alone can prevent great loss: and grass land may be profitable in the hands of a proprietor, who would probably be ruined if his land were all arable and in his own hands.

Our limits will not permit us to enter into the important subject of improvements,—nor into the question of great or small farms, as most beneficial to the community:—these and various other branches of the subject will be found under proper heads; such as *BARREN LAND*, *FARM*.

DRAINING IRRIGATION, MANURE, LABOUR, GRASS-LAND, CATTLE, &c.; and for the peculiar cultivation of the various products of agriculture, see WHEAT, BEANS, BARLEY, CLOVER, OATS, PEAS, &c. &c.

We shall only add the names of a few authors whose works may be studied and consulted with advantage, by all those who desire to have a competent knowledge of agriculture, either as a branch of general knowledge, or for the purpose of its practical application.

Of the Greek writers on husbandry we have hardly anything left, except in the collection of Cassianus Bassus, entitled *Geoponika* (earth-labouring). This collection, in twenty books, was made at the command of the Emperor Constantinus Porphyrogenetus, and was chiefly compiled from Greek writers, whose names are given. We are not aware that there is any foreign translation of the *Geoponika*, except the old German version of *Herren*, first printed at Strasburg in 1545, 4to. The Latin writers, Cato, Varro, Virgil in his *Georgics*, Columella, and Palladius, are well known: their works, especially the last two, will be found to contain many valuable remarks; and abridged translations of them, or extracts, would be very useful even to modern agriculturists. Of the above, the following have been translated by the Rev. T. Owen, rector of Upton Scudamen, Wilts:—1. *The Three Books of M. Terentius Varro, concerning Agriculture*. London, 1800. 8vo. 5s. 6d. 2. *The Fourteen Books of Palladius on Agriculture*. London, 1807. 8vo. 8s. The same author has also published *Agricultural Pursuits, translated from the Greek*. London, 1805, 2 vols. 8vo. 15s. Of the earlier English writers, we shall only mention Fitzherbert, Blythe, Hartlib, and Weston. Afterwards came Evelyn, Tull, Hale, and the great oracle of modern husbandry, Arthur Young; with Sir John Sinclair, to whom, as President of the Board of Agriculture, much useful information was communicated, which he industriously compiled. (Sinclair's *Account of Systems of Husbandry, &c.*, 2 vols. 8vo.) The Surveys and Reports on the agriculture of the different counties, prepared for the Board of Agriculture, are replete with useful information as to what is the actual practice; and among a multitude of agricultural publications, journals, and proceedings of societies, we may notice Loudon's *Encyclopædia of Agriculture*, as a useful book of reference.

The French are rich in elementary works, among which the *Théâtre d'Agriculture*, par Olivier de Serres, is a standard work. It was written at the express desire of Henry IV. and his minister Sully, and published in 1600; the last edition, in four volumes quarto, Paris, 1804, with numerous additions, and the *Cours Complet d'Agriculture*, by various members of the Institute of France, published in 1820, contain everything that was then known of the science of agriculture. A little work of much merit may be mentioned, called *Le Manuel Pratique du Laboureur*, by Châmbouillé Dupetitmont, Paris, 1826, two volumes, duodecimo; and also *Le Calendrier du bon Cultivateur*, par C. I. A. Mathieu de Dombasle (on the plan of Arthur Young's *Farmer's Calendar*), Paris, 1833, duodecimo, is a very useful work. Innumerable works on particular branches, and the annals and memoirs of various agricultural societies, appear daily. Among the German authors we shall only mention Thier, whose works we have quoted above, and which form a most complete body of theoretical and practical agriculture: his experiments made on a large scale at the national farm of Mögeln near Frankfort on the Oder, and repeated for many years, can be fully depended upon. We have also quoted the work of Mr. Van Aelbroek, *De l'Agriculture Pratique de la Flandre*, Paris, 1830, octavo, as a useful and interesting work.

ARABS' GULF, a bay on the north coast of Africa, lying between Alexandria and some point west of Alexandria, which is not well defined. Ras-el-Kanyis, 115 miles west of Alexandria, is the first very salient point as we advance westward.

The bay called *Plinthinètes* (Herod. ii. 6) corresponded to, or formed a part of, the Arabs' Gulf.

ARACAN, or **RAKHAIN**, is a country of Asia, lying on the eastern shore of the bay of Bengal, and forming the westernmost part of the Peninsula beyond the Ganges. It extends from 20° 46' to about 18° N. lat., and lies between 92° and 95° E. long. Its extreme length from N.N.W. to S.S.E. may amount to upwards of 230 miles, and its average breadth to about 50 miles. Its surface is estimated to contain 11,500 English square miles, so that it exceeds the principality of Wales by more than 3000 miles.

It is bounded on the east by a range of mountains, which separates it from the Burmese empire, from which it is also divided on the south by a small mountain-river. On the west it extends to the bay of Bengal, and on the north to Chittagong, a province of Bengal, and to the mountainous and woody tract which extends between Chittagong and Muneepoor. It is separated from Chittagong by the river Naf, or Nauf.

This country, which in 1826 was acquired by the East India Company from the Burmese, contains three districts, Proper Aracan, or Akyab, Sandoway, and Ramree.

Aracan Proper consists of a valley stretching nearly parallel to the shore, between a range of mountains and a ridge of hills. The mountain-range which divides it on the east from Ava is called Yeomadong by the Aracanese, and Anapectomi by the Burmese: it extends from Cape Negrais (16° 2' N. lat.) to the Tipperah Hills lying east of Dacca in Bengal, which, together with the hills bounding Silhit on the south, may be considered as the northern extremity of this range. Its mean elevation is about 3000 feet above the level of the sea, though, in some parts, it attains the height of 5000 feet. On the east, or towards the Irrawaddy in Ava, it declines by a succession of ranges; but towards Aracan its descent is steep and abrupt. Several passes conduct over these mountains to Ava, but only two can be passed with ease.

The heights which extend along the Bay of Bengal at no great distance from the shore and separate the valley from the sea, do not, probably, rise to more than 700 feet. They generally assume a conical shape, and do not form a continual range; some are insulated, others connected by narrow ridges, but all are scattered in an irregular manner and separated by many ravines, valleys, and confined level spots, each occupied by a stream, a lake, or a marsh. On the shore they are intersected by many rivers, creeks, and inlets of the sea, so as to form a series of peninsulas, isthmuses, and islands, by which the land communication is completely interrupted. The coast is fringed by numerous islands, moderately high and thinly inhabited.

The valley, which lies between the two ranges, varies in breadth: in some parts the hills advance from the shore so far to the east as to narrow it to 10 miles, and even less, whilst in other places they leave a space of 40 miles between them and the mountains. This valley is so little above the level of the sea, that the tide, which in the straits, rivers, and harbours rises 14 feet at full and change, inundates the flat borders of the rivers to a considerable extent, and its ebb converts them into a noisome swamp. With the exception of this swampy ground, the soil consists of rocks, crumbling on the surface, and covered by a thin layer of loose black soil. Where this layer has not been washed away by the rains, the country is covered with grass and jungle-shrubs. In July, when the periodical rains become very abundant, the whole valley is inundated, and resembles a channel of the sea, in which the few towns and villages appear like islands scattered in a large lake.

The small rivers which intersect this valley are so numerous as to form a complete labyrinth, one winding creek leading to another, so as to form an inland water-communication between the villages and towns for the greatest part of the year. Most of the small streams run to the northward, where the valley is lowest and broadest, and where the hills on the shore terminate, or rather leave a wide opening. Here they fall into a kind of bay full of islands of considerable extent, which seem to be low and partly uninhabited. This bay receives also the principal river of the country, the Keladyne or Huritung, which rises in the mountainous tract between Chittagong and Muneepoor, and may have a course of about 250 miles. The rivers, which, farther to the south, intersect the hills, as the Talak Keon and the Yanaway Keon, are small, but commonly navigable for boats eight or nine months in the year.

Many causes concur to render this ill-ventilated valley extremely unhealthy—the heat, the inundations, and the general moisture. Even in the dry season, in November, December, and January, occasional and sometimes heavy showers occur. In February, March, and April, they become more frequent, and still more in May and June, when the periodical rains set in and last till November. The rain in July amounts to nearly 60 inches, and in August to 43½. From the beginning of June to the end of September, it amounted, in 1824, to 196 inches, and then nearly the whole surface of the valley was under water. Heavy dews and

thick fogs prevail during the nights even in the dry season, and great heat in the day-time. The thermometer rises in July to 89°, and in August to 94°, and is never under 77° in these months.

The fertility of this country is very great, and its soil fit for the culture of nearly all tropical productions; but in the actual state of agriculture rice only is cultivated to any great extent. Indigo, cotton, and tobacco, as well as hemp, are also raised, and their culture has lately increased, but not so as to produce any for exportation. Sesamum and mustard-seed are cultivated, on account of the oil which is extracted from them and largely used. The sugar-cane grows very luxuriantly, and might be cultivated to a great extent. Black pepper of a good quality grows wild near Aeng, but it is nowhere cultivated. Fruit is plentiful and of excellent quality. The pine-apples and plantains are, perhaps, the finest flavoured in the world, and are produced in the greatest abundance. Mangoes, jack-fruit (*Artocarpus integrifolia*, Linn.), sweet limes, and cocoa-nuts are also plentiful, but oranges are scarce. Of the vegetables raised, the principal are onions, garlic, and turmeric; but bhanguans, red pepper, cucumbers, water-melons, papeyas, and raktalus are also abundant. No forest-trees grow in the valley, nor, as it seems, on the hills along the shore; but extensive forests of teak abound in the mountains at the sources and along the upper course of the Huritung; their great distance from the coast, however, and the want of roads prevent the people from bringing them to the more inhabited part of the country. This timber, therefore, is imported from Rangoon in Ava, or from Bengal. Other forest-trees abound in the same mountains and on the borders of Chittagong.

The zoology of this country is very little known. We learn only that the jungles abound in tigers and wild elephants, and that the latter are much more dangerous to the cultivated fields, than the former to the cultivators themselves. Of domestic animals only poultry and buffaloes are mentioned. The latter are most esteemed from their being docile and useful in cultivating and treading out rice. Silk is raised, but not enough for the consumption of the inhabitants. Bees abound in the country near the mountains. Fish is so plentiful that it not only supplies the principal food of the inhabitants, but also, when dried, an article for exportation.

Still less is known of its mineral riches. Silver, it is said, has been ascertained not to exist in the mountains, but there is iron-ore in abundance, and this is all we know. Salt is made in a great many places, and is an important article of exportation.

Aracan, 20° 43' N. lat. and 93° 31' E. long. the antient capital, is built on a plain entirely surrounded by hills, and intersected by several streamlets, which occasionally join each other or fall immediately into the river Huritung. One of these streamlets runs through the town and divides it into two parts connected by strong but clumsy wooden bridges. This stream ebbs and flows with the tide, and at high-water boats are able to navigate it. During the periodical rains the greater part of the town is inundated, and on this account here, as well as in the villages on the plain, the houses are raised upon piles or strong posts of timber, little more than four feet above the ground, that the water may have a free course under them. These houses, or rather huts, are miserable structures, only one story high, and thatched with straw or mats. They are ranged with considerable regularity in streets, the chief of which skirts the stream on each side. This town is about four miles in circumference, and of a quadrangular form. Before its occupation by the British troops (in 1824) it is said to have contained 13,000 houses and 95,000 inhabitants. Its actual population is not known, but it is certain that it has much declined since it has ceased to be the seat of the government of the country, which by the Company has been transferred to other places; and it is probable that at present it does not contain one-fifth of the number of inhabitants formerly assigned to it.

Within the town is a fort, a very antient building; the date of its erection is unknown. It is surrounded by three quadrangular concentric walls, each about 20 feet high and of considerable thickness. There are also four pagodas, built in the centre of the town on a hill about 100 feet high, and inclosed by a quadrangular wall. They contain numerous images of Gaudama, from one inch to twenty feet in height; but what renders them especially remarkable are some antient sculptures found in and about them, among which

some sphinxes are observed, which confirm the striking analogy between the hieroglyphics of Ava and Egypt observed by Symes. Except the fort, the pagodas are the only stone-buildings in Aracan.

The heights which surround the town are covered with pagodas, the gilt spires of which, shooting up like pyramids from every pinnacle around and glittering in the sun, contribute greatly to the singular and picturesque appearance of this place. Upwards of sixty of these temples, of various forms, may be counted at once.

Akyab, the capital of the district which comprehends Aracan Proper, has a good harbour, but is little frequented, on account of its unhealthfulness. Two other places are worth notice, *Talak*, on the Talak Keon, and *Aeng*, on the Yanaway Keon. Both are places of some commerce, and owe this advantage chiefly to their being situated where the roads traversing the mountains terminate, and on the banks of rivers navigable for boats from June to April. The country along these rivers is improving in cultivation.

The district *Sandoway* comprehends chiefly the mainland between 19° and 18° N. lat., and is a mountainous country, intersected by valleys running east and west. Not being exposed to inundations, nor subject to fogs, it is tolerably healthy, and enjoys a cool sea-breeze, with temperate nights, nearly through the year. Agriculture is increasing, on account of the neighbourhood of Kyouk Phyoo. The capital, Sandoway (18° 28' N. lat., and 94° 27' E. long.), lies on a navigable river, and is a thriving town.

The district *Ramree* contains the two large islands of *Ramree* and *Cheduba*, and several smaller ones. The island of *Ramree* is of considerable extent, and divided from the main land by a narrow but navigable channel. It consists of hills, intermingled with much level ground, and has generally a very fertile soil. Besides the common productions of the country, excellent oranges are raised; horticulture is improving, and the cinnamon tree, which lately has been introduced, promises very well. On the southern extremity of the island is a ridge of hills, among which are several volcanoes, reported to discharge flames occasionally and a quantity of iron pyrites, but in their tranquil state only a greasy mud bubbles up, mixed with a little petroleum.

Kyouk Phyoo (meaning *the white stones*, because small white pebbles are washed on the beach during the S.W. monsoon) is at present the capital of Aracan, and begins to be a place of some trade. It is situated at the northern extremity of the island of *Ramree*, on a beautiful plain, with much high land in its vicinity, which is covered with forest trees, yielding timber of superior quality for masts and yards, and perhaps for other naval purposes. The harbour is spacious and good, free from fogs, with abundance of water and fire-wood. Lately a few cargoes of rice and dried fish have been shipped from this place to the Mauritius.

At the south end of *Ramree* is a safe harbour, called *Ramree*, or *Amherst Harbour*.

The island of *Cheduba* is divided from *Ramree* and the main land by a channel some miles broad, and navigable, but no safe harbour is found on it. From north-west to south-east the island extends about twenty-one miles, by about fifteen miles in breadth. It is of moderate height, with several hummocks on it; its soil is excellent, and well watered by hill-streams, on the banks of which rice, tobacco, cotton, red pepper, hemp, and sugar-cane, are cultivated. But the larger part of the island is still covered with jungle. In 1827 it contained about 2300 houses, and 12,000 inhabitants. Here also are several volcanoes, mostly of the description called mud volcanoes, strongly impregnated with sulphur. They are worshipped by the inhabitants, who think them occasioned by the great naga or serpent which supports the world, and takes this method of giving vent to its agony.

The actual population of Aracan is stated to amount to little more than 200,000 inhabitants, but it seems somewhat under-rated, if it be true that 400 square miles of the country are under cultivation. The aborigines, who to all appearance form almost exclusively the population, are called *Mugs* by the inhabitants of Bengal, but their national name is *Yakain*, or *Ma-ran-ma*. They are short, squat, robust, and fleshy, and differ in features greatly from Europeans. Their face is somewhat of the shape of a lozenge, the forehead and chin being sharpened, but the face at the cheek-bones very broad. The eyebrows project very little, and the eyes are very narrow, and placed rather obliquely in the head, the external angles being the highest. Their nose is very small, but has not, like that of the negro, the appear-

ance of having been flattened; the hair is harsh, lank, and black. Though living in a very hot climate, they have not the deep hue of the negro or Hindu. From this description, it is evident that they belong to the same race as the Chinese.

Their language is one of those which may properly be called monosyllabic, from the mass of their radical words being monosyllables, like the spoken dialects of China. They have borrowed a considerable number of terms from the Pali, which exists among them as the language of learning and science; but in adopting these polysyllables, they suit them to their peculiar enunciation by pronouncing every syllable as a distinct word. Though monosyllabic, their language is quite distinct from that of China, but exhibits a very great affinity to that spoken by the Burmese, who consider the Rakhain, or language of Aracan, as the most antient and original dialect of the Burma language. According to Dr. Leyden, their literature is not scanty, for he enumerated twenty-nine different Rakhain compositions, of which, however, the greatest number are translations from the Sanscrit.

Though far from being civilized, according to our notions, they do not neglect education. A person rarely is met with who cannot read and write. Their records are kept on palm-leaves, beautifully lacquered in japan and red, generally on a gilt ground with dark letters. Their common accounts are written with a chalk pencil, resembling talc, on folds of paper made of the bark of a tree, and then covered with lamp-black, or on a smooth board smeared with the same substance. They have thirty-six letters in their alphabet, written from left to right, and in writing they hold the pen or pencil as we do, the lines being as fine and the characters as beautifully formed as if made with a pen and ink.

Their religion is that of Bhudda; their priests seem entirely occupied in the education of the children. In every village are two or three, and their schools are open to all. Their only remuneration seems to be a sufficient quantity of food, and the erection of a house, which answers as a residence, temple, and school-room, with generally a small pagoda annexed to it, having a number of poles and pendants hanging from it, much after the manner represented on common china-ware. Indeed all their habits, as well as their persons and dress, resemble those of the western parts of China.

The Mugs are distinguished for their simple honesty and inoffensive disposition: they are perfectly free from the servile hypocrisy of the Hindoos, and equally unlike them as to probity—their word being generally trustworthy. In dealing, they ask the price which they think the article to be worth, and no more. They are averse to lying, so that when detected after the commission of any felonious act, however serious, they almost invariably, and with the utmost frankness, confess the crime, and detail with the greatest minuteness the manner in which it was committed. Their religion enjoins them not to take away animal life; but they do not seem very bigoted to this part of their creed, as they have no objection to part with their oxen and buffaloes, and to eat every part when dead, even to the offal usually given to dogs.

The women dress much after the Chinese manner; but they are by no means secluded, having a full share in the common intercourse and transactions of life. As they are not precluded from instruction, they are often shrewd and intelligent. A peculiar usage of this nation is, that when a man wants to raise money, he pawns his wife for a certain period, or until the debt is liquidated.

The mountains which separate Aracan from the Burmese empire are inhabited by a nation called by the Burmese *Kyain*, but who term themselves *Koloon*, and whose language is peculiar, having little or no affinity to either Rakhain or Burma. They have preserved their independence, not by resisting the invasion of their more powerful neighbours, but by withdrawing themselves to other places in the interior of the range. They are a harmless and industrious race, cultivating rice in the valleys, fishing in the rivers, gathering the honey and wax of the wild bees, and fabricating a sort of cloth, called *pujung*, of the cotton of the wild cotton-tree, which abounds in the mountains. Dried fish, bees' wax, honey, and *pujung* are exchanged by them in Ava, or Aracan, for a few manufactured articles. They seem not to adhere to the doctrines either of Brahma or Bhudda.

A considerable traffic was formerly carried on between Aracan and Ava, the first exporting Hindostanee and Eu-

ropean goods, such as velvet, broad-cloth, piece-goods, muslins, betel-nut, salt, &c., and receiving in return ivory, silver, copper, sugar, tobacco, oil, and lacquered ware. It seems that this commerce has been considerably reduced since the occupation of the British, but no later statement informs us to what extent it is still carried on by the passes over the mountains. The commerce by sea is not important: a few boats coasting along the shore to Chittagong, and from thence through the Sunderbunds to Calcutta, are sufficient for all their trade to the northward. About the same number goes to Rangoon in Ava, whence they bring back silk and other articles manufactured in that country, which are much superior to those made by themselves, and more valued than any yet brought by Europeans.

This country is dependent on the presidency of Calcutta. Each of the three districts, Akyab (Aracan), Sandoway, and Ramree, is governed by a civil judge or superintendent, under the immediate inspection of a commissioner, who usually resides at Chittagong. The revenue derived from it does not exceed three lacs of rupees and a half (360,000*l.*), produced principally by the rental of the land, the Company, as sovereign, considering themselves the proprietors of the soil. This revenue barely suffices to defray the expenses, though the garrison only consists of eight companies of sepoys, two at Akyab, two at Sandoway, and four with the head-quarters of the regiment at Kyouk Phyou. (See Symes's *Embassy to the Court of Ava*; Francis Buchanan, Dr. Leyden, Paton, and Trant, in the *Asiatic Researches*; *Journal of the Lond. Geogr. Society*, vol. i.; *Asiatic Journ.*)

A'RACHIS, in Botany, the generic name of a kind of pulse, called the Earth-nut, which is much cultivated in the warmer parts of the world: it belongs to the pea tribe, to which and the bean it is botanically related. The circumstance by which the arachis hypogæa is particularly remarkable is the manner in which its fruit is produced: instead of hanging down from among the leaves in the manner of other plants, this conceals itself in the earth, in which it is deeply buried at the period when it becomes ripe, a phenomenon which happens thus:—The young fruit, instead of being placed at the bottom of the calyx, as in other kinds of pulse, is found at the bottom and in the inside of a long slender tube, which looks like a flower-stalk. When the flower has withered, and the young fruit is fertilized, nothing but the bottom of this tube with its contents remains. At this period, a small point projects from the summit of the young fruit, and gradually elongates, curving downwards towards the earth. At the same time the stalk of the fruit lengthens, until the small point strikes the earth, into which the now half-grown fruit is speedily forced, and where it finally ripens in what would seem a most unnatural position. When mature, it is a pale yellow, wrinkled, oblong pod, often contracted in the middle, and containing two or three seeds the size of a hazel nut. These are considered a valuable article of food in Africa, and the tropical parts of Asia and America. In flavour the nuts are as sweet as an almond; and they yield, when pressed, an oil in no respect inferior to that of olives.

The plant will only grow in a light sandy soil, in which its pods can readily be buried, and it requires a climate as hot at least as that of the south of France. Its stems grow from one to two feet high; its leaves are composed of four broad and blunt leaflets: and its flowers are small and of a pale yellow colour.

ARA'CHNIDA, a class of animals including spiders, mites, and scorpions, all ranked by Linnæus under Insects, but which are very properly separated from them, on account of external form, structure, and habits. The separation was first made, we believe, by Fabricius, who, looking chiefly at the structure of the mouth, characterized the greater number of the animals now ranked under arachnida, by the jaws (*maxilla*) being horny and furnished with a claw (*Unogata*). M. Lamarck afterwards made the arachnida a distinct class; but we owe to M. Latreille and Dr. Leach the establishment of characters more precise and extending to a greater number of genera. Much has been done in perfecting the knowledge of their structure, manners, and numerous species by Clerck, De Geer, Walckenaer, Treviranus, Leon Dufour, F. Sord, Straus-Dürckheim, Blackwall, and others. We shall condense into as short a compass as we can the most important points investigated by these naturalists.

The arachnida (*Acera*, Virey) differ from insects in having no antennæ; in the eyes being in most species eight,

and, even when only two in number, never being placed laterally on the head; in the legs being usually eight, though in some species six, and in others ten; and in their respiratory apparatus consisting of radiated *tracheæ*, communicating with a sort of gills inclosed in pouches in the lower part of the abdomen.

The skin or crust of arachnida is in general more leathery than horny; but whether it be soft, as in most species, or hard, as in a few, it performs a similar office to the bones of larger animals in giving support to the soft parts and attachment to muscles, the legs being jointed upon, and radiating from, a common breast-plate (*sternum*) externally; while, according to Straus-Dürckheim, there is also an internal breast-plate of a gristly texture (*un sternum cartilagineux intérieur*) in form of a horseshoe, the two ends of which are directed forwards.

The greater number of the arachnida are carnivorous, and are furnished with appropriate organs for their predatory life. Some parasitic species, such as the minute parasite mites (*Lepti*, De Geer), which we have observed infesting numerous species of insects, from the largest butterflies to the smallest gnats, are furnished with a sucker, in some respects constructed like that of the gadfly (*Tabanus*). In other species, there may be distinguished a pair of upper jaws (*mandibula*), a pair of under jaws (*maxilla*), carrying jointed feelers (*palpi*), and between them a sort of tongue formed by a projection from the breast. At the back part of the mouth is placed a piece of a horny texture, which Savigny, Latreille, and Audouin term the *pharynx*, forming the entrance into the gullet. The gullet, together with a bulging on the fore part of it, termed the stomach, as well as the intestines, run in a straight line from the pharynx to the vent. Near the upper portion of the gullet are found salivary vessels, whose exterior aperture is in the first joint of the upper jaws. The saliva secreted by these vessels appears to be poisonous. Lower down are the biliary vessels, which resemble those of insects.

In the greater number of arachnida, there is a complete and very distinct circulatory system. The heart, which differs materially from the dorsal vessel, by some termed the heart in insects, occupies the abdomen, and its pulsations may be distinguished externally. It is a thick longitudinal vessel, giving origin to a certain number of arteries, and receiving veins by which the blood returns from the respiratory organs in other parts of the body.

The respiratory organs have two striking peculiarities, upon which M. Latreille founded his two great divisions of arachnida.

The division furnished with air-pipes, similar to those of insects, comprises harvest or shepherd spiders (*Phalangia*), mites, and several other genera. 'The presence of air-pipes (*tracheæ*),' says M. Latreille, 'excludes all complete circulation, that is, the distribution of blood to different parts, and its return from the respiratory organs to the heart.'

The other division of the class comprises the numerous species of spiders, and the scorpions which M. Straus-Dürckheim and Leon Dufour place first. Their respiratory apparatus consists of small cavities formed by the union of a great number of triangular white laminae of extreme thinness. The number of these is usually two, but in some species there are four, and in others eight. The external apertures of these, termed spiracles, and, as M. Latreille well remarks, objectionably *stigmata*, are transverse chinks, corresponding in number with the pulmonary pouches.

The nervous system of the arachnida is ganglionic, consisting of nerve-knots (*ganglia*). In man and the larger animals a ganglion is composed of two substances similar to the cortical and medullary substances of the brain, and differs from nerves in being firmer in texture, and covered with a membrane of closer tissue. In the arachnida these nerve-knots are more concentrated, if the term may be used, than in insects, and they are uniform in composition, rather than a chain of ganglions equally separated. Thus in the harvest spiders (*Phalangia*) there are a pair of nerve-knots in front of the gullet, and at the back of the gullet a medullary mass, apparently consisting of three ranges of nerve-knots united.

We know nothing of the organ of hearing in arachnida, though it is certain enough that they do hear. Their eyes are all simple, not composite, like those of many insects. 'The eyes of spiders and scorpions,' says Swammerdam, 'are externally formed exactly in the same manner, and are smooth, glittering, and without divisions; and are as

much dispersed as those that are disposed at random over the body. The wolf-spider, which catches its prey by leaping on it, has its eyes placed in the same manner.' In the greater number of spiders they are eight in number, but in some six (*Dysdera* and *Segestria*), and in others two (*Phalangium*). The arrangement of the eyes, when more than two, varies considerably in the different genera, and is taken advantage of in arranging them systematically, on the principle first, we believe, pointed out by Dr. Lister, and improved upon by Latreille, Leach, and Walckenaer. Figures of various arrangements of the eyes in spiders may be seen in *Insect Miscellanies*, pp. 125, 126, after Audouin.

With regard to the sexes, male spiders are always much smaller than the females, being often not more than one fourth the size. The feelers (*palpi*), also, in the male are furnished with organs at the tip, which are of various forms, but usually bulging, whereas the feelers in the female taper gradually to a point.

Looking at the size of the female spider, and the eggs which she lays, it appears almost incomprehensible how they could be contained in so small a body. But, by observing them more closely, it may be discovered that they have not like the eggs of birds, a hard shell, but, on the contrary, are soft and compressible. Accordingly, before they are laid they lie in the egg-bag (*ovarium*) within the spider's body, squeezed together in a flat manner; and only come into a globular form after they are laid, partly in consequence of the equal pressure of the air on every side, in the same way as we see dew-drops and globules of quicksilver formed from the same cause.

The eggs of spiders, it is worthy of remark, are in most cases, though not always, placed in a roundish ball, and, as there is nothing in nature without some good reason, if we can discover it, we may infer that this form is designed to economize the materials of the silken web, which the mother spins around them by way of protection. Whether we are right or not in this conjecture, there can be no question as to the manner in which the ball is shaped, as the writer has often observed the process. The mother spider, in such cases, uses her own body as a gauge to measure her work, in the same way as a bird uses its body to gauge the size and form of its nest. The spider first spreads a thin coating of silk as a foundation, taking care to have this circular by turning round its body during the process. It then, in the same manner, spins a raised border round this till it takes the form of a cup, and at this stage of the work it begins to lay its eggs in the cup, not only filling it with these up to the brim, but piling them up above it into a rounded heap as high as the cup is deep. Here then is a cup full of eggs, the under half covered and protected by the silken sides of the cup, but the upper still bare and exposed to the air and the cold. It is now the spider's task to cover these, and the process is similar to the preceding, that is, she weaves a thick web of silk all round them, and, instead of a cup-shaped nest like some birds, the whole eggs are inclosed in a ball much larger than the body of the spider that constructed it.

There is a singular mechanism for the purpose of placing the eggs in the proper position. The eggs, different from what takes place in birds, are excluded from a cavity just behind the breast. Here there is an organ placed somewhat in form of a hook or a bent spatula, which the spider can move in such a manner as to direct every individual egg which it lays to the exact spot in the nest-cup, where it wishes it to be placed. The sense of touch in this organ must of course be very acute, as by touch it must be wholly guided, for its eyes, though eight in number, and very piercing, are situated on the upper part of the head, and cannot be brought within sight of the nest.

The hatching of the eggs of one species (*Epeira diademata*) has been traced with great minuteness, and the successive evolution of the embryo figured with great skill, by M. Herold of Marburg.

M. Latreille, whose method has been generally followed both in Britain and on the continent, arranges the arachnida into two orders:—

I. *Arachnida pulmonaria*, or *pulmonata*, distinguished by having pulmonary cavities for the purposes of respiration, and from six to eight simple eyes.

II. *Arachnida tracheana*, or *trachearia*, distinguished by having air-pipes (*tracheæ*), like insects, and more than four simple eyes.

Each of these orders comprises a number of genera which shall be noticed in their proper places.

ARACK, or **ARRAC**. This word is derived from the Arabic word *arak*, which properly signifies *perspiration*; hence *juice*, *sap*, and thus, lastly, *ardent spirit*. Under various modes of spelling it is employed as a general name for distilled spirits along the northern coast of Africa, including Egypt, over all Asia, and even in the north and eastern parts of Europe. This spirit is prepared from different substances, more especially from sweet juice (toddy) extracted from the unexpanded flowers of different species of the palm tribe. In Ceylon, where a large quantity of arack is manufactured, it is entirely distilled from coco-nut tree toddy. [See *COCO-NUT TREE*.] Some authors assert that toddy is extracted from the branches of palm-trees, and even from incisions made in the stem, but erroneously. The 'toddy topes,' or coco-nut tree orchards, are very extensive in Ceylon, and their produce is collected for the distillation of arack, and the manufacture of sugar and oil.

In Ceylon, when it is intended to draw toddy from a tope, the toddy-drawer selects a tree of easy ascent near to the centre of the tope, the stem of which he surrounds with a number of bands made of creepers, about a foot distant from one another. Upon these bands he ascends the tree, and by means of the stems of creeping plants or coir ropes, he connects the heads of a number of trees, so as to enable him to pass from tree to tree in the subsequent operation of collecting the produce.

The ordinary implements of a toddy-drawer are a large broad knife, which he carries in a coffer or basket suspended by a cord tied round his body; a mallet, consisting of a piece of hard wood about a foot in length; and the shell of a large gourd, which is suspended round his waist. When a tree is in a state fit for yielding sweet juice, the toddy-drawer ties the flowering spath in different places, by means of the white leaves of young branches. This process has the effect of preventing a bud from blowing. The spath is then bruised along its whole length by means of slight blows with the mallet or bat of hard wood. This operation occupies a few minutes, and requires to be regularly repeated every morning and evening for six or seven days. In a few days after the spath has been tied, a few inches of it is cut off by means of the broad knife. Two or three days after it is thus truncated, sweet juice exudes from the cut surface, which is received in an earthenware vessel attached to the spath. The liquor issues, drop by drop, and a good healthy blossom will yield from two to four English pints in twenty-four hours, and continue to afford that quantity for a period extending from three to five weeks. As the coco-nut tree blossoms every four or five weeks, two spaths on one tree sometimes yield sweet juice at the same time. The toddy-drawer generally ascends the trees, for the purpose of collecting the sweet juice that has exuded into the toddy pots, both morning and evening, and to cut off a fresh portion of the flowering spath. The toddy is poured from the earthen vessels into the gourd, which is conveyed to the ground by means of a line. The gourd is emptied into a large vessel by a person at the foot of the tree, and drawn up by the toddy-drawer for the purpose of being refilled.

Arack may be distilled from toddy the same day it is drawn from the tree, but sometimes this operation is delayed until it becomes sour. The process of distillation is carried on in the maritime provinces in copper stills, but in the interior of the island earthen vessels are chiefly employed. Toddy yields by distillation about one-eighth part of proof-spirit.

On the peninsula of India, arack is distilled from the flowers of the *Bassia longifolia*, Tell mee (*Cingalese*), the *Mahwah*-tree, and the *Bassia latifolia*. Mahwah-arack may be procured at the rate of an English pint for less than one penny.

Arack is prepared in the island of Java, where it is known by the name of *kneip*, from a mixture of molasses, palm-wine, and rice, in the following proportions.

Molasses	62 parts
Palm-wine (toddy)	3 ditto
Rice	35 ditto

100 parts of these materials yield 23½ of proof spirit.

The rice is first boiled, and after being cooled, a quantity of yeast is added to it and pressed into baskets. Each basket is placed over a tub for about eight days, during which time a quantity of fluid passes through the basket into the tub; this fluid is added to the molasses and toddy in large fermenting vats, where the mixture is allowed to remain until it is fit for distillation.

In most parts of Turkey, arack (*raki*) is made from the skins of grapes. It is flavoured with aniseed, and sometimes contains a solution of gum-mastic. The mountain Tartars distil it from sloes, elder berries, wild grapes, plums, &c., and the Calmuck Tartars distil it from milk.

Ceylon exports annually, and for the most part to the presidencies of Bengal, Madras, and Bombay, from 5000 to 6000 leaguers of arack, each containing 150 gallons. The custom duty on the exportation of arack amounts to 20 per cent. *ad valorem*, and in 1813, the Madras government imposed an excise duty of 440 per cent. upon Ceylon manufactured spirits. The prime cost of arack at Colombo varies from 8d. to 10d. per gallon. Ceylon arack is superior to Batavian arack, and it commonly brings a higher price of from 10 to 15 per cent. on the peninsula of India, than Javanese manufactured spirits. The quantity and estimated value of arack exported from Ceylon in 1825 amounted to 611,218 gallons, value 21,500*l.*, which is at the rate of nearly 8½d. per gallon. The following is a schedule of duties levied on the coco-nut plantations in Ceylon, average of three years, 1827-8-9, which will show the importance of the manufacture of arack in political and commercial points of view.

Distilling of arack	£ 3,644
Retail of ditto	24,975
Export of ditto	3,136
Export of coir	153
Export of jaggery	162
Export of coppers	1,539
Export of coco-nuts	1,551
Export of coco-nut oil	413
	<hr/>
	£ 35,573

The tariff duty levied upon arack imported into the United Kingdom is 15*s.* 6*d.* per gallon. (See *Marshall's Contribution to a Natural and Economical History of the Coco-nut Tree*; and *Bartolacci on the Revenue and Commerce of Ceylon*.)

ARAD ISLAND. [See *BAHREIN*.]

ARÆOMETER. [See *HYDROMETER*.]

ARÆOSTYLE. This is a term composed of two Greek words, *ἀραιός*, signifying *rare* or *few*, *thin*, *weak*, and *στυλος*, a *column*. It is used by writers on architecture, who follow the absurd system of Vitruvius, as a name for one of what he terms 'the five species of temples.' As the term itself imports, it refers rather to the arrangement of columns than to the composition or structure of a temple. The kind of temple called aræostyle is, according to Vitruvius himself, that in which 'the columns are placed more distant from each other than in fact they ought to be.' This, the commentators upon that writer say, is when the space between columns, or the intercolumniation, is from four to five diameters. The aræostyle intercolumniation is generally assigned by the same authorities to what in the Vitruvian system is called the Tuscan order; for as the remains of the more classical architectural works of the Greeks and Romans, on which the system *professes* to be based, exhibit no examples of either the aræostyle intercolumniation, or of the Tuscan order of columns, each could with safety be assigned to the other. The east or market front of St. Paul's church, Covent Garden, in London, exhibits an example of what the followers of Vitruvius would term a Tuscan portico *in antis*, though the columns are hardly set widely enough to come up to the character which they have assigned to the aræostyle intercolumniation. [See also *EUSTYLE*.]

ARÆOSYSTYLE. This term is compounded of *aræo* and *systyle*, and was formed to designate an arrangement of columns not mentioned by Vitruvius. The French architect, Perrault, is understood to have introduced the term aræosystyle to designate an alternately very wide and very narrow intercolumniation, or, what is familiarly called coupled columns. This arrangement is alternately *aræostyle*—columns too far apart; and *systyle*—columns too close together.

Perrault's front of the palace of the Louvre in Paris, the western portico of St. Paul's cathedral, the porticoes, pavilions, and colonnades of the Pimlico palace, and numberless other edifices in London, exemplify the peculiarly inelegant mode of arranging columns which the term aræosystyle designates.

ARAFAT is the name of a hill near Mecca, where, as

cording to the belief of the Mohammedans, Adam, conducted by the angel Gabriel, met Eve, after they had been separated for two hundred years, in consequence of their disobedience, and banishment from Paradise. The Mussulman pilgrims, after having visited the town of Mecca, perform their devotions on Mount Arafat on a fixed day, the ninth of Dsu'l-hijjah, the last month of the Mohammedan year. Burckhardt, who, in 1814, visited those territories which the Mohammedans regard as sacred, in the disguise of a *haji* or pilgrim, describes Mount Arafat as a granite hill, rising on the north-east side of a plain, closely encompassed by mountains, but separated from them by a rocky valley. The hill is, according to him, about a mile or a mile and a half in circuit; its sides are sloping, and its summit is nearly two hundred feet above the level of the plain. 'On the eastern side,' says he, 'broad stone steps lead up to the top, and a broad unpaved path on the western, over rude masses of granite, with which its declivity is covered. After mounting about forty steps, we find a spot a little on the left, called Modaa Seydna Adam, where, according to Mohammedan tradition, the angel Gabriel first instructed Adam how to adore his Creator. On the summit of the hill the place is shown where Mohammed used to take his station during the pilgrimage; a small chapel formerly stood over it, but this was destroyed by the Wahhabites. The steps and the summit are covered with handkerchiefs to receive the pious gifts of the pilgrims. The top of the hill commands an extensive prospect. Several large reservoirs lined with stone are dispersed over the plain; they are filled from a fine aqueduct which supplies Mecca with fresh water from the eastern mountains.' From the summit of Arafat, Burckhardt counted about three thousand tents scattered over the plain; but the greater number of the pilgrims were without tents. The number of persons assembled here from all the Mohammedan countries he estimated at about seventy thousand, and that of the camels at from twenty to twenty-five thousand. 'There is, perhaps,' says he, 'no spot on earth where, in so small a place, such a diversity of languages are heard; I reckoned about forty, and have no doubt that there were many more.' The essential part of the ceremony at Mount Arafat consists in a procession of all the pilgrims towards the hill, the sides of which they cover from top to bottom; and in hearing a sermon, which is usually delivered by the kadhî of Mecca, and which lasts from about three o'clock in the afternoon till sunset. No pilgrim, although he may have visited all the holy places of Mecca, is entitled to the name of *haji* unless he has been present on this occasion. (See Burckhardt's *Travels in Arabia*, London, 1829, 8vo. vol. ii. p. 40, &c.)

ARAGON, or ARRAGON, kingdom of, one of the provinces of Spain, situated between 40° and 42° 55' N. lat., 35' E. and 1° 55' W. long., is bounded on the east by Catalonia and part of Valencia; by Navarra and Old Castile on the west; on the south by Valencia; and on the north by the Pyrenees. It extends, in its greatest length, about a hundred and thirty miles from east to west, and two hundred from north to south. Aragon may be compared to a large basin surrounded on all sides by mountains. The Pyrenean chain and its ramifications separate it from France, the Sierras of Molina and Cuenca from Castile, and those of Morella from Valencia. The principal of these mountains is the great Pyrenean chain. The offsets of this range, which penetrate into Aragon, form a number of lateral valleys with a rapid slope to the south. Taking Monte Perdido or Mont Perdu, elevated 11,168 feet above the sea, as a central point, the range descends westward in eight successive steps to the ocean. On the east, the same gradual descent is observed as far as the frontier of Catalonia, where it rises again in the Peña Maladeta to 11,424 feet; it again descends as far as the valley of Andorra, where it rises in the Moncal to 10,663 feet; from which point it makes another inclination, and rises again in the Canigú to 9141, and then makes a rapid descent to the Mediterranean. This circumstance at first led to the erroneous idea that the Canigú was the highest point of the range, for a spectator on its summit might observe the chain appear to descend in all directions, while the distance diminished the apparent height of the other summits; but by exact measurements this error has been rectified.

The first valley of Aragon which we find in the Pyrenean chain, as we advance from the east, is that of Benasque, the capital of which is the town of the same name, with a fortress

and a custom-house. Proceeding westwards, we find the valleys of Bió, Brotó, Tena, the capital of which last is Sallen, in the centre of the range: about two miles from Sallen is the source of the river Gallego (an affluent of the Ebro), and not far from it are the mineral waters of Panticosa; then follows the valley of Canfranc (the Puerto, or opening which bears that name, is 6713 feet high); those of Aragón, Hecho; and the last, Ansó, on the frontier of Navarra. Every valley is separated from the adjoining by the gigantic offsets of the Pyrenees, which, running in an irregular southern direction from the main mass, form these lateral valleys. All the summits of the Pyrenees in this part are covered with snow nine months in the year, and even in June it is found five or six feet deep. The secondary chain of this province is that called by some geographers the Iberian, which runs in a direction from N.W. to S.E., under the names of Montes de Oca, 5436; Sierra de Moncayo (the Mons Caunus of the antients), elevated 4921 feet; Sierra de Molina, 4488; Sierra of Teruel, 4331, at the city of that name; and then enters Valencia, and terminates on the shore of the Mediterranean near the *desierto of las Palmas*.

Almost all the rivers of Aragon have their source in these two chains of mountains, and run in different directions to their common receptacle, the Ebro. This river crosses the province from N.W. to S.E. and divides it into two parts almost equal. Its affluents on the right bank within Aragon are, the Huecha, Jalon, Huerva, Aguas, Martin, Guadaloque and Matarranya, which latter serves as the line of boundary between Aragon and Cataluña; and on the left, the Arvo, Aragon, Gallego, and Segre. (See ENROL)

Several roads cross the province, passing through all the principal towns. The Canal Imperial de Aragon was commenced in 1529, by order of Charles V. The water was taken from the Ebro at Fontellas; a basin and a house were constructed three miles below Tudela in Navarra, and the canal was continued parallel to the river. This work was abandoned, and remained unfinished for nearly two hundred years. Under Charles III., in 1772, the conduct of the undertaking was entrusted to Don Ramon Pignatelli, a man of great activity and skill, under whose direction it was continued and carried six miles below Zaragoza. This canal crosses the Huecha, Jalon, and Guerva. If we consider it with respect to its width, we may assuredly say that it is one of the finest in Europe, but the benefits derived at present from it are very inconsiderable. There is sufficient water for vessels of from sixty to eighty tons, but in consequence of the canal not reaching the sea the trade is very limited: if ever the original project is completed, and the navigation continued to Tortosa, the advantages which Aragon, Navarra, and Catalonia will derive from it are incalculable. In 1819, the produce of this canal amounted to about 13,352*l*. The object of this canal is double, being designed both for irrigation and navigation.

The climate of Aragon varies according to the elevation and particular situation of the different districts, but in general, except on the mountainous parts, it is adapted to most of the productions of temperate climates. The winds that chiefly prevail are the Cierzo, or N.W., and the Bochea, or S.E. These two continue during nine months in the year. The period that the S. or S.W. blows is very short. The W., which the Aragonese call *faguero*, and the Castilians *favonio*, is always welcomed by the husbandman, as it never fails to bring along with it abundant showers, which are favourable to vegetation.

The productions of the soil are, wheat, barley, rye, oats, Indian corn, leguminous vegetables, esparto, or Spanish broom, flax, hemp, sumach, barilla, madder, saffron, liquorice, fruits, oil, wine, and timber. The productions of the mineral kingdom are gold, silver, copper, iron, lead, quicksilver, cobalt, alum, jet, coals (near the source of the Martin, a tributary of the Ebro), and copperas: few of these mines are now worked. The chief mine is one of rock-salt at the village of Remolinos, near Alcañiz, which supplies Aragon and Catalonia with this article. Peat earth, which has been compared with that of Holland, is found in the district of Teruel, and used for fuel. The mountains abound in game; wolves and bears are likewise found, and numerous herds of cattle feed in the valleys. Before the Peninsular war, the number of sheep was 2,050,000 heads. The rivers produce exquisite fish, particularly trouts and eels; of the latter, the most celebrated are those of a lake, or rather pond, near Alcañiz. The produce of grain and wine is more than sufficient for the con-

sumption; but there is a deficiency of horned-cattle and mules, which are supplied from France. The industry of Aragon is very limited, and consists principally in manufactures of common cloth, hemp sandals, sacks, and cordage, hats, leather, paper, earthenware, and some iron-foundries.

Aragon is, in a considerable degree, impregnated with salt; the water of many of its rivers is as saline as that of the sea, particularly the spring near Bujaraloz. At the bottom of the lake Gallocanta, between Bello and Tornos, fuci and other sea plants are found. Thermal springs are abundant both in the Pyrenees and the Iberian chain.

The province is divided into thirteen districts, or corregimientos, viz., Albarracin, Alcañiz, Barbastro, Benavarre, Borja, Calatayud, Cinco-villas, Daroca, Huesca, Jaca, Tarazona, Teruel, and Zaragoza; the capitals of these districts are the towns of the same name, which are likewise the principal towns in the province.

The population of Aragon, according to the census of 1803, amounted to 657,376 upon a surface of 1232½ square leagues; the number of souls for a square league being 533, a proportion by no means great, even if we consider that mountains occupy a great part of the surface. (Antillon.) Asso states the area at 2000 square leagues, of 25 to a degree, which is equal to about 15,346 English square miles.

Aragon contains 1 archbishopric, 6 bishoprics, 8 collegiate churches, 1396 parishes, 228 convents of both sexes, 29 military commanderies, 23 hospitals, 2 universities, 12 cities, 239 villages, 688 hamlets. Like the rest of the peninsula, Aragon was successively under the dominion of the Carthaginians, Romans, and Goths. When the Arabs invaded Spain, those Aragonese who escaped the sword of the invaders sought a refuge in the fastnesses of the Pyrenees, where they assembled together in the valley of Sobrarbe in Navarra, and chose for their leader Garcia Iñiguez, called also Iñigo Arista, on account of his nimbleness, about A.D. 819. They stipulated with him that since by common consent they had elected him their chief, and put him in possession of the territory which they had wrested from the Moors, he was bound to swear to them, first, to maintain their fueros, or privileges, and to improve them; secondly, to divide with them the territory he should conquer from the enemy; not to enact laws without the advice and consent of his subjects; not to declare war, or make either peace or truce with any sovereign, without the assent of twelve of the most noble and twelve of the oldest and wisest men of the country. The chief agreed to these conditions, and declared that if he ever violated the compact established between them, they were free from their engagement, and might elect another chief, either Christian or Pagan (Zurita, book i. ch. v. p. 9). The Aragonese, not content with setting these boundaries to the royal authority, created a magistrate or officer peculiar to them, whom they denominated the *Justicia*. This officer was the guardian of the laws and the mediator between the king and the people. He was at first appointed by the king and the Cortes together, and his office was for life. His person and property were sacred; he was the supreme interpreter of the law: to him both king and subjects applied for redress against wrong: his decisions were without appeal, and he was only answerable to the nation duly assembled in Cortes. Once elected, he could neither be arbitrarily removed by any power, nor renounce the office. He had two substitutes, or lieutenants, to act for him, when he was unable to perform his duties. These officers were at first appointed by him, and enjoyed the same privileges as he did. Both the *justicia* and his substitutes were chosen from the order of caballeros, or middle class between the nobles and the commons. In 1461, a law was enacted by which the kings were empowered to nominate the deputies of the *justicia*. The Cortes deposited in a box the names of eight individuals as candidates for that office, out of which the king chose two by lot, when it was necessary to fill up the vacancies of those whose term had expired, or who had died. Their office lasted only three years, and none could be re-elected before the same number of years had elapsed. It is impossible to say when the office of the *justicia* began; Zurita and all the other historians of Aragon make its creation contemporary with that of the fuero of Sobrarbe, but no mention is made of the *justicia* before the conquest of Zaragoza.

The Cortes were composed of four *brazos*, or orders,—the ecclesiastics, the nobility, the caballeros, and the people.

The ecclesiastics were not admitted into the Cortes until 1301. (Blanca's *Modo de Proceder en Cortes*, ch. vi. p. 14.) The first Cortes, where the *brazo* of the *universidades* or commons is distinctly mentioned, are those of Monzon, in 1131. These orders formed one house. Every *brazo* gave its vote separately, and the majority in each *brazo* decided the vote of that *brazo*, but the unanimous consent of the four *brazos* was requisite to the enactment of any law. Any individual might stop the proceedings of the Cortes by giving his veto in writing. The number of the nobles that generally sat in the Cortes were eight; the ecclesiastic *brazo* consisted of twenty-three, and the cities and boroughs that returned members were thirty-one. The number of the members for the cities and boroughs was not fixed. In the Cortes of Zaragoza, A.D. 1163, fifteen deputies from that city, besides many from Huesca, Jaca, Calatayud, Daroca, and Tarazona were present; and those of Lerida, in 1214, were attended by ten deputies from every principal city and borough in the realm. Thus Aragon had a popular representation nearly a century before any other nation in Europe.

The Cortes were summoned by the king, and were also dissolved by him. After the convocation, they adjourned from day to day, for an indefinite period of time. The adjournment was made by the *justicia*: if before the opening of the sessions, in virtue of his authority, as *juez* of the Cortes; and if after, by the order of the king and at the will of the Cortes themselves. When the king absented himself from the place where the Cortes were assembled, they were dissolved. The king presided in the Cortes in person, and when he was unable to do so, that body empowered the crown prince, or some other individual of the royal family, to supply his place.

On the opening of the assembly, a discourse was pronounced by the king, called the *proposicion*. In former times every *brazo* answered separately to the speech from the crown, but subsequently the archbishop of Zaragoza addressed the king in the name of the four *brazos*. On the first sitting every *brazo* appointed a certain number of individuals of their respective order to prepare and put in a proper shape the matters which were to be laid before the general assembly. These were called *promovedores*, or promoters, and *tratadores*, or discussers. Of the *promovedores*, two were so by virtue of their office, viz., the archbishop of Zaragoza for the ecclesiastic, and the *jurado* of the same city for the commons: the rest were elected by their respective *brazos*. The *promovedores* proposed the subjects and petitions which were to be subjected to discussion, and the *tratadores* examined and arranged them in proper order.

From the first opening of the Cortes, the *justicia* was obliged to sit in a place below the throne to hear the *greuges*, or grievances, which any Aragonese had to make against any individual, high or low, for infractions of the *fueros*, and 'this,' says Martel, 'was not done by way of supplication, but as a matter of right.' Certain officers called *recojedores* and *examinadores de greuges*, or collectors and examiners of grievances, were appointed, to decide whether the complaint presented was a constitutional greuge or not. When the king or any of his ministers were affected by the greuge, he was excluded at the time of giving the sentence, which was pronounced by the *justicia* and the Cortes. Both the positive infraction of the law, and the nonfulfilment of it, were a subject of greuge. As these complaints were more frequently made by persons of rank, some have erroneously supposed that this was a privilege of the nobility: but Blancas says, that if any officer of the crown had put to the torture (a thing contrary to the *fueros*) the most miserable farmer of the meanest village in the kingdom, the latter had a right to complain to the Cortes, and he should not only be attended to, but even be furnished by the nation with the necessary means for the prosecution of his cause.

The *servicio* or supplies were granted by the Cortes, but not until the several petitions of the deputies had been first granted. In former times, it was not called *servicio*, but *profierta* or *socorro*, offer or succour, and was made not in money, but in men. The first time that the kings of Aragon asked for the *servicio* in money was at the Cortes of Monzon, 1376, when Pedro IV. demanded a certain sum to pay one thousand lancers to continue his war with France. 'The deputies,' says Blancas, 'were amazed at this novelty never before heard of in the kingdom, and answered his highness, "that the Aragonese were not accustomed to

serve their kings except with their persons; that it was the Jews and Moors that served theirs with money." The following still more striking fact is recorded by the same historian:—In the Cortes of Teruel, 20th of March, 1428, Miser Juan de Marguillen, treasurer to the queen, presented to the tratadores of the Cortes and the king an humble petition from *la Señora Reina*, requesting some pecuniary assistance for her support; to which they answered that such a thing had never before been done, and it was their opinion that it could not be done without great detriment to their liberties; a thing which *la Señora Reina* neither could nor ought to wish, and therefore they begged *Su Mercé* to bear patiently their refusal. On the treasurer's requesting them to consider again, both the petition and the answer they had given, their reply was, that they stood firm to what they had said, and they neither could nor would alter it in the least. In 1383, Pedro IV. obtained of the Cortes a loan of 60,000 florins, about 9000*l.*, a *buen tornar*, to be duly returned. In 1412, another sum was lent to Fernando I. upon the same condition. In course of time these debts were remitted to the kings, and by little and little, the custom was introduced of granting supplies of money, the first of which was the one made to Fernando el Católico, for the conquest of Tunis and Bugia. The ordinary expenses of the state were defrayed by means of certain taxes imposed by the Cortes, which were granted generally for six years. These taxes were either direct, as the *bovage*, or a certain sum paid for every couple of oxen, the *monetage* or property tax, and the *focage* or house tax; or indirect, as the *sisas*, or a tax upon the articles of food. After the period for which these contributions had been granted, nobody could exact them, under the penalty of excommunication.

The last sitting of the Cortes was that called the *solio*, in which all the laws that had been enacted were solemnly proclaimed and sworn to, first by the king and the justicia, and then by two individuals for each brazo, and by all the public functionaries. The sanction of the king was absolutely requisite for the validity of any law; if he refused to give it, the deputies might insist, with all due respect, until the king signified that it was not his pleasure that it should be insisted upon any further. Though the king was present during the discussion, he was obliged to leave the Cortes when the vote was given.

By the Cortes and the justicia two deputies were appointed for each brazo to sit permanently until the next general assembly. The *diputacion*, in union with the justicia, watched over the observance of the law, and examined the accounts, and every thing in the financial department.

Among the many privileges of the Aragonese, the most notable were, the *privilegio de la manifestacion*, and those of the *union*. By the privilege of the manifestacion, when any Aragonese was injured by any tribunal of the king contrary to the fueros, he appeared before the justicia, and being asked by him whether he desired to be *manifestado*, if he answered in the affirmative, he was placed in the prison of the justicia, called the prison of the *manifestacion*, and his cause was taken from the judges of the crown, and examined by the court of the justicia. The privileges of the union were granted by, or rather wrested from, Alonso III. This prince having assumed and exercised the royal dignity without having first taken the necessary oath of allegiance to the constitution, his subjects formed a union, and with the Cortes at their head, threatened to withdraw their allegiance, unless he consented—not to prosecute capitally any member of the union, not to cause him any injury, or even to imprison him without previous sentence of the justicia to that effect, and with the approbation of the majority of the Cortes; secondly, that the king should be obliged thenceforward to assemble the Cortes every year at Zaragoza in the month of September, and to give the deputies the power to appoint his ministers, councillors, and other officers of the crown, and even the officers of his household, with the condition that the persons appointed should first swear to advise him well and loyally; and that in case he or any of his successors infringed any of these privileges, the members of the *union* would not acknowledge him as their king, and, without any charge of treason, might choose another. As a security for these privileges, seventeen castles in Valencia and Aragon were placed in the hands of the representatives of the *union*. This extraordinary transaction took place on the 29th of December, 1288. Pedro IV. abolished these privi-

leges in the Cortes of Zaragoza, 1348; still the justicia of Aragon, in union with the diputacion of the Cortes, preserved the constitutional right of calling the nation to arms against the king, when he invaded the fueros of the kingdom.

The Aragonese devised an oath calculated to remind their monarchs of this privilege. 'The king,' says Antonio Perez, 'upon his accession to the throne, kneeling before the justicia, the latter being seated and with his head covered, swears solemnly to observe the fueros of the nation; then the justicia, in the name of the Cortes, says, *Nos, que valemos tanto como vos, os hacemos Rey y Señor, con tal que nos guardéis nuestros fueros y libertades, y sino, no*; that is, We, who are worth as much as you, make you our king and lord, provided you keep our laws and liberties, otherwise not' (*Relacion de Antonio Perez*, p. 132.)

Under the monarchs of the Austrian dynasty, these institutions, which had lasted nearly eight centuries, began first to be undermined. The justicia Juan de Lanuza IV., having in virtue of his authority rescued Antonio Perez from the grasp of the king and the inquisition, seeing that the Castilian army was in march to invade the kingdom, called the Aragonese to arms, and the priests, both in the pulpit and in the confessional, exhorted the people to come forward in defence of their liberty; but the unfortunate Lanuza was shamefully deserted by the nobility, imprisoned while in the performance of his duties, and without any trial publicly beheaded. The king, Philip II., in a letter written with his own hand, without any signature of either secretary or minister, after the fashion of an Asiatic tyrant, said to his general, 'As soon as you receive this letter, you are to proceed to the imprisonment and execution of the justicia Don Juan de Lanuza, and let me hear of his execution as soon as of his imprisonment.' This order was strictly obeyed, and between the arrest and execution of Lanuza there was only the lapse of twenty hours. His charge, says Perez, was his arrest, and his defence his martyrdom. From that time the constitution of Aragon became an empty sound; but it was not actually abolished until the eighteenth century, when Philip V., the first of the Bourbon dynasty in Spain, abolished it, not only in virtue of the sovereign authority resting in him, but by the right of conquest, as the decree states. In civil concerns, however, the Aragonese are still governed by their own laws, and only apply to those of Castile in cases where their fueros are deficient.

The crown in Aragon, as well as in all the rest of Spain from the time of the Goths, was elective: and although the king was generally chosen out of the family of the deceased monarch, following the order of primogeniture, until the fifteenth century, yet instances may be adduced both in Aragon and in Castile, of the nation having departed from this custom, and appointed as successor another in opposition to the one who might be called the rightful heir. We are not aware that there existed any positive law on this subject, previous to the constitution of 1812.

In accordance with its political constitution, all the other codes of Aragon were dictated by a more liberal and humane spirit than those of the neighbouring states: thus while, in the surrounding nations, a criminal, or perhaps an innocent person, was inhumanly tortured, the Cortes of Zaragoza, in 1325, declared it unlawful to put any Aragonese, of whatever rank or condition, to the torture, or to confiscate his property; neither could foreigners be subjected to it, except for forgery.

Aragon was formerly the most powerful nation in the Peninsula: it embraced the provinces of Navarra, Catalonia, and Valencia; abroad, it possessed the Balearic islands and Sardinia. Ferdinand, the catholic, king of Aragon, was also king of the two Sicilies, and by his marriage with Isabella of Castile, the two kingdoms of Aragon and Castile were united under one sceptre.

The Aragonese are sullen and stern, scrupulously honest in keeping their word; brave, firm, and tenaciously opposed to all foreign dominion: the firmness of their character is proverbial, and often carried to excess.

A Chronological Table of the Kings of Aragon, from the separation of that kingdom from Navarra to its union with Castile, showing the years of accession —

A. D.

1035. Ramiro, son of Sancho el Mayor

1063. Sancho, son of Ramiro.

1094. Pedro, son of Sancho.

1104. Alonso, brother of Pedro.
 1134. Ramiro II., brother of Alonso.
 1137. Petronila, daughter of Ramiro II. Aragon and Catalonia were united by the marriage of this queen to Raimundo III., count of Barcelona.
 1162. Alonso II., son of Petronila.
 1196. Pedro II., son of Alonso II.
 1213. Jaime, son of Pedro II.
 1276. Pedro III., son of Jaime.
 1285. Alonso III., son of Pedro III.
 1291. Jaime II., brother of Alonso III.
 1327. Alonso IV., son of Jaime II.
 1336. Pedro IV., son of Alonso IV.
 1387. Juan, son of Pedro IV.
 1395. Martin, brother of Juan.
 1412. Fernando, brother of Enrique III., king of Castile, and nephew to Martin.
 1416. Alonso V., son of Fernando.
 1458. Juan II., brother of Alonso V.
 1479. Fernando II., son of Juan II., married Isabel of Castile, and thus Aragon and Castile were united under one sceptre in 1516.

See Zurita, *Anales de Aragon*; Blancas, *Rerum Aragonensium Commentarii*, *Modo de proceder en Cortes*; Martel, *Modo de celebrar Cortes, Fueros y Observancias del Reino de Aragon*; Miñano, *Geografía de España*; Antonio Perez, *Relacion*; Coxe's *Memoirs of the House of Bourbon*. There is a work entitled *Historia de la Economía Política de Aragon*, por D. J. de Asso, Zaragoza, 1798, small 4to. Antillon, in the preface to his *Geography*, gives it a qualified character.

ARAL, SEA OF, a great inland lake of Asia, situated east of the Caspian Sea, between the forty-third and forty-seventh degrees of north latitude, and the fifty-eighth and sixty-second degrees of east longitude. The only exact astronomical observation which has been made with the view of determining the position of the Aral Lake is that of M. Lemm, who found the longitude of the western shore, in latitude $45^{\circ} 38' 30''$, to be $56^{\circ} 8' 59''$ east of the meridian of Paris, or $58^{\circ} 29' 14''$ east of that of Greenwich. Its greatest length is about 290 miles from N. to S.; its breadth from E. to W. is irregular, but it is no where less than 130 miles, and in some places 250. In superficial extent it far exceeds any lake in the eastern hemisphere, except the Caspian. Its depth is not great, and it abounds so much in sand-banks near its shores, that the Kirghiz fishermen, its only navigators, are obliged to use flat-bottomed boats. The southern extremity is studded with innumerable small islands at the mouth of the river Amoo, and from this circumstance it has received its name, Aral, which in the Tartar language signifies *island*.

The water is salt, but no experiments appear as yet to have been made to ascertain its specific gravity, and the nature of its saline contents—how far these are similar to the salts contained in sea-water: the probability is, that they are very different in quantities, and, in some respects, in their nature. It would be important to determine this with accuracy, in order to compare the results with those of similar experiments in future years; a great diminution of its superficial extent has taken place within a very recent period, and seems to be in progress, and it would be interesting to know whether any corresponding increase takes place in the saltiness of its waters. Two rivers of considerable magnitude discharge their waters into this lake; the Syr-daria or Sihoun, the ancient Iaxartes, flows into it from the east; the Amou or Oxus, the Oxus of the antients, enters it from the south. The lake, like the Caspian, has no outlet; and the whole of the water supplied by these rivers, as well as that of some minor streams, must be carried off by evaporation. The evident proofs of a gradual lowering of the level of the lake, which we shall afterwards mention, show that the supply of water is not equal to the waste; in the heat of summer, the evaporation from so vast an expanse must be enormous, and the quantity poured in during this period must be greatly diminished, for the two great rivers become fordable in places where, in the spring, they are navigable, and the channels of the streams which flow from the steppes on the north become quite dry.

It has been ascertained, that in this part of Asia the continent, over an extent of more than 18,000 square leagues, depressed below the level of the ocean; the Caspian Sea occupies the lowest parts of this depression. It was long

suspected that the Caspian was lower than the Black Sea, and the fact was ascertained with great accuracy, in the year 1811, by the Russian travellers, Engelhardt and Parrot, who were sent by the Academy of Sciences at St. Petersburg to examine the mountainous region of the Caucasus. By a series of levellings at fifty-one different stations across the mountains, and by means of barometrical observations, they found the surface of the Caspian to be 544 toises or 348.39 English feet lower than that of the Black Sea. This depression extends to a great distance on the north, for by the barometrical measurements of Helmersen and Hofmann in the years 1828 and 1829, the town of Orenbourg, on the Ural or Iaik river, is only fifty-two toises or 332.41 English feet above the Caspian, consequently very nearly sixteen feet lower than the level of the Black Sea. Now Orenbourg is 500 versts, or about 335 miles, in a direct line from the shores of the Caspian; and Humboldt is of opinion that the northern boundary of the depression runs between the neighbourhood of the towns of Orenbourg and Saratov, and consequently includes all the country lying between the Volga and the Ural south of that line, these rivers being in some places more than 300 miles distant from each other. Humboldt further states, that the great chain of the Himalaya extends westward, until, passing to the south of the Caspian, it joins the tableland of Azerbajan, south-east of the Caucasus, and forms the southern boundary of the great depression.

On the north of the Aral Lake is a wild hilly region, thinly inhabited by half-civilized nomadic tribes, who are to be found all round the lake, wherever an *oasis* in the desert enables man to subsist. The Monghodjar mountains, which occupy the highest part of these steppes, are a continuation of one of the groups into which the great Ural chain divides itself towards its southern termination: the insulated cone, called Airouk, the highest point, is only 960 feet above its base. The Urals in the neighbourhood of Orenbourg are composed of a red sandstone, and the same rock extends into these steppes of the Kirghiz. Dr. Pander, the naturalist, attached to the Russian embassy to the Khan of Bokhara, found between Orenbourg and the Monghodjar mountains the red sandstone replaced by a pudding-stone composed of quartz pebbles united by a quartzose cement, and then passing into a white sandstone; he observed a stratum of coal in the bed of a brook in this sandstone; he found the pudding-stone covered by a limestone full of shells, with sharks' teeth, many belemnites and ammonites, some of the latter two feet in diameter; and he discovered beds of gypsum associated with the limestone: the Monghodjar mountains are composed of the sandstone associated with porphyry and greenstone. The hilly region gradually sinks to sandy plains towards the south and east, no branch of the Urals being prolonged so as to reach any part of the Altai chain. These plains are composed of clay, marl, and calcareous tufa, covered by loose sand, which is blown up into hillocks from thirty to forty feet high, and the aspect of the country is thus changed after every storm of wind. In these desert plains between the base of the hilly region and the shores of the Aral Lake are two ranges of low hills called the Great and Little Bourzouk; the latter terminates in a promontory, at the north-east angle of the lake, but the Great Bourzouk extends considerably westward. North-east of the Little Bourzouk are some hills composed of indurated marl full of marine shells, and the formation extends to the shores of the lake. The hills of Aigour and Sari-boulak, forty miles inland, are composed of it, and they seem to have been the antient shores of the lake. The northern sides of the hills, or those sloping from the lake, are gradual and covered with shrubs; but the side of Sari-boulak next to the lake presents a face of naked marl, furrowed by torrents, with conical masses cut by precipitous sides from 120 to 180 feet high, and the marl contains beds of shells and fishes' bones, from three to four feet thick. 'I mentioned to our Kirghisians,' says Baron Meyendorff, 'the traces of water on Sari-boulak, and they assured me that their fathers had seen the waters of the Aral Lake extend to the foot of this hill, although it is at present sixty versts distant from it. So great a number of the Kirghisians have told me the same thing, that I consider it as an undoubted fact, and it proves how very considerable, and at the same time how rapid, the diminution of the waters of the Aral Lake has been. It continues to diminish, and one of our guides pointed out a place in our route, far inland, which he himself remembered to have seen the waters reach.' This remarkable fact may be compared with the state-

ment of Colonel Monteith (*Journal of a Tour through Azerdijan and the Shores of the Caspian*, in the third volume of the *Journal of the Royal Geographical Society*), that during his residence in that part of Asia from 1811 to 1828, the Caspian Sea, 'as well as every other lake in Persia, had decreased most sensibly in depth.'

From the foot of the Monghodjar mountains to the banks of the Syr-daria, a distance of more than 270 miles, not a single river traverses the sandy desert, which is covered with a number of shallow salt-water lakes, and has exactly the appearance of land from which the sea has retreated. These lakes are in some places dried up, and have left a cake of salt of dazzling whiteness, covering a surface of sometimes six or seven square miles. From the north-eastern part of the Aral Lake to the mouth of the Syr-daria, there is a great sandy desert called Cara-Coum (meaning *black sand*), which is in some places 175 miles broad. The country along the banks of the Syr, and especially near its mouth, is tolerably fertile, but that fertility is confined to a narrow band between the desert of Cara-Coum on the north, and one no less sterile on the south, the Kizil-Coum (or *red sand*), which extends to the banks of the Amou, an ocean of sand without one drop of fresh water. The base of the Kizil-Coum is an argillaceous red sandstone, which in some places rises above the surface; the plain is covered with sandy hillocks rising from twelve to sixty feet, and the view from the top of one of these is like looking over a stormy ocean transformed into sand.

The country between the Aral Lake and the Caspian, the Turcomanian isthmus, is but little known. Humboldt says that the southern prolongation of the Ural mountains may be followed from the table-land of Gouberlinsk near Orenbourg to Oust-ourt, between the Aral Lake and the Caspian. The chain of low hills of the Great Bourzouk, on the northern side of the lake, spreads out towards the west, and turning south extends through the isthmus to within ten days' journey of the town of Khiva; and there is a range of mountains in the isthmus called by the Kalmucks Mangislawski Gori. The caravans between Astracan and Khiva, and between Orenbourg and Khiva, pass through this isthmus, the route to Orenbourg lying along the shore of the Aral Lake, and the distance between the two places being about 470 miles. The English traveller, Thompson, who accompanied this caravan in 1740, describes the lake as being bounded on the north-west by rocky cliffs.

It has been supposed that the Aral Lake and the Caspian were at one time united; the Greek geographers appear to have been of this opinion, or rather were ignorant of the existence of the Aral Lake, for they make the Oxus and the Iaxartes flow into the eastern part of the Caspian. But until we are better acquainted with the structure of the isthmus, no sound opinion can be formed on the subject. That this part of Asia has undergone great changes in its physical structure, and that the relative position of land and water has materially altered since the existence of the Caspian Sea, there can be no doubt: but to what extent these have taken place within the historical æra can only be determined by a much more minute examination of the country than has yet been made, and by careful researches into the nature of the organic remains which are imbedded in the soil that has been abandoned by the waters. The narrowest part of the isthmus is not less than 150 miles wide, and a series of barometrical measurements by Messrs. Duhamel and Anjou of the French navy, from the Caspian to the Bay of Mertvoy Koultouk, on the western shore of the Aral Lake, have proved that the surface of the lake is 117 feet above that of the Caspian.

These steppes and sandy deserts cannot, from their nature, support a great variety of animals and plants. Violent heats in summer, succeeded by very rigorous winters, are unfavourable to the growth of trees or even of shrubs. Poplars and willows, which attain a height of five or six feet, are met with in groups in those oases where a river has overflowed its banks and deposited a covering of fertile soil, or where there are springs of fresh water. A species of tamarisk is common, and attains in favoured spots a height of twelve or fourteen feet. Liliaceous plants of the genera *hypoxis*, *iris*, *anthericum*, *asphodelus*, &c., are very generally diffused, and their bulbous roots are the principal food of the mammiferous quadrupeds found in these countries. These are chiefly of the smaller sized kinds, and such as burrow in the ground. Different species of the rat, mouse, dormouse, and marmot, are abundant, and the Baikal hare

is not uncommon. Among carnivorous animals there are different species of the fox, marten, weasel, &c. For the botany and zoology of these countries the reader may consult Pallas's *Travels*, and Dr. Pander's *Appendix to Meyendorff's Travels*; A. W. Kephallides, *De Historia Maris Caspii*; Engelhardt und Parrot, *Reise in den Kaukasus*; Meyendorff, *Voyage d'Orenbourg à Boukhara*; Humboldt, *Fragmens Asiaticques*.

ARALIA/CEÆ are a small natural order of plants, nearly related to the umbelliferous tribe, from which they are solely known by their young fruit consisting of more parts than two. They are frequently shrubby, and not uncommonly furnished with powerful hard prickles; but they often are also herbaceous and unarmed, like umbelliferous plants themselves. As an illustration of the order, the American ginseng, *Panax quinquefolium*, may be taken

[*Panax quinquefolium*.]

1. A barren flower. 2. A fertile flower. 3. Ovary and style.
4. Fruit cut in half, with the seeds projecting.
5. A section of a seed, showing its minute embryo.

This plant, which is nearly related to the celebrated stimulating drug called *ginseng* by the Chinese (see *PANACIA*), is found occasionally on the mountains of America, from Canada to the Carolinas. It has long since been introduced into our gardens, but it is now seldom seen. The natural order seems to possess little or no sensible properties, for the singular invigorating power ascribed to *ginseng* by the Chinese is considered to be apocryphal.

ARAM, אֲרָם, literally, the *high land*, is a geographical designation given in the Old Testament to all the countries between Phœnicia, Palestine, Arabia, the Tigris, and Armenia, or to those countries which the Greeks called Syria and Mesopotamia (Jer. vii. 8; 1 Kings xx. 26). ARAM was divided into

1. Aram of Damascus אֲרָם דַּמָּשְׁקִי, the territory of Damascus, whose rulers waged almost continual war with the Hebrews from the time of David to that of the Babylonian exile (2 Sam. viii. 6; 1 Kings xi. 24, seq.; xvi. 5, seq.).
2. אֲרָם צֹבָה, Aram-Zobah, which was, according to Syrian authorities, Nisibin, the Greek Nisibis. But this cannot be, because Nisibis is in Aram Naharaim, or Mesopotamia, which, according to Psal. lx., differs from Aram-Zobah. The passage to which we refer belongs to the

Israel, carried to Assyria by Shalmaneser, retained their former language, and caused it to spread in the neighbourhood of their places of residence, even before the destruction of the kingdom of Judah. At a later period, the Babylonish-Chaldean governors who ruled over Palestine; the standing forces which they had brought with them for the preservation of tranquillity, and which were composed of Aramæans and Chaldeans (2 Kings xxiv. 2); the host of foreign officers in their train, and the transactions of all public business in the Babylonish-Aramæan dialect, must have greatly tended to restrain the use of the national Hebrew dialect, since the Jews, who held public offices, or stood in any other near connexion with the new rulers, were compelled to become familiar with the ordinary dialect of these rulers. There is also reason to suppose that the Babylonish had still earlier been the court language at Jerusalem (see 2 Kings xviii. 26.)

The Aramæan language derives peculiar interest from having been spoken generally by the inhabitants of Palestine, from the Babylonian captivity to the final and general dispersion of the Jews. We find that Jesus Christ, when repeating on the cross the beginning of the twenty-second Psalm, does not quote the Hebrew original, but the Aramaic version. Many other occasional quotations and expressions used in the New Testament and in the writings of Josephus indicate the prevalence of the Aramaic language in Palestine in the age of Christ. The Greek, however, had been long firmly established in Palestine, where it was first introduced by the Macedonian conquests, and extended under the dynasty of the Seleucids. We know, both from positive testimony and the indirect evidence of inscriptions, &c., that Greek must have been as common in Palestine at this period as the French now is in Alsace, though it was no more the native tongue than the French now is in the province just mentioned. Greek was also the language of science and learning, as it contained nearly all the knowledge which at that time existed. Concerning the language of Palestine in the age of Christ, compare the dissertations of De Rossi and Pfannkuche, and a chapter in Hug's introduction to the New Testament; which have been translated partly in America, by Robinson, in the *Biblical Repository* for 1831, and partly in Edinburgh, in the *Biblical Cabinet*, 1833, vol. i. The standard work on the Aramaic language is, *Andree Theophili Hofmanni Grammatica Syriacæ libri tres, cum tabulis variæ Scripturæ Aramaicæ genera exhibentibus*, Halæ, 1827, 4to.

English readers may compare Yates's *Syriac Grammar*; Harris's *Chaldee Grammar*, 1824, 8vo.; and ספר השו"ס, a Hebrew and English Lexicon, containing all the words of the Old Testament, with the Chaldee words in Daniel, Ezra, and the Targums, and also the Talmudical and Rabbinical words derived from them, by Selig Newman, London, 1834, 8vo., price 21s.

Strabo calls the Aramæans (*Geogr.* i. p. 112, ed. Siebenk.) Ἀραμαιοὶ καὶ Ἀραμαιοί, and Ἀραμαιοί. Comp. Stephanus Byz. under Ἀραμ; and Gesenius, *Commentar zum Jesaiah*, t. i. 688, to chap. xxii. 6.

ARANDA, DON PEDRO PABLO ABARCA DE BOLEA, COUNT OF, descended from a very antient and noble family in Aragon, was born about the year 1718, and embraced the profession of arms. In 1743 he was severely wounded in an engagement against the Austrians, near Bologna in Italy, and left for dead on the field. The day after the battle one of his servants happened to pass by, and having recognised his master among a heap of bodies, procured him the necessary assistance. Aranda was appointed ambassador to Frederic Augustus II., elector of Saxony and king of Poland. On his return to Spain, he was sent to Portugal to supersede the Marquis of Sarria in the command of the Spanish army then invading Portugal. In August, 1762, he reduced Almeida and other places; and soon after peace was made. In 1765 Aranda was appointed captain-general of Valencia, and in the following year he was called to Madrid, that capital being then in a state of violent commotion against the minister Squillace. The conduct of Aranda in this emergency fully corresponded to the confidence placed in his talents. He was honoured with the presidency of the council of Castile. Not only was tranquillity restored in that capital, but by making a new municipal division of the city, by the establishment of a permanent garrison, and by other prudent regulations, the count prevented the recurrence of similar riots. During his travels in Europe, Aranda had improved his natural talents and knowledge.

In Prussia, he had devoted his attention in particular to examine the military tactics adopted by the great Frederic, which were then the admiration of Europe, with a view to apply them to the military system of his own country. With a courage, firmness, and perseverance which no obstacle could daunt, he undertook the reform of abuses in every branch of the administration, and the adoption of those improvements of which his country stood so much in need. He diminished the asylums, confining their number to two churches in the capital of every province, and he reformed the municipal system by the establishment of the *diputados del comun*, or, deputies of the commons. The coin, which was greatly debased, was called in and replaced by sound money; a new and improved plan was adopted for recruiting the army; the order of the Jesuits was abolished, and new houses of education established; and the thickets of the Sierra Morena, until then the abode of wolves and desperate banditti, were colonized with an industrious population of Germans, Swiss, and French, through the efforts of the philanthropic Olavide. Aranda also endeavoured to check the papal power in Spain by reforming the tribunal called the *sacristia*, which he composed of six native ecclesiastics proposed by the king, and confirmed by the pope, instead of a body of Roman jurists appointed by the pope alone, of which it formerly consisted; and by establishing a law that no papal decree should be valid in Spain without having first received the sanction of the council of Castile. The *pasos de semana santa*, or, holy week dramatic processions, the *rosarios*, and other pious or rather impious exhibitions, were also abolished by him. The power of the Inquisition was greatly diminished by the establishment of a political censorship, and, indeed, had it not been for the imprudence of the French encyclopædists, he would, perhaps, have abolished that sanguinary tribunal. When at Paris, Aranda frequented the society of Voltaire, D'Alembert, and other philosophers of that period, where he had often expressed his intention to abolish the Inquisition if ever he came into power. Not long after his appointment to the presidency of the council of Castile, an article appeared in some of the publications of the encyclopædists (see Coxe's *Memoirs*, vol. iv. ch. 67, p. 408, 4to. edit. 1815), wherein this confidential conversation was revealed to the world. When Aranda read this account, he was greatly vexed, and said, 'this imprudent disclosure will ruin me, and foil all my plans.' He was not mistaken in his conjecture: such a ferment was raised against him, that foreseeing his ruin unavoidable, he solicited to be appointed ambassador to France, and retired from the administration A.D. 1773. Aranda returned from Paris in November, 1787, but still remained in disgrace, with the honorary title of counsellor of state. After the accession of Charles IV. in 1788, Aranda superseded count Florida Blanca in the office of prime minister (1792); but he was not long after dismissed through the intrigues of Godoy. He remained, however, the presidency of the council of Castile until he was exiled to his native province, where he died, according to some authorities, in 1794, and according to others, what appear more to be depended on, in 1799, leaving behind him a young widow, without any children.

Aranda was a man of profound mind, and of a firmness characteristic of the Aragonese. Coxe relates the following anecdote. One day when Aranda was urging, with his usual perseverance, one of his measures of improvement, the king, who had exhausted all his objections against it, said: 'Count, you are as obstinate as an Aragonese man.' 'Please your majesty,' replied the minister, 'I know another who is more obstinate than I.' On the question 'who?' 'His sacred majesty, Charles III., king of Spain and the Indies,' answered Aranda. The king smiled at the reply of his minister, and dismissed him with his usual complacency. The Marquis Caraccioli compared Aranda's mind to a dew well with a narrow mouth. (See Coxe's *Memoirs of the House of Bourbon*, vol. iv. ch. 67.)

ARANEÆ. [See SPIDER.]

ARANJUEZ (Ara Jovis), a town in Spain near the confluence of the Tagus and Jarama, in a plain surrounded by high and bleak hills, in 40° 2' N. lat., 3° 36' W. long. twenty-six miles S.E. of Madrid. Aranjuez was once a country-residence of the master of the order of Santiago; it came afterwards into the possession of the crown, and the kings selected it for their residence during the spring months, on account of its advantageous situation and the mildness of its climate. Philip II. was the first king

who possessed it. The palace is a very handsome square building, with twenty-one windows in front, and a turret at each extremity. It was designed by the architect Juan de Herrera, and was begun under Philip II.; Philip V., Fernando VI., and Charles III. continued it, and Charles IV., who delighted in this residence, greatly contributed to its embellishment. The gardens, which are watered by the Tagus, are particularly admired for their natural beauties. In the time of the Peninsular war, this place suffered a truly Vandalic devastation. Not only the gardens were destroyed, but even the Ceres, a fine statue of the fountain of that name, entirely disappeared.

The town is of modern construction; the streets are broad, very well paved, and intersect each other at right angles. The actual population of Aranjuez amounts to 5245, which number is more than doubled during the residence of the court. In 1808, part of the ground, which had till that time been uncultivated, and was retained by the king as an appendage to the palace, was let to farmers, and brought into cultivation by them. From that period the population became more numerous; and the increased production of grain in consequence has had considerable influence on the markets of Madrid. Charles IV. established here a farm-house and menagerie, in which various foreign animals were very successfully reared. Trees and other productions of distant climates were also cultivated. The loss caused during the war has been partly repaired. (See Miñano; Ponz, carta v. vol. i.)

ARARAT (ԱՐԱՐԱՏ); the name of a region in the centre of the high-lands of Armenia, which was included in the former Persian province of Aran, but now in the present Russian government of Armenia (2 Kings xix. 37); the Armenians call it to this day Ararat. The mountains of this region are called the mountains of Ararat, on which the Ark rested (Gen. viii. 4). The whole of Armenia is called the kingdom of Ararat (Jer. li. 27). That Ararat was originally a name of the region appears from Moses of Chorene (*Compendium Geographia Universalis*, p. 46, 52), who derives the name from Araji Arat, *the spot of Araji*, who was king of Armenia in the days of Semiramis. (See Schroederi *Thesaurus Lingua Armenicae*, p. 55; and Moses Chorenensis, *Hist. Armen.* ed. Whiston, pp. 289, 308, 338, 361.)

The antient interpreters render אֲרָרָט, Ararat, in Genesis and 2 Kings, by the word Armenia, as Aquila did with Symmachus, Theodotion, and the Vulgate. At present the Armenians give the name Ararat in preference to that mountain, which they call also Macis or Massis, and the Persians, Koh-i-Nuh, the mountain of Noah. (See Wahl's *Asien*, pp. 518, 806, &c.; Gesenii *Thesaurus*.)

ARARAT, MOUNT, a celebrated mountain of Armenia, situated to the south-west of the town of Erivan, about five miles from the right bank of the river Aras, the antient Araxes. It rises majestically from the midst of a great plain, detached from the other mountains of the country, in two conical peaks, one of which rises far above the limit of eternal snow. Humboldt, on the authority of the Russian traveller, Parrot, states its height above the level of the sea to be 2700 toises, which is equal to 17,260 English feet. Thus it is 6389 feet higher than Ætna, 4792 feet higher than the volcanic peak of Teneriffe, and exceeds by 1528 feet Mont Blanc, the point of greatest elevation in Europe. It does not, however, ascend to this great height from its base, for it stands upon the table-land of Armenia, which is stated by Ritter to be 7000 feet above the level of the sea. The smaller cone is separated from the greater by a plain of great extent, and is considerably lower, for the snow disappears from its summit in summer, and it serves as a calendar to the surrounding people, who regulate their agricultural operations by the progress of the melting of the snow on the little Ararat. The appearance of this mountain is well described in the travels of Sir R. Ker Porter and of Mr. Morier. The former approached it from the north, and paints in glowing colours the magnificence of the spectacle when he first came in sight of Ararat, rising from a widely-extended green plain, fertilized by the clear waters of the Araxes, and covered with villages. He had the advantage of seeing it unveiled by clouds from its base to its summit, and the ice-clad cones shone with dazzling splendour against the clear blue expanse of the heavens. Mr. Morier, who approached it from the south, speaks in strong terms of admiration of the beauty of its form. Such a mountain must natu-

rally be seen from a vast distance, and it is said to serve as a landmark to the navigators of the Caspian sea. A remarkable circumstance, as connected with the traditions belonging to this mountain has been observed, namely, that when seen from afar and in certain positions, the summit has a striking resemblance to a ship. The whole country round is full of traditional stories about Noah's ark and the flood. The Armenians call Ararat, Massisseusar, or Mountain of the Ark, the Persians Koh-i-Nuh, or Mountain of Noah. It is a common belief that the remains of the ark still exist on the summit, and that the wood is converted into stone. In a church at Nova Schamachia, near the junction of the Aras with the Kur, they show a cross, made many centuries ago, out of a plank of the ark. Peter the Great, in 1720, sent some Armenians and Russians to ascertain the fact, and they reported that, to their amazement, nothing of the kind was to be seen. The report, however, in no way shook the faith of the true believers; who, with great reason, rested upon the conviction that the summit of the mountain is unapproachable. The Armenian monk who brought the plank from which the cross was formed, when nearly exhausted in his effort, was met by an angel, who had compassion on him, and handed to him the precious relic. The higher regions are usually covered with clouds, and when these are dispersed and the summit is unveiled, the devout Armenians fall on the ground, cross themselves, and pray. At Erivan, they show the spot where Noah first planted the vine, and the name of another town, Nachichevan, or Nakhdjovan, means, according to Chardin, 'place of descent,' being the place where Noah first settled when he came out of the ark.

Several attempts have been made to reach the top of the mountain, but no one has got much beyond the snow limit. The enterprising Tournefort, in 1700, made the attempt; but after undergoing great fatigue he was obliged to give it up. About twenty-five years ago, a Turkish pacha fitted out an expedition and built huts well supplied with provisions at different stations; but his people suffered severely in their struggle amid the snow and masses of ice in so rarefied an atmosphere, and returned without accomplishing their purpose. From all the accounts we have of its structure, there is little reason to doubt that Ararat is, partly at least, a volcanic mountain. Its conical shape and its detached position are in favour of this supposition. Tournefort, describing the ascent, says, that they passed over a great and beautiful plain to the base of the mountain; that at the beginning of the ascent they found moving sand, which continued for a great way up, their feet sinking in it so that they slipped back at each step, which made the ascent exceedingly laborious; that they afterwards came upon sharp fragments which cut their shoes to pieces, and then to large blocks piled upon one another. This description indicates a volcanic mountain covered with ashes and lava in a state of decomposition, but it is rendered still more clear by what Colonel Monteith says in his Memoir in the third volume of the *Journal of the Geographical Society*. He ascended some way up Mount Ararat, and says that he passed great quantities of pumice-stone. On the side of the greater cone there is a vast cleft, which Tournefort describes as a deep abyss, with lofty precipitous sides, and sharp pinnacles of black rock. This cleft is so great that it can be seen distinctly from Erivan; and between it and the foot of the mountain there is a succession of low round-topped eminences. One can hardly hesitate to consider this hollow as the crater of an eruption from the side of the mountain, an event which would be in accordance with the phenomena observed in all volcanos of great elevation; for in these, such as the Peak of Teneriffe and Ætna, there is seldom an eruption from the top, but almost always from the sides, as if the great mass heaped up by successive ejections afforded a greater resistance to the volcanic force than the sides. But no eruption, nor any indication of volcanic action, has been recorded within the historical æra. In the Chronicle kept by the monks of the monastery of Eitschmajadzen, in which everything relative to this sacred mountain has been carefully recorded for the last 800 years, there is no mention of any eruption. Many parts of the region around Ararat are decidedly volcanic: Sevellan, mountain 13,000 feet high, between Ararat and the Caspian, is volcanic, and Colonel Monteith thinks that it has perhaps been the latest in activity in that country. Extensive beds of lava are visible on its side, and there are warm springs all round the base. The same traveller, describing the lake of Goukèka, or Sevan, a body of water 47 miles long,

and in some places 21 broad, situated eastward of Erivan and between Ararat and Sevellan, says, that he found on its banks high perpendicular cliffs of lava, vast quantities of obsidian or volcanic glass scattered over the country, and the shore of the lake covered with pumice-stone, light enough to float on the water.

A remarkable circumstance is mentioned by Tournefort connected with Mount Ararat, namely, that the middle region, and even the borders of the snow limit, are inhabited by tigers. He says that he saw them within 700 yards of him, and that he and his people threw themselves on the ground for the sake of concealment while the tigers passed by. He adds that the young ones are caught in traps by the people round the mountain to be exhibited in shows of wild beasts throughout Persia. (Tournefort, *Voyage dans le Levant*; Sir R. Ker Porter's *Travels*; Mr. Morier's *Travels*; Humboldt, *Fragments Asiatiques*; Von Hoff, *Geschichte der Veränderungen der Erdoberfläche*; Monteith's *Tour through Azerbaijan, &c.*)

ARARAT, or PILOT MOUNTAIN. [See NORTH CAROLINA.]

ARAS, or ERAS, is a large river of Armenia, mentioned by Greek and Roman writers under the name of Araxes. It rises at Dekman in Mount Bin-Gheul, from a number of sources, about 20 miles S.E. of Erzerum, and about 39° 47' N. lat., 41° 9' E. long. A branch of the North Frat or Euphrates rises on the opposite or western side of the same elevation, a fact known to Pliny (vi. 9). Its general course from this point is east, with a slight deviation to the north, through Basen and along the borders of the province of Cars to within eight or ten miles of Erivan, at a place called Sahathaphos. From this point it takes a bend to the S.E. (passing the eastern base of Ararat) as far as the ruins of old Julfa in the province of Nakhdjovan: at Sahathaphos, the frontier of Erivan, its breadth, according to Tournefort, is about equal to that of the Seine at Paris. Erivan and Nakhdjovan are now in the Russian province of Armenia, which was ceded by Persia in 1828. Between the bend to the S.E. and the latitude of Ararat, the river makes numerous windings. From the ruins of Julfa (within a few miles, the most southern point of the river's course) the general course of the river is E. to the limits of Khaphan, where it turns N.E., running in this part of its course, with some considerable bends, through part of Nakhdjovan, Kaphan, and the Karabagh to near Jevat, where it is joined by the Kur (Cyrus) coming from the Caucasus. The united stream, after running about thirty miles east, turns suddenly to the south, and enters the Caspian Lake by three mouths (about 39° 20' N. lat.); a long projecting tongue of land, or delta, is here formed between the Caspian on the east, and the small gulf of Kizilgatch on the west. After its junction with the Kur, the river separates Great Armenia on the south from Shirvan, and part of the antient Albania on the north. Its length cannot be less than 600 or 700 miles, if its general course on our maps is correct; but the Djihan-Numa assigns to it a length of only 150 parasangs.

The Araxes receives numerous tributaries, but none of them are of any considerable magnitude compared with the chief stream: on the north side, the Hassan-Caleh in Basen, the Dehenkli, which comes from a lake of the same name in Cars, and the Arpatchai (according to Rennel, the Harpasus of Xenophon, *Anab.* iv. 7) in the same province; the Arpatchai runs in a deep ravine, with numerous ruined castles on its high banks; the Zenghi, one branch of which flows from the large lake Sevan, said to be about 5000 feet above the sea, runs past Erivan, and joins the Araxes twenty-four miles from this town; the river of Nakhdjovan, &c. Other streams of about the same size, but fewer in number, enter it on the south bank. There is a bridge at Dekman, one in the province of Basen, a third at Khaphan, and a fourth at Jevat, below the junction of the Kur. There was a bridge at Julfa (38° 54' N. lat.), of which the ruins remain, and similar traces of bridges are seen in other parts of the river. The Aras, when not swollen by sudden rains or the melting of the snow on the high mountains of Armenia, is easily passed either in boats or at the fords, particularly in the upper parts; but in its swollen state the current is extremely impetuous and dangerous. In Khaphan there is a considerable cataract at a place called Erespar; it is said (*Journal Asiatique*), that the fall leaves at the bottom a space wide enough to allow men and a whole caravan to pass. But there is pro-

bably some exaggeration in this statement, if these falls are the same which Colonel Monteith describes as not more than six feet high, and which he considers to be the falls of Erespar, or Aras Bar. This is probably the cataract alluded to by Strabo (p. 531), according to whom there was an old tradition, that the Araxes, after its exit from the high mountain region, spread out into a great lake, till at length a rent was effected in the mountain barrier like that which made a passage for the waters of the Peneus in Thessaly, and the plain was drained. The position of this cataract appears also to correspond to the great break in the mountain chain which Colonel Monteith places about forty miles below Julfa. (See Monteith's *Map*, and Rennell's *Atlas*.)

Many of the affluents of the Araxes rise in mountains covered with oaks, pines, and firs. The water of the river is pure and wholesome. It abounds in a great variety of excellent fish, of which the chief are the janar, a fish of large size and delicate flavour, met with in the province of Basen; the leog, still larger than the janar, a long slender-shaped fish; the degihin-port, which sometimes weighs an okha (45 ounces, if that of Constantinople is meant), and the cararakhet (red-skin), so called from its external colour, but the flesh itself is white.

The Araxes was known to Herodotus, though only from hearsay (i. 202, iv. 40); he describes it as flowing eastward from the country of the Matiæni, and dividing at its approach to the Caspian into forty channels, only one of which made its way clear to the Lake, the rest being obstructed so as to form swamps. This seems in substance to agree with Strabo's description of the outlets of the Cyrus and the Araxes (p. 501). It is a question much disputed, what river Herodotus means by the Araxes; but we think there is little doubt that he meant the Aras of Armenia. If this supposition will not reconcile all the difficulties, as it certainly will not, his ignorance of the regions bordering on the west, east, and south of the Caspian, helps to complete the solution of our difficulties. (See Mannert, *Geog. der Griechen und Römer, Armenien*.)

Strabo, according to the fashion of his countrymen, explains the word Araxes as being of Greek origin, and having reference (according to its supposed derivation from *ἀραξω*, to strike, or break) to the gap where it passes through the mountains. 'The Peneus of Thessaly,' he adds, 'was once called Araxes on account of its having separated (ἐκ τῆς ἀπαρπάξεως) Ossa from Olympus by forming the gorge of Tempe.' Such remarks are mere trifling; and it is more important to observe that the name Araxes was given to various rivers and places in countries widely separated. An Araxes (now the *Bund Emir*) flowed through mountainous Persia and entered the Lake of Bakhtegan. Xenophon, in his *Anabasis*, gives the name of Araxes to the Aborras or Chaborras, now the Khabour, an affluent of the Euphrates. Araxus was also the name of a promontory on the N.W. coast of the Peloponnesus, near the confines of Elis and Achæa. (See *Journal Asiatique de Paris*, No. 71, 1833; *Journal of London Geographical Society*, vol. iii.)

ARATUS, the author of an astronomical poem in Greek, which has come down to us. Neither the date of his birth nor death is exactly known; but, from other circumstances, we infer that he must have been alive in the 125th Olympiad, that is, he lived about the time of the first Punic war, and must be placed, as to the time of his notoriety, between Euclid and Apollonius of Perga, with both of whom, in the most extended sense, he may have been contemporary. The materials for his life are chiefly collected from an anonymous account of him in Greek, printed by Petavius in the *Uranologion*, and various scattered notices and allusions in classical authors. There are, in fact, three anonymous lives of Aratus, besides the notices in Suidas and Eudocia. All that is worth recording amounts to this, that he was certainly born in Cilicia, some say at Tarsus, others at Seba (afterwards called Pompeiopolis); that his calling was medicine; that he was invited to the court of Antigonus Gonatas, king of Macedon, son of Demetrius Poliorcetes, where he passed the rest of his days. It is also stated that he was educated by a Stoic named Dionysius Heraclæotes in the principles of that sect.

By the desire of Antigonus, Aratus turned the *Phænomena* of Eudoxus into verse. It does not appear whether he had any remarkable astronomical qualification for the task. It is a question whether he made any original observations or not; but it is certain, from the commentary of the celebrated Hipparchus, which is yet extant, that he made many alterations.

tions; for this commentator frequently cites the prose of Eudoxus and the poetry of Aratus together. The work of the former has not come down to us; in fact, Aratus is the second Greek writer on astronomy extant, Autolycus being the first. We are inclined to think that Aratus was neither an observer nor a mathematician, and for this reason, that, in his description of celestial phenomena, he uses no higher degree of precision than might have been attained by a mere spectator of the heavens. For instance: he describes the head of the dragon as never setting, but only just touching the waves. This, at his æra, answered to a latitude of $38^{\circ} 7'$; but, in another place, he describes the intersection of the northern tropic and the horizon as if he was in latitude $40^{\circ} 54'$, more than $2\frac{1}{2}^{\circ}$ greater than the former. The second latitude answers to some of the southern parts of Macedonia.

The poem of Aratus is divided into two parts; the *φαινόμενα* or *Phænomena*, and the *διοσφητα* or *Prognostics*; the first contains 732 lines, the second 417. It opens with a declaration of the dependence of all things upon Jupiter, *whose children all men are*, and who has given the stars as the guides of agriculture. The passage in italics (*τῷ γὰρ καὶ γένος ἑμῶν*) is remarkable as having been, at a much later period, quoted by St. Paul in his address to an Athenian audience (Acts of the Apostles, chap. xvii. v. 28), 'For in him we live, and move, and have our being: as certain also of *your own* poets have said, For we are also his offspring.' If the words in italics represent the correct text, they remarkably serve to show the notoriety of the poem, if it be recollected that Paul was a countryman of Aratus; but some manuscripts of the New Testament (see Griesbach's edition) support the reading *καὶ ἡμᾶς*.

Aratus then proceeds to lay down the doctrine of the immovability of the earth and the motion of the heavens round a fixed axis. He describes the names and configurations of all the constellations then in use, their relative times of rising and setting, the march of the sun through the zodiac, and the milky way, which is described as one of the great circles of the heavens. The planets are simply mentioned as bodies having a motion of their own, but no idea is given of the length of periods. There is nothing on the orbit of the moon, or on the unequal motion of the sun in longitude. There are many mistakes as to the placing of the stars; for example, it is said that Lyra has none but small, and Cygnus none but moderate, stars, though there is one of the first magnitude in both. There are various phenomena which are irreconcilable with any one latitude, an instance of which we have noticed; and there are others which could not have coexisted at any one epoch; for example, his separate description of the winter and summer solstice belongs to periods distant by 900 years from each other.

The book of *Prognostics* consists of predictions of the weather from observation of astronomical phenomena: except that the celebrated cycle of 19 years is mentioned in it, it adds nothing to our knowledge of the existing state of astronomy. It contains various accounts of the effect of weather upon animals, with directions, and is, on the whole, more like the *Georgics* of Virgil than any other poem of antiquity. The latter work contains several imitations of the *Prognostics*. There is not a word of astrology either in the *Phænomena* or the *Prognostics*.

Aratus is also said to have written poems on Homer, on the *Iliad*, on osteology, on medicine, a hymn to Pan, a funeral ode on his brother Myris, and a poem called *Σκυθικὸν* or *Scythian*. More than thirty epistles of his were extant at the time of his anonymous biographer.

The number of commentators upon Aratus is very great. The elegance of the verse caused his work to be for a long time in circulation among the Greeks. Petavius gives a list of thirty-six commentaries in Greek; among the authors of which are Aristarchus, Geminus, Eratosthenes, and Hipparchus. The last has come down to us, and owes its origin to the difference which Hipparchus had observed between the descriptions of Aratus and his own observations. According to his account, Aratus had frequently altered Eudoxus for the worse; but the latter is also shown to have so far fallen short of what might have been expected even with the then existing means of observation, that Delambre conjectures the whole system to have been formed, not from the heavens, but from a globe, on which the stars had been incorrectly laid down.

A full account as well of Aratus as of his commentators will be found in Delambre's *Histoire de l'Astronomie An-*

cienne. The anonymous *Life of Aratus*, is, as before noticed, in the *Uranologion* of Petavius, together with the commentary of Hipparchus and another, which has been attributed sometimes to Hipparchus, sometimes to Eratosthenes, but which is given by Petavius to Achilles Tatius.

The *Phænomena* was translated into Latin by Cicero when a very young man. Several fragments of this translation still exist, and are given by Grotius in his edition of Aratus. It was also translated by Germanicus Cæsar and by Festus Avienus, both of which versions are to be found in the same edition, which was published at Leyden in 1600, and contains also the original Greek with notes.

There are numerous editions of Aratus. The first is by the elder Aldus, Venice, 1499, folio; this edition contains other writers on astronomy. The latest is by Bekker, with scholia, Berlin, 1828, 8vo. J. H. Voss published a critical edition of the Greek text of Aratus, at Heidelberg, 1824, 8vo., and accompanied it with an excellent German poetical version.

ARATUS, son of Cleinias, was born at Sicyon 271 B.C. His native city, distinguished in the history of Greece as a school of art more than for its political importance, had long been harassed by the conflicting pretensions of various persons, who in succession became, to use the language of Greece, its tyrants or princes. Cleinias held that precarious dignity for a short time: but he was killed by Abantidas, who assumed his power, and suffering a like fate gave way to Pseas, who was succeeded by Nicocles. Aratus was but seven years old at his father's death. He fled in the tumult, and falling into humane and honourable keeping, was concealed for a time, and then conveyed to Argos. There he grew up to manhood, distinguished for his bodily powers, a frequenter of the *palæstra*, or place of exercises, and a frequent victor in the rough games which the youth of Greece loved to practise and were proud to excel in. When Nicocles succeeded to the tyranny, Aratus was just entering upon manhood, and he became the object of that person's especial fear. This jealousy was not unfounded. Aratus already meditated the bold enterprise of restoring himself to his native country; and he endeavoured to associate in his views the numerous exiles who had been banished from Sicyon in its successive changes of masters. A few only joined him; the greater number doubted the capacity of the young and inexperienced plotter to conduct such an enterprise, and shrunk from its dangers. He persevered however, and carried on his design with secrecy and boldness. He deceived the spies whom Nicocles employed to watch his motions, by an affectation of careless and riotous extravagance; and when his plans were ripe, he made a night march from Argos to Sicyon, with a small number of followers, whom his own resources, and those of his friends, enabled him to arm and retain. The details of this spirited enterprise may be read with pleasure in his life by Plutarch; he succeeded in scaling the walls, forced his way to the tyrant's residence, and mastered his guard. Nicocles escaped by secret passages. Aratus immediately sent round the city to summon his friends; and at break of day the population assembled in the theatre, where proclamation was made that Aratus, son of Cleinias, invited the citizens to resume their liberties. This striking revolution was effected, B.C. 251, without the loss of a single life, either in the heat of contest or as a measure of policy or revenge. Still the new order of things was far from being safely established. Both justice and expedience prompted the restoration of all exiles to their civil rights: and those who returned, in number near 600, naturally sought to recover the possessions which they had formerly enjoyed. This difficulty of adjusting the conflicting claims of emigrants and actual possessors was recently experienced in France, after the restoration of the Bourbons. Aratus, seeing the newly-recovered liberty of Sicyon threatened at once by civil discord and by the ambition of Antigonus Gonatas, king of Macedonia, whose policy was directed to the establishment of tyrants in all the Grecian cities, gave up something of independence for greater security, and procured the enrolment of Sicyon as a member of the Achæan confederacy. [See ACHÆI.] Aratus had cultivated the friendship of Ptolemy Euergetes, king of Egypt, by sending presents of the most valuable productions of Grecian art; and he now undertook a voyage to Egypt, and gained so much upon the king's esteem, that he presented him with a large sum of money (150 talents), the whole of which Aratus employed, on his return to Greece,

in satisfying the indigent exiles, and re-establishing concord. He was appointed commissioner, with full power to adjudicate all questions connected with their claims. Unwilling, however, to bear the whole responsibility, he associated fifteen citizens in the task; which was fulfilled with so much justice and liberality, that the restored exiles erected a brazen statue of him, with a laudatory inscription, in testimony of their gratitude.

The talents and services, and perhaps the intrigues, of Aratus soon made him captain-general (*strategus*) of the Achæan league; which under his prudent counsels grew up from a confederacy of a few insignificant cities for mutual defence into a formidable body exercising a powerful influence in Greece. He held this office for the first time B.C. 245; in which year he invaded Locris and Calydonia, on the northern side of the Corinthian gulf. Being re-elected in 243, after the necessary interval of a year, he conceived the project of wresting Corinth from Antigonos. The Acrocorinthus, or citadel, was considered the key of southern Greece. Antigonos, after long coveting, at last gained possession of it by treachery, and held it with a strong garrison. But the faithlessness of two soldiers in his service disclosed a weak point in the fortifications and a practicable path up the precipitous mountain; and Aratus undertook the bold enterprise of mastering the strongest fortress of Greece, by night, with only 400 men. For the particulars of this remarkable escalade we must again refer the reader to Plutarch. It proved successful, though not without much difficulty; and the advantage gained was secured by the arrival of a larger body of Achæan troops, to whom the Corinthians gladly gave admittance. Early in the morning the citizens assembled in the theatre, and Aratus, appearing on the stage in his armour, was received with the warmest demonstrations of joy and gratitude. He restored to them the keys of the city, which, since the reign of Philip of Macedon, they had not had in keeping, and invited them to join the Achæan league. They acceded to the proposal; and the Acrocorinthus was thenceforward occupied by an Achæan garrison. Aratus also gained possession of Lechæum, one of the ports of Corinth, and before the end of his year of office prevailed on the state of Megaris to join the league. Troezen and Epidaurus soon followed the example, and the confederacy was further strengthened by the friendship and support of the king of Egypt.

The powerful city of Argos had long been held by a succession of tyrants. To re-establish the commonwealth was a favourite object with Aratus; and he made several attempts, which proved abortive, not being seconded by the temper and wishes of the people. It was not until B.C. 227 that Aristomachus, being tyrant for the time, was induced by the counsels of Aratus to resign his power, and bring over Argos to the Achæan league. Cleonæ, an antient city of the Argian territory, had become a member of it some time before. Philus was admitted to it at the same time. The resignation of Aristomachus was probably prompted by the example of Lysias, tyrant of Megalopolis, who, emulating the virtues and the reputation of Aratus (if Plutarch rightly represents his motives), had retired into private life, and induced his city to join the league, B.C. 232. Lysias was rewarded by the popular favour, and was three times chosen *strategus*, alternately with Aratus. Each probably felt jealous of the other, for continual bickerings existed between them. Lysias was killed in battle with the Lacedæmonians, about B.C. 225.

In prosecution of his favourite policy, Aratus made several attempts to drive the Macedonians from Athens. That which he could not obtain by arms, he effected by money, soon after Antigonos, surnamed Doson, began to reign, B.C. 237, when Diogenes, the Macedonian governor, delivered up the fortresses which he held, together with the isle of Salamis, for a bribe of 150 talents, of which Aratus contributed twenty from his private fortune. At the same time Ægina, Hermione, and a considerable part of Arcadia joined the Achæan league.

It will be seen, on reference to the map of Greece, that during a period of about twenty years, in which the affairs of the Achæan league had been chiefly managed by Aratus, that body had grown up from the union of a few weak cities for mutual defence into a powerful confederation, including the whole northern coast of Peloponnesus from the promontory of Araxus to Scyllæum, with the lands of Corinth and Megara, and the greater part of Arcadia. This change was wrought, in a great measure, by the probity and high personal

character of Aratus; who, as we are told by Plutarch, even during those years when the forms of the constitution prevented his having the name of *strategus*, still had the authority of the office, 'because the people saw that he set neither glory, nor wealth, nor the friendship of kings, nor the good of his own country, nor any other thing, before the general advantage of the Achæan league.' Accordingly, he was elected general oftener, it should seem, than the law strictly allowed; for in a period of thirty years from his first elevation, B.C. 245, to his death, B.C. 213, he held the office seventeen times. The leading feature of his policy was the expulsion of those petty tyrants whom it had been the favourite object of the Macedonian kings to establish in all the cities of Greece, as the readiest way of retaining them in subjection; to exclude the Macedonians from Peloponnesus; and to give vigour to the Greek nation by uniting them in one confederacy of well-organized commonwealths. We have seen that he succeeded to a great extent in this virtuous, and judicious, and truly patriotic design. But he was constantly opposed by the Macedonian kings, Antigonos and his son Demetrius, and very frequently by the Ætolians, a warlike and turbulent people, who derived much of their wealth from plunder, and were ever opposed to peace and to good order. Hence, though sometimes led to alliance with the Achæans by a common jealousy of the power of Macedon, they were much more frequently arrayed against them; and in one of their predatory incursions into Peloponnesus, they were defeated by Aratus at Pellene with considerable slaughter. By this victory Aratus acquired considerable renown: for the most part, however, he was unsuccessful in the open field, and cautious to excess in his movements; a singular fault in one who was so bold in attempting, and so successful in effecting, the capture of the strongest fortresses by sudden assault, a species of enterprise in which, above all others, prompt contrivance and bold execution are required. His personal courage did not escape unquestioned, and in certain circumstances he doubtless betrayed a weakness and want of steady purpose. He seems to have done best where he had least time for reflection; he saw and did what was expedient on the spur of the moment, but hesitated and became perplexed where he had time to deliberate: so that, according to Polybius, qualities totally opposite were united in him, and in different circumstances he was no longer the same man.

Shortly after the accession of Argos to the Achæan league, war broke out (B.C. 226) between the Lacedæmonians and Achæans; a war to which neither party seems to have been averse. The Achæans looked with contempt upon the youth of Cleomenes, king of Sparta; and Cleomenes was both desirous of military fame, and hoped to find in the events of war some favourable opportunity for effecting the civil changes at home which he desired. Aristomachus, the late tyrant of Argos, was *strategus* when the war began. Aratus had dissuaded him from engaging in it, and had sufficient influence to prevent his giving battle when the hostile armies were first opposed to each other at Pallantium, in Arcadia, though the Achæans were 20,000 strong, and the Lacedæmonian army consisted of only 5000 men. This raised the spirits of the Lacedæmonians, and in the following campaigns Cleomenes was generally successful. He defeated Aratus in the next year at Mount Lyceum in Arcadia; but the Achæan general retrieved this mishap by gaining possession of Mantinea in his retreat. Soon after, another battle was won by Cleomenes under the walls of Megalopolis, in which Lysias was killed; and on this occasion Aratus was loudly, and it should seem justly, censured for his slackness and want of enterprise. The war languished while Cleomenes was occupied by the revolution in Sparta; but when that was completed, he resumed his successful career. He regained Mantinea, invaded Achæa, and won a great victory at Dyme; he took Pellene and some other towns; Argos, Philus, Epidaurus, Troezen, Hermione, went over to him; and Corinth passed into his hands, with the exception of the Acrocorinthus, which still remained in custody of the Achæans. Aratus, though re-elected, had refused to accept the office of *strategus*, whether from anger at some censures which had been passed on him after his late defeats, or from a fear of being unable to extricate the Achæans from the difficulties in which the war with Sparta had involved them. He was much censured, both in his own time and afterwards, for having brought the vessel of the state into danger, and then abandoning the helm to others. Though ostensibly in a private station, he

continued to exercise his usual controlling influence. To extricate himself from the difficulties in which he was involved, he adopted the disgraceful expedient of inviting back the Macedonians, whom he had been at so much pains to expel from the Peloponnesus. He had been already engaged in negotiation with Antigonus Doson, during that course of successes which put Argos and so many other places into the hands of Cleomenes. Having prepared the way for reconciliation, and ascertained that Antigonus was not unwilling to form an alliance with the Achæans after the battle of Dyme, he advised them to make a formal application to that monarch for assistance. Antigonus, however, required that the Acrocorinth should be placed in his hands as the price of his services; and this open invasion of the liberties of Corinth, a confederate city, could not be tolerated. But the voluntary revolt of the Corinthians removed this difficulty, and the Achæans forthwith transferred the citadel to the custody of Antigonus. Cleomenes took up a station to defend the Isthmus, but he was obliged to abandon it in consequence of a counter-revolution at Argos, which returned to the Achæan alliance, and Antigonus entered Peloponnesus unopposed (B.C. 224). He took several cities in Arcadia, which he delivered to the Megalopolitans, and going to Ægium to confer with the Achæan congress, was appointed commander-in-chief of the confederate army. In the following year he took Tegea, Orchomenus, and Mantinea; but this success was counterbalanced by the loss of Megalopolis, which Cleomenes plundered, and almost destroyed. In the following year, B.C. 222, Antigonus defeated Cleomenes in the decisive battle of Sellasia, which put an end to the war. The Macedonian king entered unopposed into Sparta, but he treated it with respect, and contented himself with undoing the changes which Cleomenes had made. Cleomenes fled to Egypt, where he died, and Antigonus died shortly after in Macedonia, enjoining Philip, his nephew and successor, to regulate his policy in Greece strictly by the counsels of Aratus.

Peace followed the battle of Sellasia, and for a time Peloponnesus was quiet. This, however, was of short duration. Of the character of the Ætolian tribes we have already spoken. Sometimes in alliance, sometimes at war, with the Achæans, as their interest prompted, they were never in firm friendship with a people whose conduct was directed in the main to the upholding of peace and order, while they led themselves a life of rapine, gathering by the strong hand those luxuries from their neighbours which they were too indolent or ignorant to procure by honest industry. A series of gross provocations induced the Achæans to declare war against these turbulent mountaineers. Aratus took an active part in urging this measure, and being elected strategus for the ensuing year (it was near the period of changing officers when these transactions occurred), he anticipated by five days the proper time for entering on his office, that he might hasten his march against the Ætolians, who were already engaged in ravaging Messenia. He failed signally in the conduct of this campaign: once at Caphyæ, by giving battle too hastily, in which he was defeated, B.C. 220; afterwards by suffering the enemy to continue their depredations unchecked, and neglecting opportunities of which a more active general would have availed himself. Great complaints were made at the next congress; and Aratus himself seems to have been sensible that his conduct was open to exception, since, in defending himself, he urged his former services as a plea for passing lightly over his error, if it should be judged that any fault had been committed by him. The appeal was probably successful; and he continued to retain his wonted influence.

In the course of this war, Philip II., the young king of Macedonia, acted as general of the Macedonian and Achæan army. For some time he observed his uncle's dying commands, and regulated his own conduct strictly after the counsels of Aratus; and he displayed such ability, prudence, and justice, as gave rise to the fairest expectations of his reign. Some however of his confidential ministers, jealous of the influence, and opposed to the views of Aratus, used every means to destroy that statesman's weight with their prince, and they induced Philip to procure the election of Eperatus as strategus, an avowed opponent of Aratus, to the exclusion of Aratus himself. This interference produced much discontent among the Achæans. The successful candidate was a person of little estimation, and humble ability, and affairs went on so ill in his hands, that Philip was forced to seek a reconciliation with Aratus.

The war was then prosecuted with success both in Ætolia and Peloponnesus. All parties, however, became desirous of peace. Philip sought to take advantage of the distress to which the Romans were reduced by Hannibal; the Achæans wished to conclude peace while the advantage was on their side; and the Ætolians were glad to put an end to a struggle in which they had the worst. Peace was concluded B.C. 217, each party retaining what they then possessed.

The extensive prospects of ambition opened to the Macedonian king brought to light the seeds of evil in his character. Hitherto his conduct towards his Grecian allies had been generous and faithful; henceforth his desire was to reduce all Greece under his power, and he scrupled at few things which promised to forward his views. The counsels of Aratus became distasteful to him, and the authority which that statesman had insensibly acquired over him became irksome. Latterly indeed the policy of Philip became so hateful, that Aratus withdrew entirely from his court and society, fearing to incur the odium of the crimes which he was constantly committing. Still the recollection of Aratus checked, and rendered him uneasy; and to rid himself of this restraint (if Plutarch's tale be true, and it is confirmed by Polybius), he procured the death of his old friend and guide by a slow poison. Aratus felt the blow, and knew the author; but feeling that complaint was useless, he endured it in silence, with the single exception that he once observed to a friend who was shocked at seeing him spit blood, 'Such, Cephalon, are the rewards of the friendship of kings.' (Polyb. viii. 14.) He died B.C. 213. The honour of being his burial-place was disputed between Sicyon and Ægium in Achæa, where he died, and adjudged by the Delphian oracle to the former. He was splendidly interred there, and a monument erected to him. He was honoured by the Sicyonians as the father, founder, and saviour of their city; and twice a year, on the anniversary of his birth, and of the restoration of liberty to the city, a religious festival was celebrated in his honour.

He wrote a history of his own times, entitled *Commentaries* (ending with the year 220), which, unfortunately, have not come down to us. It has received high praise from Polybius, as containing 'very faithful and clear memorials of his own times'; and from the close of this work Polybius chose to commence his own history. Particulars of the life of Aratus will be found in Polybius, lib. ii. to ix. inclusive; and in Plutarch, *Lives of Aratus, and Cleomenes*.

There is a chapter devoted to this subject in the *Encyclopædia Metropolitana*, from which the dates here given sometimes vary. We have followed our usual guide, Clinton, in his '*Fasti Hellenici*, from the 124th Olymp. to the death of Augustus.' See also Schlosser's *Universalhistorische Uebersicht* (ii. 1.), whose judgment on the character of Aratus is unfavourable, and perhaps just.

ARAUCANIANS, the name given to a South American tribe, inhabiting a country comprised between 36° 44' and 39° 50' S. lat., and 70° and 74° 30' W. long., and bounded on the E. by the great Cordillera of the Andes, by the Pacific Ocean on the W., by the river Bio-bio on the N., and by the Valdivia or Callacalla on the S. It extends about 186 miles along the coast; the breadth from the sea to the crest of the Andes is perhaps about 150 miles. The people take the name of Araucanians from the province of Arauco, which is the smallest in the state; and pride themselves in being called Auca, which, according to Molina, means frank, or free. The Spaniards, who had served in the Netherlands, and afterwards fought in Chili, called the country Araucanian Flanders, or the Invincible State. The productions of the soil are in general the same as those of Chili.

The territory of Araucania has been divided from time immemorial from north to south into four parallel *vuthan-mapus* (otherwise written *uthalmapus*), or tetrarchies, almost equal in extent, which are called *lauguén-mapu* or the maritime country, *levun-mapu* or plain country, *inapiro-mapu* or country at the foot of the Andes, and *pire-mapu* or country of the Andes. Every *vuthan-mapu* is subdivided into five *illarehues* or provinces, and every *illarehue* into nine *rehues* or districts. The maritime country comprises the provinces of Arauco, Jucapel, Illicura, Boroa, and Nagtolten. The plain country includes those of Encol, Puren, Repocura, Maquegua, and Mariquina. That at the foot of the Andes comprises the districts of Marven, Colhue, Chacaiuco, Quecheregua, and Guanagua. The province of the

Andes was formerly possessed by a separate tribe, called Puelches, which afterwards became united to the Araucanians.

The government of the Araucanians is aristocratical, and is composed of three orders: the *toquis*, the *apo-ulmenes*, and the *ulmenes*. The *toquis* are four independent chiefs, every one presiding over one *vuthan-mapu*; their name is derived from the verb *toquin*, to judge or rule. Though independent of one another, they form a federal union for the public welfare. The *apo-ulmenes* have the command of the provinces under their respective *toquis*, and the *ulmenes* preside over the *rehues* or districts. The badge or device of the *toqui* is a porphyry or marble axe. The *apo-ulmenes* and *ulmenes* have staves with silver heads, but the former are distinguished by a silver ring round the middle of their staves. All these dignities are hereditary in the male line, in the order of primogeniture. The *toquis* possess but a shadow of sovereignty; the real power resides in the *vutacoyag*, or *aucacoyag*, the great council, or council of the Araucanians. This diet is composed of the *toquis*, the *apo-ulmenes* and *ulmenes*, and is held in some plain or valley, whenever any affair of importance is to be decided upon. Previous to their meeting they have their games and sports.

Their *admapu* or code of laws consists simply of traditional customs. The laws which are the most distinctly defined are those which regard the district of every *toqui*, and the succession and union of the tetrarchies. The election of the principal officers in time of war and the convocation of the diet reside in the *toquis*. No *toqui* can ever rule over more than one tetrarchy. The subjects are not bound to render their chief any sort of personal service except in time of war; he supports himself by his own private property. When the male line of the chief becomes extinct, the people choose another ruler out of the family that is most agreeable to them, but before giving the new sovereign his power, they present him to the other *toquis* to be acknowledged by them.

The crimes which are visited with the greatest severity of the law are treason, murder, adultery, theft, when to any considerable amount, and witchcraft: the murderer may escape punishment by compounding with the offended family. Fathers possess the right of punishing their children, or any other individual of their family, even with death, whenever they may think proper. The sorcerer is first tortured by fire in order to compel him to declare his accomplices, and then stabbed. The smaller crimes are punished by the law of retaliation, called by them *thaulonco*. Any one found guilty of a capital offence is immediately put to death, prisons not being in general use when Molina wrote.

The military government of the Araucanians, though not more complete than the civil and criminal codes, shows a considerable degree of intelligence. When the council has decided upon war, they proceed to choose a commander from among the four *toquis*, but if none of them possess the necessary qualifications, an *ulmen*, or even any other inferior officer, is chosen. The general having accepted the office, assumes the title of *toqui*, and takes the axe, which all the other *toquis* are obliged to lay down during the time of his dictatorship. This ceases with the war. Both the *toquis* and all the other officers swear allegiance to him: the general then appoints a vice-*toqui* and the officers of his staff, the latter nominating their subaltern officers. The vice-*toqui* is generally taken from the tribe of the Puelches. A messenger, called *huerquen*, is then sent to announce the war to the friendly tribes, and even to the Indians who live among the Spaniards. His credentials consist in a small bundle of arrows tied with a red thread; if the war has already begun, they put in the centre the finger of a dead enemy. This expedition is called the *pülquitun* or running the arrow, and is done with such secrecy, particularly in the possessions of the Spaniards, that it has rarely been discovered. The dictator then requires from each of the *toquis* his allotted contingent of men, and the levy is made by the *apo-ulmenes* and *ulmenes* without any difficulty, as no Araucanian ever refuses to come forward in defence of his country's liberty. Thus the army is formed with the greatest facility and promptitude. It consists generally of five or six thousand men, besides a large body of reserve.

The Araucanian army consists of cavalry and infantry: the former was not known among them before the arrival of the Spaniards; but they soon reared a fine breed of horses, and in 1568 they were able to equip some squadrons for the field. The *toqui* Cadeguala was the first who established

a regular body of cavalry in 1585. The infantry is formed into regiments, each consisting of 1000 men divided into ten companies; every regiment has a flag with a star embroidered upon it, which is the arms of the nation. The cavalry is divided in the same way, but the number of horsemen is not always the same. The soldiers wear no uniform, but they put on, under their usual dress, a cuirass made of leather hardened by means of a certain varnish. Their helmets and shields are also constructed of the same material. The cavalry are armed with lances and swords, and the infantry with pikes and clubs furnished with iron. Formerly they used the sling and the bow, but experience has taught them that close combat was more effectual against the fire-arms of the Spaniards. The Araucanians have never been able to discover the secret of manufacturing gunpowder. They were at first very anxious to possess it. Having observed some negroes among the Spaniards, they supposed that gunpowder, from its blackness, was extracted from their bodies. One of these poor negroes having had the misfortune to fall into their hands offered them the opportunity of trying the experiment. He was first flayed from head to foot, and then burnt to cinders, but the result only served to show them the fallacy of their chemical knowledge. They have occasionally made use of the guns which they have at different times taken from the Spaniards, but, perhaps from their strong prejudice against anything derived from the Europeans, they have never generally adopted them. The army, on its march, is always preceded by an advanced guard to prevent any surprise. The infantry is usually all mounted on horseback until they discover the enemy, when they immediately dismount and form themselves into companies. Each soldier carries with him his own provisions, consisting of some roasted meal or flour in a bag, a small quantity of which mixed with cold or warm water serves them for food until they arrive at the enemy's territory. In this manner their armies, unincumbered with any sort of baggage, move with great expedition. The precautions displayed in their encampments, particularly at night, is admirable. Having formed an entrenchment round the camp with ditches covered with branches of trees and brambles, they place their centinels around. Every soldier, to show his vigilance, is obliged to keep a fire all night before his tent.

After the battle, every soldier is the rightful master of the prize which he himself has made, but when the booty has been taken in common, it is divided equally among them all, the *toqui* himself having no greater share in it than the private soldier.

One of the laws of the military code of the Araucanians prescribes, that after the battle one of the prisoners must be sacrificed to the manes of the heroes who have fallen. The ceremony is called the *pruloncon* or dance of the dead. Fortunately this horrid custom is so rarely performed, that in the space of two hundred years, it is said, only two of these festivals occurred.

When the enemy sues for peace, a great congress is held generally in an extensive plain between the rivers Bio-Bio and Dunqueco, on the boundaries of Chili and Araucania. The Spanish president and the Araucanian *toqui*, accompanied by four deputies from the respective *uthalmapi*, without the unanimous consent of whom the peace cannot be ratified, repair thither. The two nations then encamp at the distance of two miles from each other. The conference is opened by many tedious compliments on each side, and in sign of reciprocal friendship, the staves of the *ulmenes* and that of the Spanish president are tied together, and placed in the middle of the assembly. An Araucanian orator then makes a long harangue in the Araucanian language, expatiating at great length on the evils of war and the advantages of peace: a similar one from the Spanish president is made in reply, which is translated word for word by an interpreter. The articles of the treaty are then signed and ratified by the sacrifice of several Chilichueque or Chilian llamas, with the blood of which the *toqui* sprinkles a branch of cinnamon, and presents it to the president as a token of friendship. A festival is then held, in which the Spanish president dines with the *toqui* and the *ulmenes*, and makes them a magnificent present in the name of his sovereign.

The religious system of the Araucanians is in accordance with their political system of government. They acknowledge a Supreme Being, whom they call *Pillan*, a word derived from *pulli*, 'the soul,' which means the essential soul or

spirit. They give him the epithets of *Guenu-Pillan*, or 'the Spirit of Heaven,' *Vuta-Gen*, 'Great Being,' *Vilvemvœ*, 'Creator of All,' &c. The universal government of their *Pillan* is similar to their own. He is the great toqui of the universe, and has his apo-ulmenes and ulmenes to preside over the inferior affairs. The principal of these inferior deities are, the *Epunamum*, or 'god of war,' and the *Meulen*, 'the beneficent god, the friend of the human kind.' There is also the *Guecubu*, or *Huecuvu* (for it is indifferent which initial letter is used), who is the author of evil. No misfortune happens to an Araucanian which is not attributed to this malignant being. If a horse is tired, the *Guecubu* has been riding on its back; if the earth quakes, it is because the *Guecubu* has shaken it; if a friend dies, he has been suffocated by the *Guecubu*. On the contrary, the good *Meulen*, by the agency of his celestial ulmenes, is constantly endeavouring to check his malignant influence. These spirits or genii are male and female; the former are called *Gen*, and the latter *Amei-Mulghen*, or spiritual nymphs, one of which latter is constantly attendant on every Araucanian; and so firmly are they persuaded of the truth of this influence, that when any one has been fortunate in anything, he expresses his satisfaction by saying, *Nien cai si Amchi-Mulghen*, that is, 'I have my nymph by me.' As their earthly rulers require no particular service of them, the Araucanians suppose that the Supreme Being also requires no sort of worship; accordingly, they have neither temples, idols, nor priests, and offer no sacrifices except on some solemn occasion, when they offer a llama, and burn tobacco, as the incense most grateful to their divinities. They are very superstitious: an Araucanian, who faces a cannon with intrepid valour, is terrified at the sight of an owl.

One of the chief articles of their religion is, the immortality of the soul. They acknowledge that man is formed of two substances, the *anca*, or body, and the *am* or *pulli*, soul, and that the latter is *ancanolu*, or incorporeal, and *mugealu*, immortal. After the death of the body, the soul is taken by a spirit to a place called *guelcheman*, or the abode of the men on the other side of the mountains, which place, according to some, is divided into two regions, one of bliss for the good, and another of misery for the wicked; but others pretend that they will all be there eternally happy, and that their actions during the life of the body have no influence on their future state.

As soon as an Araucanian dies, the body is laid upon the ground, and all the friends of the deceased sit round it uttering mournful lamentations for some time. It is then placed on a high bier, clad in the richest garments, and the night is passed in weeping, eating, and drinking. This funeral festival is called *curicahuin* or the black festival, that colour being with the colour of mourning. On the following day, and sometimes two or three days after death, the body is taken to the *eltun*, or burial-ground of the family, which is generally on some high hill or in a wood. Two young men on horseback, running at full speed, precede the funeral procession; these are followed by the bier, which is carried by the nearest relations of the deceased. A number of women accompany the procession, uttering lamentable cries, and another woman follows behind, strewing the road with ashes, which they imagine will prevent the soul returning to its earthly abode. When they arrive at the burial-ground, the body is placed in the grave, surrounded by his arms if a man, and by female implements if a woman, together with several dishes full of victuals, and some vessels full of *chicha*, or wine. Sometimes a horse is killed, and buried with the body. It is then covered with earth, and several stones piled up in the form of a pyramid. A great quantity of *chicha* is then poured upon it as a funeral libation, and the company return home.

In the new state of existence, the soul being free from the incumbrance of the body, pursues with greater facility and perfection all the occupations that it had in the body. Wives return to the bosom of their husbands, and children rejoice their parents, but no new children are born.

They also preserve the tradition of a universal deluge from which a few persons were saved on the top of a mountain having three points, called by them the *Thegtheg* or 'Thundering Mountain,' which floated upon the waters. As this deluge was preceded by an earthquake and a volcanic eruption, whenever these phenomena take place the inhabitants betake themselves to one of those mountains in the Andes which resembles the *Thegtheg*, carrying with them an abundant supply of provisions, and several wooden plates to

protect their heads against the excessive heat of the sun in case the mountain should be raised too near to that body.

The Araucanians divide their years into seasons, months, and days, as we do. Their year is solar, and begins on the 22d of December, or immediately after their summer solstice, which they call *thaumathipantu*, that is, 'the end and beginning of the year,' and the winter solstice they call *udanthipantu*, or 'divider of the year. These points they determine with some degree of accuracy by the solstitial shadows. Their *thipantu*, or year, is divided into twelve *cuyen*, or moons, of thirty days each, and five days are added, probably, to the last month. They name their months from some occurrence which takes place in each, as *Avun-cuyen*, 'month of the fruit,' which corresponds to our January; *Coji-cuyen*, February, or the 'harvest month,' &c. They divide the natural day into two equal parts, and these again they subdivide into twelve parts, six for the day and six for the night; thus their *uagantu*, or hour, is equal to two of ours. They measure their hours by the altitude of the sun in the day, and by the stars at night, without the aid of any instruments. In civil affairs they reckon their time by days, mornings, or nights. They divide the stars into *pal*, constellations, and distinguish them by the number of stars which every one consists of: thus, the pleiades they call *caju-pal*, or 'the constellation of six.' They also distinguish them from the planets, which they call *gau*, from the verb *gaun*, to wash, supposing that when they set they sink into the sea. They believe them to be inhabited, for which reason they call them countries, as *cuyen-mapu*, the country of the moon. Eclipses are not considered by these people as bad omens, but as simple natural phenomena, the cause of which they do not know. An eclipse of the sun they call *lay-antu*, and that of the moon *lay-cuyen*, that is, 'the death of the sun or moon.' Comets are considered by them as terrestrial exhalations which become ignited in the atmosphere, but they are not terrified by their appearance.

The only sciences which they cultivate are, oratory, poetry, and medicine. Of these sciences oratory is that which they hold in the highest esteem. The eldest son of an ulmen who is not a proficient in this art is excluded from the succession: for this reason they take their children to their national assemblies, and accustom them, at a very early period, to speak in public. Their poets are called *gempin*, 'or lords of speech.' Their poems, which are transmitted from father to son, generally have reference to the exploits of their heroes, and the measure most generally adopted in their compositions is that of eight or eleven syllables. They are so careful to preserve their language in all its purity, that when a foreigner settles among them he is obliged to change his name for an Araucanian one; even the missionaries have been compelled to adopt that practice, and to submit to be interrupted in their sermons by their auditory at every fault they make. Though many Araucanians know the Spanish language, they will rather submit, on all public occasions, to the tedious explanation of an interpreter than adopt the Spanish tongue.

The language, though not written by the Araucanians, is very copious. Molina says that, according to the vocabularies which are in existence, the best of which is far from perfect, its radical words, which are generally monosyllables or dissyllables, amount to 1773. These roots are susceptible of an indefinite number of combinations. Owing to the want of guttural and harsh sounds, and to the great variety in accentuating the words, it is very sweet and harmonious; its etymology is very simple and regular. There is not a single noun or verb irregular. One declension serves for all nouns, and the signs of the different cases are the same in the singular, dual, and plural: thus they say *chao-ni*, of the father; *chao-egu-ni*, of the two fathers; and *pu-chao-ni*, of the fathers. The genders are confined to words designating animate beings. The masculine is expressed by *huentu*, a male, and the feminine by *domo*, a female—e. g. *huentuthehua*, a dog, *domothehua*, a bitch. In the masculine the sign is generally omitted. The mechanism of the conjugation is also very simple. The terminations of the indicative present are *n*, *imi*, *i*, for the singular, *iu*, *imu*, *igu*, for the dual; and *ign*, *imen*, *igen*, for the plural, which terminations are the same in all tenses. The number of tenses in the indicative and subjunctive is, two for the present, three for the past, two for the future, and two aorists. The characteristic sign of every tense is placed between the radical and the termination. Thus from *clun*, I give, is formed *clu-a-n*, I will give, and *clu-bu-n*, I did give; the

passive is formed with *gen*, to be; e. g. *clu-gen*, I am given; *elu-ge-a-n*, I will be given. Substantives, adjectives, adverbs, and even interjections, are converted into verbs by adding an *n* to the word—e. g. *elu*, a gift, *elu-n*, to give; *cume*, good, *cume-n*, to be good; *ina*, close, *inan*, to be close by; *alulú*, ah! *alulún*, to feel a pain. Adjectives are converted into abstract substantives by adding *gen* to them—e. g. *cume*, good; *cumegen*, goodness. Intransitive verbs are changed into active by means of certain particles: thus from *in*, to eat, *ileln*, to cause one to eat. There is in this language a great latitude for stringing words together, and very often a single word expresses one or two sentences: thus the word *rucatunmaclopaen* means, 'pray come and help me to build a house;' which word is composed of *ruca*, a house; *tun*, build; *ma*, a sign of entreaty; *clo*, help; *paen*, come. The only books existing in this language are catechisms, sermons, prayers, and other religious books, translated or composed by the Jesuits, to whose labours we are also indebted for most of the grammars and dictionaries of this tongue.

The physicians are of three classes,—the *ampives*, or empirics, the *vileus*, or methodical, and the *machis*, who cure by spell; the first of these physicians employ principally simples in curing diseases, and are excellent practitioners; the *vileus* pretend that all contagious diseases proceed from insects. When all the efforts of the *ampives* and *vileus* have proved inefficient in curing a patient, a *machi* is sent for, who, after practising some mysterious ceremonies, pretends he has discovered the place where the magic poison lies, and reveals the name of the person supposed to have administered it, hereby very frequently endangering the life of some innocent individual. They have likewise two sorts of surgeons,—the *gutarve*, who cures fractures, dislocations, ulcers, &c.; and the *cupove*, or anatomizers, so called because they are principally employed in opening the bodies of such as die of unknown maladies. Besides the above-mentioned professions, they have mechanics, such as blacksmiths, silversmiths, carpenters, &c.

The Araucanians have as many wives as they can support, or rather are able to purchase; but, as in all other countries where polygamy is permitted, it is only the rich who enjoy this privilege: the poor content themselves with one or two. Celibacy is disgraceful among them. An old bachelor is called *vuchiapra*, which means a useless old man; and *cudepra*, a useless old woman, is the word by which they designate an old maid. The marriage ceremony is very simple, and consists in carrying off the bride by pretended violence. When the bridegroom has fixed with his future father-in-law the sum that he is to give him for his daughter, he goes, accompanied by some of his friends, to surprise the bride in some retired spot; she is then seized, placed upon the horse of her future husband, and conducted to the house of the bridegroom, where the nuptial festival is celebrated. The first wife, called *unendomo*, is always considered the legitimate one, and respected as such by all the *inandomo*, or secondary wives. Each wife is obliged to present her husband every day with a particular dish cooked by herself at her own fire. Thus the most civil manner of asking an Araucanian how many wives he has is, *mivu cuthalgeimi*? or, 'how many fires have you?' It is, besides, the duty of every wife to furnish her husband with the necessary articles of dress, and with one *poncho* every year. The Araucanian women are noted for the cleanliness not only of their houses and clothes, but even of their persons. They comb their hair twice a day, and wash their head at least once a week with the bark of the *quillay*, or *quillaja saponaria*, which they make use of instead of soap. Their habitations are placed near the banks of rivers, in which, during summer, the men bathe several times a-day, and in winter at least once a-day. The women also bathe regularly, and on the very day of giving birth to a child they wash both the infant and themselves in the stream, and then lay it upon a sort of rush cradle, which is hung on the ceiling, covered with soft skins, and return to their daily occupations. The child is generally unclothed until it begins to walk, when they put on it a very loose gown. Their moral education is not more constrained than their physical. Their parents instruct the males in the management of arms, and in speaking their language with freedom, elegance, and purity, allowing them to do everything without restraint; they very seldom inflict on them any corporal punishment, as in their opinion this practice tends to degrade them and make them cowards.

The Araucanians are of a moderate stature, strong, muscular, and well-built, and naturally have a very martial air. It is exceedingly rare to find among them a deformed person; not because, as some have erroneously supposed, they destroy the infants who are born with any imperfection, but because the modes of life and other obstacles, which among civilized nations prevent the action of nature, are unknown among them. Their colour, like the rest of the Americans, is that of copper, although somewhat lighter; their face is oval, their eyes small, but lively and full of expression, the nose rather flat, the mouth pleasing, with fine regular teeth; the legs well formed and muscular, with small and flat feet. In general, they have no beard, because they take particular care to eradicate every hair that grows on any part of the body except the head, the hair of which they never cut, but dress it round in tresses. Old age is seldom perceptible in the Araucanians before their sixtieth year, and it is not a rare occurrence to see an Araucanian eighty years of age without a single grey hair. Frequently they attain the age of ninety or a hundred years. Their moral qualities correspond to the physical. They are bold, intrepid, courageous, constant in enduring the fatigues of war, and fearlessly expose their lives when the liberty of their country is at stake. They are also exceedingly jealous of their honour; hospitable, honest, grateful, generous, and humane to the enemies they have conquered; but they are indolent when not at war, addicted to intoxication, presumptuous, and haughty.

The dress of the men consists of a shirt, a sort of jacket, with small tight breeches, and a *poncho*, which is a piece of cloth simply with a hole in the middle for the head to pass through, falling before and behind down to the knees, and open at the sides like a cassock. The colour of their dress is generally blue, which is their favourite colour. On their heads they wear a sort of band like a diadem, which in time of war is ornamented with feathers; they also wear a sash of different colours round the waist. Persons of distinction make use of woollen boots of different colours and leathern sandals, which they call *chelle*; but the people go bare-footed.

The dress of the women is very simple and modest, consisting of a long tunic or gown without sleeves, called *chiamal*, fastened to the shoulders with silver buttons; a sash round the waist; and a short mantle called *ichella*. This dress is never altered, but they are allowed to add to it all the ornaments which their fancy or vanity may prompt them. The colour of their dress is also blue. The hair is divided into several tresses, which they allow to fall down their shoulders; their head is adorned with false emeralds, called *lianca*, to which they attach a high value. They also wear necklaces and bracelets of glass beads, and a sort of square ear-rings made of silver. Even the poorest of the Araucanian women has upon every finger a ring of the same metal.

The Araucanians build their habitations along the banks of rivers, or in plains where there is a facility for irrigation, and every family is anxious to occupy that piece of land which they inherited from their ancestors. They never build large towns, and much less walled cities, which they consider as marks of servitude.

The games of skill with which they amuse themselves are *comican* or chess, and the *quechu*, similar to back gammon, both of which they knew previous to the arrival of the Spaniards. Gymnastic exercises they practise most passionately; besides wrestling and racing, they have a peculiar game called the *peuco*, representing a siege. Twelve young men form themselves into a ring, holding each other by the hands; in the middle a child is placed; an equal number of assailants attack the ring, and endeavour to carry off the child.

Since the first invasion in 1537, the Araucanians have sustained an almost uninterrupted war against the Spaniards for nearly three hundred years. Valdivia, one of the first who undertook the conquest of Chili, founded on the Araucanian territory the settlements of Imperial, Villarica, Valdivia, and Angol, all which were almost entirely destroyed by the toqui Pailamachu in 1602. The siege of Villarica lasted two years and eleven months. The pious Father Valdivia, a Jesuit who had been a missionary among the Araucanians, convinced the Spanish government of the necessity and advantage of being at peace with them, and the negotiations were in a state of forwardness when the unfortunate circumstance occurred of a Spanish lady, who was the slave of the toqui Ancanamon, making her escape, and

carrying with her two of his little children, and four of his wives and daughters, whom she had persuaded to embrace the Catholic religion. The Spanish governor naturally took the lady and her converts under his protection. The toqui, in high indignation at the loss he had sustained, listened to no further proposals, and the war was again renewed with fresh vigour. In 1641 the governor, Marques de Baydes, at last entered into a treaty of peace with the toqui Linco-pichion. In 1655 war raged once more from causes which are not known; and it lasted until 1773, when Spain was forced to acknowledge the Araucanians as an independent nation, and to allow them to send an ambassador, who should reside at Santiago de Chili. During the time of the presidency of Don Ambrosio O'Higgins this people continued to enjoy the blessings of peace; and we are informed by Vancouver, that this enlightened and humane governor had in some measure succeeded in introducing among them a spirit of industry, and that he had the pleasure to see them endeavouring to excel each other in the cultivation of the ground, the breeding of cattle, and other peaceful arts. In the late contest between the colonies and the mother country the Araucanian toqui promised to observe a strict neutrality, and was faithful to his promise. Schmidtmeyer, who visited Chili in 1820, says, that in the independent army of that country some Araucanian youths of the first rank served as officers, and that, according to the opinion of the creoles, they fought like Mars, and drank like Bacchus; 'two characteristic national features,' adds he, 'which still appear strongly marked in that people.' The exploits of this warlike nation have been celebrated by their enemies. Six different poems are still in existence: the best of those that we are acquainted with is the *Araucana*, by Alonso de Ercilla [see Ercilla], who was himself engaged in the wars which he describes in his poem. (See Molina's *History of Chili*, written in Italian, and translated into Spanish by Mendoza, Madrid, 1788, 2 vols. At the end of the second volume is a list of more than sixty writers and works on matters relating to Chili. *Compendio della Storia naturale e civile del Regno di Chile*, Bologna, Anonymous. Vancouver's *Voyage of Discovery to the North Pacific Ocean*, vol. iii., chap. 5. Schmidtmeyer's *Travels into Chili over the Andes in 1820-21*, chap. xv. Febres's *Arte de la Lengua General del Reino de Chile*.)

ARAUCARIA, in Botany, is the name of a singular genus of gigantic firs, found scattered over the southern hemisphere. It is known from all the other firs by its stiff broad leaves; by a long leafy appendage with which the scales of its cones are terminated, and by its anthers having many cells. Only three certain species have been described, of each of which we shall give some account.

Araucaria excelsa, commonly called the Norfolk Island Pine, is found not only in the spot after which it has been named, but also in several other places in the South Seas, as in New Caledonia, Botany Island, Isle of Pines, and in some parts of the east coast of New Holland. It is described as a most majestic tree, growing to the height of from 160 to 228 feet, with a circumference sometimes of more than 30 feet. Its trunk rises erect, and is sparingly covered with long, drooping, naked branches, towards the extremities of which the leaves are clustered; these latter, when the plant is young, are long, narrow, curved, sharp-pointed, and spreading, but when the tree is old they have a shorter and broader figure, and are pressed close to the branches; old and young trees are consequently so different that one would think them distinct species. The bark abounds in turpentine; the wood, which is destitute of that substance, is white, tough, and close-grained. It was once expected that this tree would have been valuable for its timber, and that it would have afforded spars for the navy of great size; but it has been found on trial to be too heavy, and so unsound, that Captain Hunter could only find seven trees fit for use out of thirty-four that he caused to be felled. Its wood is, however, useful for carpenters' indoor work. Several specimens of this tree exist in the collections of this country. Unfortunately it will not live in the open air in the winter, and its growth is so rapid as to render it very soon too large for the loftiest greenhouses. A supposed species, called the Moreton Bay Pine, or *Araucaria Cunninghamii*, is scarcely distinguishable from this. It is a highly interesting fact, that a plant very nearly the same as this *araucaria excelsa* certainly once grew in Great Britain. Remains of it have been found in the lias of Dorsetshire, and have been figured in the Fossil Flora, under the name of *Araucaria primæva*.

[*Araucaria excelsa*.]

Araucaria Dombeyi, or, as it is more commonly called, *A. imbricata*, is a noble species, inhabiting the mountains of the Araucanian Indians in South America, whence the name of the genus derives its origin. This species has its branches closely covered with broad, lance-shaped, very rigid and pungent dark-green leaves; it produces its branches in circles around its erect stem; and when old it acquires an appearance not very unlike that of the Norfolk Island pine, only it is much less graceful. Its wood is said to be durable, and it yields a great quantity of resin. It is expected to be naturalised in this country, as some individuals now exist as far north as London, which have survived several winters with but little protection. It is, however, not a native of so low a latitude as is commonly supposed, and does not exist on the mountains farther to the southward than the volcano of Villarica.

Araucaria Brasiliensis is extremely like the last, but the leaves are longer, weaker, and less densely imbricated; and it is much more impatient of cold. It is found wild in the southern provinces of Brazil.

All these species are multiplied with difficulty, unless by their seeds; and the latter are so seldom brought to England in a living state, as to render all the species still extremely rare. Travellers may, however, bring them home in safety, by packing them in earth rammed hard into boxes, and kept dry and in the dark, and exposed to as little variation of temperature as possible.

ARAVULLI is a mountain-range, which forms one of the most remarkable features of northern India. Its southern extremity may be placed where the 24th parallel is cut by the 73rd meridian, to the north of Edur, or Eder. From this point it extends in a N.N.E. direction to 28° N. lat., where it terminates some minutes to the east of 76° E. long. Its whole length, therefore, may amount to upwards of 300 miles. Its breadth is various: from the southern extremity to the fortress of Komulmair it extends about sixty miles from west to east, and is composed of numerous high ridges generally running south-west and north-east. To the north of Komulmair it forms one uninterrupted and compact range of table-land, from six to twenty miles in width. Thus it continues up to the town and valley of Ajmeer where it

begins to lose its tabular form, and, breaking into lofty ridges, sends numerous branches through the territories of the rajah of Tejpoor and Alwar, which terminate to the south of Kanound and Rewaree.

This mountain-chain is not remarkable for its height. On an average it does not rise to more than 3000 feet above the level of the sea, though, perhaps, some summits may attain a thousand more; but the extreme steepness of its declivity to the west renders it impossible for the boldest invader to attack India on this side. Here it is skirted by an extensive plain, the Indian desert, called by the inhabitants Maroost' hali (the region of death), a country which rather resembles the high plains of Persia than the Sahara of Africa. A general might conduct an army to the foot of the Aravulli, but he would find it impossible to march over this chain, across which no carriage road can be made, at least none that is practicable for artillery. Thus every invader of India is obliged to enter that country by the plain which extends from the north-eastern extremity of the Aravulli, and of the Maroost' hali, to the Himalaya mountains; and India, in a military point of view, may be considered as an island, joined to the continent by an isthmus of about 100 miles in length, and perhaps less in breadth. This circumstance must render the means of defence of that rich country easy and effective in the hands of an active and well-constituted government.

The southern extremity of the Aravulli range is united to the Vindhya mountains by an extremely hilly and broken country, extending from Edur to Lunawarra, on the river Myhie, occupying all the country on the upper part of that river and its branches, and joining the Vindhya mountains near Champanair. By the same hilly country it is united to the table-land Pat'har, from which the principal range is only separated by the valley of Oodipoor.

That part of the Aravulli mountains lying to the south of Komulmar is in possession of a number of communities, composed of aboriginal races, living in a state of almost savage independence, owning no paramount power, paying no tribute, and preserving all the simplicity of small republics, though their leaders, having the title of Rawut, are hereditary. The rawut of Oguna can bring into the field 5000 bows. Their habitations are dispersed through the valleys in small rude hamlets, near their pastures or places of defence. To the north of Komulmar the range is inhabited by a mountain-race called *Mair*, who formerly, when the surrounding countries were in a state of war approaching to anarchy, issued from their fastnesses, infested their neighbours, and robbed them of their most valuable property; but since the East India Company has become the protector of Rajast'han, they have been peaceable subjects. They possess upwards of 150 villages and hamlets, scattered over the rocks and valleys, which are abundantly watered, and not deficient in pasture. The produce of the cultivated ground, though of comparatively small extent, is commonly sufficient for the wants of the inhabitants; but it is raised with infinite labour on terraces, as in Switzerland and the Tyrol. This is effected by constructing, on the narrow level tract along the rivers and upon the shelving sides of the mountains and hills, a series of terraces rising over each other, and by forming above the terraces pools or reservoirs, by means of large trees, from which pools the water is conducted so as to irrigate successively the terraces, on which rich crops of sugar-cane, cotton, rice, and Indian corn are raised.

The rills which rise in the short valleys of this range are numerous, and by their union form some rivers. Those descending from the eastern declivity fall into the Bunas, a tributary of the Chumbul; and those running to the west join the Loony, or Salt River, which enters the Rin.

This range is composed of rocks of primitive formation. 'The granite reposes,' as Colonel Tod reports, 'in a variety of angles (the general dip is to the east) on massive compact dark blue slate, the latter rarely appearing much above the surface or base of the superincumbent granite. The internal valleys abound in variegated quartz and a variety of schistus slate of every hue, which gives a most singular appearance to the houses and temples when the sun shines upon them. Rocks of gneiss and of syenite appear in the intervals; and in the diverging ridges west of Ajmeer the summits are quite dazzling with the enormous masses of vitreous rose-coloured quartz.' Tin, which also yielded much silver, was once worked; copper, of a very fine description, is still extracted in sufficient quantity to supply the currency of

Rajast'han. Garnet, amethystine quartz, rock crystal, chrysolite, and some inferior kinds of emerald, are found in a few places.

The name Aravulli implies 'the strength of refuge,' which is very appropriate, as at all times it has afforded protection to the ancient sovereigns who held dominion either to the east or to the west of it. (Tod's *Annals and History of Rajast'han*; *Maps* by the Society for the Diffusion of Useful Knowledge, *India*, VI. and IX.)

ARBE, one of the Quarnaro islands, in the gulf of Quarnaro, on the coast of Dalmatia, and within the circle of Zara in that province, from which it is separated by the canal of Morlaacca. It is twenty-nine miles in superficial extent, and is very mountainous; it contains four valleys, which have a very productive soil. The climate of this island, when northerly winds are prevalent, is at times so inclement, that thousands of sheep have frequently been frozen to death in one season. It produces wine, olives, figs, and corn; these, together with its fishery, salt-pans, and numerous flocks, afford lucrative occupation to its inhabitants. The latter are above 3000 in number, and dwell in the town and a market-village, or live dispersed in separate tenements: they profess the Roman Catholic faith. There are six monastic establishments and sixty ecclesiastics on the island. The town is *Arbe*, in the bay of Campora, with a good harbour it is the seat of a bishopric, and contains about 900 inhabitants. The name of the market village is *Barbado*. Lat. 44° 50' N., long. 14° 50' E. (according to the twelfth edition of Stein's *Atlas*).

ARBE'LA, now Arbîl or Erbîl, a miserable village, which lies on the ordinary route from Bagdad to Mosul, in 36° 11' N. lat., according to Niebuhr's observations. It is situated between the Little and Great Zab (the Lycus), but nearer the latter, in a hilly and tolerably fertile district. Arbela was once in possession of an hereditary race of Mohammedan princes, whose dominion extended to Tabreez in Azerdibjan, and it was then a large city, defended by a castle situated on a hill of a conical shape. Niebuhr describes the castle as existing when he passed through, though its outer wall was gone: Kinneir remarks, that the castle probably stood on the hill, from which it would be a fair inference, but perhaps not a true one, that the castle is no longer there. Part of the town, which consists of wretched houses built of sun-dried bricks, is on the hill, and part around it. There are no antiquities here, but there is a minâreh belonging to a mosque at a little distance, which was erected by Sultan Musaffer. This minâreh is strongly built of burnt bricks and mortar, and has two entrances facing one another, each leading to a flight of steps, by which two persons may ascend the tower without seeing one another till they meet on the top.

Arbela is best known for having given name to the last great battle between Alexander and Darius, B.C. 331. The battle was not fought at Arbela, but at a spot called Gaugamela, now Karmelis, a little place about 36 miles (Niebuhr) W. by N. from Arbela (but 600 stadia according to Arrian), on a small stream called the Chaser, the Bu'madus or Bumelus of Arrian. (*Anab.* iii. 8.) After the battle, Alexander, in his pursuit of Darius, crossed the Lycus, and arrived at Arbela. [See ALEXANDER; Niebuhr's *Travels*, vol. ii. p. 342, Copenhagen edition; Kinneir's *Memoir of Persia*.]

ARBITER, was a term in the Roman law signifying a judge invested with a discretionary power, and was applied to different kinds of judicial functionaries. The *arbitrator compromissarius* answered to the arbitrator of modern jurisprudence, and his office will be treated of under the article ARBITRATION.

Another species of arbiter, peculiar to the law of Rome, partook more nearly of the character of an ordinary judge. In order to understand the nature of his office, it must be borne in mind, that all actions were commenced before the prætor, and the preliminary proceedings carried on before him; and when the altercations of the parties formally expressed had raised a question of fact disputed between them, a person was appointed to whom the adjudication of this fact was referred: the title and powers of this person depended on the nature of the action. The different kinds of actions known to the Roman law were divided into three classes: actions of strict law, actions of good faith, and arbitrary actions: under the first class were comprehended all actions upon contracts called unilateral, that is, where only one of the parties is bound, as in the case of money borrowed, where the borrower is bound to repay, but no further obligation lies

upon the lender. In these actions the person appointed to adjudicate was styled a judge (*judez*), and the only question for him to decide was, simply whether the plaintiff had completely established his case as originally stated.

In the two other classes of actions the person appointed to adjudicate was allowed a greater latitude of judgment, and was styled an arbiter. Actions of good faith were such as were founded on bilateral contracts, that is, on contracts by which an obligation is imposed on both parties, such as the contract of sale, where the seller is bound to deliver the goods, and the purchaser to pay the price. In all these actions the arbiter was not compelled, as in actions of strict law, either to grant or to reject altogether the claim of the plaintiff, but might enter into the merits of the case, and decide according to what seemed to him to be just and equitable between the parties.

To the third class, viz., that of arbitrary actions, belonged those chiefly in which the restitution of property, or some specific performance, was required of the defendant. In these cases the arbiter had authority to estimate the just claims of the plaintiff, and to condemn the defendant to some greater penalty, as for instance to pay fourfold in case of his not performing the judgment. (Just. *Institut.* lib. iv. tit. 6; Heineccii, *Elem. Jur. Civ.* § 1181, § 1196; Idem, *Antiq. Rom.* iv. 6, 36.)

ARBITRATION is the adjudication upon a matter in controversy by private individuals selected and appointed by the parties. This mode of settling differences is very frequently resorted to as a species of amicable litigation, and a means of avoiding the delay and expense of a lawsuit, and the publicity of a trial. It has the further advantage of providing an efficient tribunal for the decision of many causes—such, for instance, as involve the examination of long and complicated accounts,—which our ordinary courts of law are, from their mode of proceeding and the want of proper machinery, incompetent to investigate.

The person appointed to adjudicate is called an arbitrator, or referee. The matter on which he is appointed to adjudicate is said to be referred or submitted to arbitration. His judgment or decision is called an arbitrament, or, more usually, an award.

Any matter actually in controversy between private persons may be referred to arbitration; but a prospective agreement to refer any differences which may hereafter arise is not binding. Nor can any injury be the subject of an arbitration, unless it is such as may be a matter of civil controversy between the parties: a felony, for instance, which is a wrong, not to the party injured merely, but to society in general, is incapable of being referred.

There are no particular qualifications required for an arbitrator. In matters of complicated accounts, mercantile men are usually preferred. In other cases, it is generally considered advisable to appoint barristers, who, being accustomed to judicial investigations, are able to estimate the evidence properly, to confine the examination strictly to the points in question, and, in the making of the award, to avoid those informalities for which it might afterwards be set aside. Both time and expense are thus saved by fixing on a professional arbitrator. Any number of persons may be named as arbitrators: if the number is even, it is usually provided that, if they are divided in opinion, a third person shall be appointed, called an umpire, to whose sole decision the matter is then referred. [See UMPIRE.]

A dispute may be referred to arbitration, either—1. When there is an action already pending between the parties relating thereto, or—2. When there is no such action.

1. In the former case, the parties to the action, if *sui juris*, are in general competent to submit to arbitration. The reference may be made at any stage of the proceedings: if before trial, it is effected by a rule of the court, either of law or equity, in which the action is brought; if at the trial, by an order of the judge or an order of *Nisi Prius*, either of which may afterwards be made a rule of court. The usual mode of proceeding is for the parties to consent that a verdict shall be given for the plaintiff for the damages laid in the declaration, subject to the award of the arbitrator.

The person named as arbitrator is not bound to accept the office, nor, having accepted, can he be compelled to proceed with it. In either case, if the arbitrator refuses or ceases to act, the reference is at an end, unless the contingency has been provided for in the submission, or unless both parties consent to appoint some other person as arbitrator in his stead.

Previously to the late statute for the amendment of the law, 3 and 4 Will. IV. c. 42, the authority of the arbitrator was revocable by either party at any time before the award was made; but by that statute it is declared that the authority of an arbitrator cannot be revoked by any of the parties without the leave of the court or a judge: but it is still determined by the death of any of the parties, unless a clause to obviate this is inserted in the submission; and if one of the parties is a single woman, her marriage, being in law a civil death of all her rights, will have the same effect. The order of reference usually provides that the award shall be made within a certain period; and if the arbitrator lets the day slip without making his award, his authority ceases, but a clause has usually been inserted to enable the arbitrator to enlarge the term; and now, independently of any such clause, the court, or any judge thereof, is, by the late statute for the amendment of the law, empowered to do so. The authority of an arbitrator likewise ceases as soon as he has made or declared his award. After this (even though it be before the expiration of the time appointed) he has no longer the power even of correcting a mistake.

When the arbitrator has accepted his office, he fixes the time and place for the parties to appear before him. Each of them furnishes him with a statement of his case, which is usually done by giving him a copy of the briefs on each side; and on the day appointed he proceeds to hear them (either in person, or by their counsel or attorneys), and to receive the evidence on each side, nearly in the same manner as a judge does at an ordinary trial: but he is frequently invested by the order of reference with a power, which courts of law in no case possess, of examining the parties themselves.

No means existed of compelling the attendance of witnesses, or the production of documents, before an arbitrator, until the statute 3 and 4 Will. IV. c. 42, authorized the court or a judge to make an order to that effect; disobedience to which order, if served with proper notice of the time and place of attendance, becomes a contempt of court. The witnesses, thus compelled to attend, are entitled to their expenses in the same manner as at a trial. And where the order requires the witnesses to be examined upon oath, the arbitrator is by the same statute authorized to administer an oath or affirmation, as the case may require; and any person giving false evidence may be indicted for perjury.

The extent of an arbitrator's authority depends on the terms of the reference: it may either be confined to the action pending between the parties, or it may include any other specified grounds of dispute, or all disputes and controversies whatever existing between them at the time of the reference. Where the matters referred to him are specified, it is his duty to decide upon them all: where they are not specified, it is his duty to decide upon as many as are laid before him. In no case is an arbitrator authorized to adjudicate upon anything not in fact comprehended in the reference; such, for instance, as any claims or disputes which may have arisen after the reference was made, or, where the reference is specific, anything not expressly included in it. As nothing can be referred by the parties but the differences existing between themselves, an arbitrator can have no authority to bind any one who is not a party to the reference.

An arbitrator being a judge appointed by the parties themselves for the final settlement of their differences, his decision on the merits of the case submitted to him is conclusive; the question is set at rest, and never can be agitated between them again. But if his award be partially or illegally made, the superior courts have the power of setting it aside, upon application being made within reasonable time. This happens either, 1. where the award is not co-extensive with the arbitrator's authority; or, 2. where it appears on the face of it to proceed on mistaken views of law, or to fail in some of the qualities required for its validity [see AWARD]; or, 3. where any misconduct has been committed. This may happen in two cases: 1st, where the arbitrators have been guilty of corruption or other misbehaviour, as, if they have proceeded to arbitrate without giving notice of the meeting, have improperly refused to receive evidence, or committed any other gross irregularity in practice: 2dly, where it is proved that the arbitrator has been misled by fraud used by either of the parties. Where an award is absolutely void, as where it is made after the authority of the arbitrator has ceased, it is not in general necessary to set it aside, as it is incapable of being enforced.

When the award has been made and delivered, if one of the parties refuses to comply with it, the other may bring an action against him on the award. But the most prompt and efficient remedy is to apply to the court for an attachment, grounded on the contempt of court which he has been guilty of by disobeying the order of reference. [See ATTACHMENT, CONTEMPT.] In opposing this application, the other party may insist on any objection apparent on the award itself; but if there were any other objections affecting its validity, and he has neglected to apply to the court to set it aside within the time fixed by them for that purpose, it is too late for him to avail himself of them.

When, in the original action, a verdict has been given for the plaintiff subject to a reference, if the defendant does not abide by and perform the award, the plaintiff may, by leave of the court, enter a judgment and sue out execution for the whole damages mentioned in the verdict.

2. Where no action has been commenced, the parties may refer their differences to arbitration by mutual agreement. Every person capable of making a disposition of his property may be party to such an agreement: no peculiar form is necessary for its validity.

Whether the submission be verbal or in writing, it is in the power of either of the parties to revoke it, and thus put an end to the authority of the arbitrator at any time before the award is made. In order to prevent this, it is usual for the parties to make it a part of their agreement, that they will abide by and perform the award; and if after this either of them should, without sufficient reason, revoke his submission, or otherwise prevent the arbitrator from proceeding with the arbitration, he will be liable to an action for the breach of his agreement.

The time for making the award may be enlarged, if there be a clause to that effect in the agreement of submission, or if all the parties consent to it, but not otherwise. There are no means of compelling the attendance of witnesses, nor has the arbitrator the power of administering an oath; but the witnesses and—if they have agreed to be examined—the parties are sworn either before a judge, or, in the country, before a commissioner. They may, however, be examined without having been sworn, if no objection is made to it at the time.

The courts cannot enforce performance of the award by attachment; the only remedy is an action on the award itself, or rather on the agreement of submission. The defendant may insist on any objection apparent on the award itself, but where there is any other ground for setting it aside, his only remedy is by a bill in equity.

Thus it will be seen that where the reference is by agreement, many inconveniences occur, particularly from the deficiency of the remedies; but the legislature has enabled parties to put such references on the same footing as those which are made where a cause is depending, by enacting, by 9 & 10 Will. III. c. 15, that they may agree that their submission (which it is held in this case must be in writing) shall be made a rule of any of his Majesty's courts of record, (and in practice courts of equity have long enjoyed concurrent jurisdiction), and insert such agreement in their submission; and this submission may at any time afterwards be made a rule of court, by producing the affidavit of its execution made by a witness thereto. The provisions of the new statute 3 & 4 Will. IV. c. 41, apply as well to arbitrations made in pursuance of such agreements of submission, as to those made by order of court; and the law is the same in both cases, except in some few points of practice.

The settlement of disputes by arbitration seems to have enjoyed in all ages a high degree of public favour. Aristotle, to give an instance of a metaphor that is appropriate without being obvious, quotes a passage from Archytas, in which he compares an arbitrator to an altar, as being a refuge for the injured. (Arist. *Rhetor.* lib. iii. ch. 2.) There were at Athens two modes of proceeding which passed by the name of arbitration—the Greek word for which is *diata* (*diara*). In one of these the arbitrators appear to have constituted what in modern jurisprudence would be called a Court of Reconciliation. A certain number of persons, of a specified age, were annually chosen from each tribe, as official referees; and from among these the arbitrators to decide upon each particular case were afterwards also chosen (*Petit. Leges Atticæ*, p. 345; *Heraldi Animadversiones*, p. 370), and were then bound to act, under pain of infamy. They sat in a public court, and their judgments were subscribed by the archons. (*Petit.*

p. 346.) An appeal lay from their decision to the ordinary courts; and sometimes the arbitrator referred the cause to their judgment at once, without pronouncing any sentence of his own. (*Heraldi Animadversiones*, p. 372.) In either case, all the writings connected with the trial were sealed up and delivered to the court before which the cause was brought. And it is said that originally no action could be introduced into the ordinary courts without having been first carried before the Court of Arbitrators. (*Petit.* p. 345; Pollux, viii. 10.) Their jurisdiction, however, was confined to Athenian citizens, and they took no cognizance of suits in which the sum in dispute was less than ten drachmæ, such smaller actions being disposed of in a summary manner by a special tribunal. (*Ibid.*) The litigant parties paid the expenses of the arbitration. (Boeckh, *Public Econ. of Athens*, i. 316, *English Trans.*) When their year of office expired, the arbitrators were liable to be called on for an account of their conduct, and if found guilty of corruption or misconduct, were punished with infamy.

In the other mode of proceeding, which was strictly in accordance with the definition which we have given of arbitration, the parties were at liberty to refer their differences to whomsoever they chose. The submission was generally made by a written agreement, which frequently contained an engagement by third persons to become sureties for its performance. (Demosthenes's *Speech against Apaturius*, chap. 4.) The arbitrator was not required to adhere to a rigid interpretation of the law, but might decide according to the individual merits of the case before him. (Aristot. *Rhet.* i. 14.) There lay no appeal from his award to any other tribunal whatever. (See the law quoted by Demosthenes against Meidias, chap. 26.)

The Roman law upon this subject is much better understood, and is of infinitely greater importance. Its influence has extended over the whole of Europe, and even in our own country it is evident that references made by virtue of a mutual agreement—apparently the first species of arbitration known in our law—are mainly founded upon the doctrines contained in the *Digests* of Justinian, lib. iv. tit. 8. The only mode of referring a matter to arbitration in the Roman law, was by an agreement called *compromissum*, which contained the names of the arbitrators (hence called *arbitri compromissarii*), the matters intended to be referred, and an undertaking by both parties to abide by the award, or in default thereof to pay to the other a certain sum of money as a penalty. The rule which forbids matters of public interest to be submitted to the judgment of a private referee, was not confined in its operation to criminal prosecutions and penal actions only, but extended to preclude arbitrators as well from entertaining any question affecting the civil condition (*status*) of any individual,—his freedom, for instance,—as from deciding on the validity of any contract which it was attempted to set aside on the ground of its having been obtained by fraud or force, &c.

The persons named as arbitrators were not bound to undertake the office, but having once done so, they might, by an application to the prætor, be compelled to go through with it. Their authority was, however, terminated by the death of either of the parties, unless his heirs were included in the submission; by the expiration of the time limited for the decision; by either party having broken the agreement, and so incurred the penalty; or by his becoming insolvent, and his property in consequence of a *cessio bonorum* being vested in his creditors. Their authority also ceased by what we should call an implied revocation, if the subject matter of the reference perished, or if the parties settled the dispute in some other way, referred it to other arbitrators, or proceeded with an action respecting it. Besides the cases in which his authority was thus at an end, an arbitrator could not be compelled to proceed with the reference if he could allege any sufficient excuse, as, for instance, that the submission was void, that there had arisen a deadly enmity between him and one of the parties, or that he had been prevented by ill-health, or by an appointment to some public office in the state.

The extent of the arbitrator's authority depended upon the terms of the submission, which might be either special or general. The submission usually appointed a certain day for the making of the award, but power was generally given to the arbitrators to enlarge the time if necessary, but they could not give their award on an earlier day without the consent of the parties. On the day originally appointed

or on that subsequently fixed by the arbitrators, they formally pronounced their award, and (unless it had been agreed otherwise) the parties were required to be present, and if one of them failed to appear, the award was not binding, but the party who had thus prevented the arbitration being completed incurred the penalty specified in the submission. If there were several arbitrators, all were bound to attend: they were not, however, required to be unanimous, but the opinion of the majority prevailed; and if they were equally divided, it is said that they might of their own authority appoint an umpire, and in case of their refusing, the prætor had the power of compelling them to do so. When their award was pronounced, their authority expired, and they could neither retract nor alter their decision.

The award when made had not the authority of the sentence of a court of justice, nor was there any direct method of enforcing the performance of it; but as the parties had bound themselves to abide by the arbitrator's decision, if either of them refused to perform it, or in any other way committed a breach of his engagement, he was liable to an action; and however unsatisfactory the award might appear, there was no appeal to any other court. If, indeed, the arbitrators had been guilty of corruption, fraud, or misconduct, or if they had not adhered to their authority, their award was not binding: there was, however, no direct method of setting it aside; but if an action was brought to enforce the award, such misconduct might be insisted on as an answer to it. (Heineccii *Elem. Jur. Civ.* part i. § 531-543; Voetii *Commentarius ad Pandect.* vol. i. pp. 290-300.)

The Roman law was, with some slight modifications, adopted in France (Domat's *Civil Law*, part i. book i. tit. 14; and *Public Law*, book ii. tit. 7; Pothier, *Traité de Procédure Civile*, part ii. chap. iv. art. 2), and notwithstanding the changes which have been introduced from time to time, it still forms the groundwork of the system. There are at present three kinds of arbitration; the first is voluntary arbitration, which is founded, as in the Roman law, upon an agreement of the parties. The mode of proceeding in this case is treated of at considerable length, and with minute attention to details, in the *Code de Procédure Civile*, art. 1003-1028.

The ordinary courts exercise a much greater control over the proceedings in references than they do in England, but they have never had the power which the magistrates had at Rome—of compelling a person who had once undertaken the office of arbitrator to proceed with it; nevertheless, if he fail to do so, without a sufficient excuse, he is liable to an action for the damages occasioned by his neglect of duty. In order to understand clearly the peculiarities of the French system, it will be necessary to bear in mind that the proceedings before the arbitrators are much more nearly on the same footing with the regular administration of justice than is the case with us, and that many of the details are merely adopted from the practice of the ordinary courts: for instance, there is a system of local judicature established in France, and as the judge is resident in the neighbourhood of the suitors, it has been found necessary—in order to guard against partiality or the suspicion of partiality—to allow either party to refuse or challenge a judge, as in England they would challenge a jurymen; and in the same manner an arbitrator may be challenged, but this can only be in respect of some objection which has arisen since his appointment, for the very act of appointing him is an implied waiver of any objections which might have existed up to that time; but if there is no ground for challenge, the arbitrator's authority cannot be revoked without the consent of both parties.

An arbitrator's decision or award is considered as a judgment, and all the formalities required for the validity of a judgment must therefore be observed; but execution of it cannot be enforced until it has received the sanction of the public authority: this sanction is conferred by a warrant of execution granted by the president of the tribunal within the jurisdiction of which the cause of the action arose: the granting of this warrant is called the homologation of the award. If the arbitrator has not strictly pursued his authority, the warrant of execution may be superseded, and the award declared null by an application to the tribunal from which the warrant issued. Besides this, the same modes of obtaining relief may be resorted to in the case of an award, as in that of any other judgment. If any mis-

conduct or irregularity has occurred, the award may be set aside by what is called a *requête civile*; and even where nothing can be alleged against the formal correctness of the proceedings, if one of the parties be dissatisfied with the judgment, he is at liberty (unless the right has been expressly renounced) to appeal to a superior court: when this happens, the whole case is re-opened before the tribunal of appeal, and the merits investigated anew; and when an award is brought under the consideration of a court in any of these ways, any final judgment which the court may have pronounced may be brought before the Court of Cassation, and there quashed if erroneous in point of law.

The second kind, which is called 'compulsory arbitration,' is where the parties are by law required to submit to a reference, and are precluded from having recourse to any other mode of litigation. The ancient laws of France introduced this species of arbitration very extensively for the settlement of disputes respecting either mercantile transactions or family arrangements; but by the codes now in force, it is admitted in one case only, that of differences between partners. Over such differences the ordinary courts have no jurisdiction whatever in the first instance, even by the consent of the parties; but the commercial courts exercise a superintending and controlling authority over the proceedings. Thus the arbitrators may either be appointed by the deed of partnership, or afterwards nominated by the partners; but if, when a dispute has arisen, one of the partners refuses to nominate an arbitrator or nominates an improper person, the commercial court, upon application made by the other partner, will appoint one for him; but the authority of the person so appointed will be superseded, if at any time before he enters upon his functions an arbitrator is duly nominated by the partner in delay: and when the firm consists of several partners, upon an application being made by any one of them, the court, after taking into consideration how far their respective interests are identical and how far they are conflicting, will regulate accordingly the number of arbitrators to be appointed by each. The sentence of the arbitrators, howsoever appointed, is decided by the majority of votes.

The authority of the arbitrators in this case partakes more of the judicial character than it does in voluntary arbitration; they are considered as being substituted for the ordinary commercial tribunal; their sentence is accordingly registered among the records of the court: and for the same reason also they stand upon the same footing with the court, both in the power of sentencing the parties to imprisonment and, unless the right has been renounced by the parties, in the liability of appeal from their decision. (*Code de Commerce*, art. 51-64.)

Besides the compulsory arbitration in matters of partnership, the parties who enter into any engagement are at liberty to stipulate that all differences arising between them shall be submitted to arbitration. This stipulation is compulsory, and the court will, if requisite, appoint an arbitrator ex officio for the party who should refuse to do so; but it is not exclusive, so as to take away the jurisdiction of the ordinary tribunals; it may be rescinded by the consent of the parties, or waived by their acts.

The third kind of arbitration is distinguished by the appellation of the persons to whom the reference is made; they are not called, as in the other cases, *arbitres*, but *aimables compositeurs*, or in the older law, *arbitrateurs*. The peculiar characteristics of this amicable composition are, that the referees are not, as in other cases, bound to adhere rigorously to the rules of law, but are authorized to decide according to what they conceive to be the real merits of the case; that in the exercise of this discretion their decision is final, and without appeal to any other tribunal. In case of irregularity or misconduct, the award may be set aside by the judgment of a court, but this judgment cannot be further questioned in the Court of Cassation. This modification of the general law may be introduced into all arbitrations, whether voluntary or compulsory. (See Pardessus, *Cours de Droit Commercial*, § 1386-1419.)

In Denmark and its dependencies, *Courts of Arbitration* or Conciliation were established about the year 1795, and are said to have been attended with extremely beneficial effects. In Copenhagen the court is composed of one of the judges of the higher courts of judicature, one of the magistrates of the city, and one of the representatives of the commonalty. In other towns, the chief magistrate proposes five or six of the more respectable citizens for arbitrators, of

whom the commonalty of the town elect two. In the country, the bailiffs or sheriffs are the arbitrators, and generally act as such personally; but in extensive districts they have authority to appoint deputies. All matters of civil litigation may be referred to these official arbitrators; who in the country sit once in every week, and in the capital as often as occasion requires. It appears that, after investigating a disputed case, the arbitrators in these tribunals have no power to compel the parties to settle their differences in the manner proposed by the court: if they agree, the terms of the arrangement are registered, and it has then the force of a judicial decree; if, after stating their differences and hearing the suggestions of the arbitrators, the parties still disagree, no record is made of the proceeding, and they are at liberty to discuss their respective rights in the ordinary courts of justice. It is necessary, however, that before a suitor commences an action in the superior courts, he should prove that he has already applied to one of the courts of conciliation. These courts, which are attended with very small expense to the suitors, were, soon after their establishment, multiplied rapidly in Denmark and Norway, and are said to have produced an astonishing decrease in the amount of contentious litigation. (See *Tableau des Etats Danois*, par Catteau, tome i., p. 296.)

ARBLAST, or ARBALEST, was the name more particularly given to the cross-bow. Robert of Gloucester, in his *Chronicle*, published by Hearne, p. 378, makes an especial difference between the bowmen and the *arblasters* or *arblastiers*, the cross-bowmen. In the Latin of the middle age it is called *arcubalista*, from *arcus*, a bow, and the Greek word βάλλω, to cast or shoot.

The precise date and origin of the arbalest is unknown; but it seems easily derivable from the larger species of halistæ. Vegetius is inclined to consider the *scorpio* to be the same as the cross-bow; he speaks of scorpions, which he says they now name *manuballistæ*; and in later writers the modern weapon is sometimes termed *scorpio manualis*.

Pitiscus, in his *Lexicon*, has assigned the introduction of the arbalest into the Roman armies to the time of Constantine, or a little earlier.

Strutt thought that the cross-bow was introduced into England about the thirteenth century; but Daines Barrington comes probably nearer to the truth (*Archæologia*, vol. vii. p. 46), when he inclines to the opinion, that it was the arbalest, and not the long bow, which was used with such destructive effect at the battle of Hastings by the Normans. There can be little doubt but that the arbalest was introduced by the Normans at their first arrival. We have no mention whatever of it in any writer or document of the Saxon times, but in the *Domesday Survey*, compiled in 1086, we have several *arcubalistarii*, captains of cross-bow men, among the tenants in chief. No such appellation is given in that record to any person who held lands in the time of King Edward the Confessor.

Brompton, in Twysden's *Scriptores*, col. 1278, says, that the use of the arbalest having been laid aside, was revived by King Richard I., who was afterwards killed by an arrow shot from one at the siege of Chalus.

The arrows for the cross-bow were called quarrels, from the French *carreaux*. More will be said of the use of the cross-bow in the account of ARCHERY.

ARBOGAST, LOUIS FREDERIC ANTOINE, was born at Mutzig in Alsace, in 1759. According to the account given in the *Biographie Universelle*, he was successively professor of mathematics at the school of artillery at Strasburg, and rector of the university of the same town. He afterwards represented the department of the Lower Rhine in the national convention, where, however, he took no prominent part in politics, and his name only appears to some reports on scientific subjects. He was also a principal actor in the formation of the committee of public instruction, to the affairs of which he particularly devoted himself. After the dissolution of the convention, he became professor of mathematics in the central school of his department at Strasburg, where he died April 8, 1803, leaving a name which must be placed high among those of the analysts of his day, and a character without reproach.

Arbogast's first work was presented to the Academy of Sciences, under the title of *Essai sur de Nouveaux Principes de Calcul Différentiel et Intégral, indépendants de la Théorie des infiniment Petits, et de celle de Limites*. This essay is not printed, but from his own account of it in the preface to the *Calcul des Derivations*, it appears that he had, partially

at least, anticipated the leading points of the *Théorie des Fonctions de Lefrange*.

In 1790 (Lacroix, *Calc. Diff.*, 1792; *Biog. Univ.*) he gained the prize proposed by the academy of Petersburg for an essay on the nature of the arbitrary functions contained in the integrals of partial differential equations. In this paper he takes, and in the opinion of Lacroix finally establishes, the view maintained by Lagrange and Euler against D'Alembert, in favour of the discontinuity (Lacroix, *Calc. Diff.*, vol. ii., p. 686).

But his great work is the *Calcul des Derivations*, published at Strasburg in 1800. Its main object, and we can here state no more, is the law of derivation of the successive coefficients of a development from one another, when the expression is more complicated than a function of a binomial. Therefore Taylor's theorem and common differentiation are particular cases of Arbogast's method. It is an embarrassing work to read, on account of the number of new notations, and the complexity of the algebraical part; but it contains much that is elegant, and which may eventually become useful. M. Lacroix thinks that it has not been received with sufficient favour, and cites an unpublished memoir of M. Franeais, who was in habits of intimacy with M. Arbogast, and corrected the proofs of his work, in which the former had applied the method to a question of mechanics, and had succeeded in a development which he (M. Lacroix) thinks would be almost impracticable by common methods.

We must not omit to mention, that the *Calcul des Derivations* contains the first use of the separation of symbols of operation and of quantity, which has since thrown so much light on the connexion of various parts of analysis. (See Lacroix, *Calc. Diff.*, vol. iii., p. 726.)

ARBOIS, a town in France, in the department of Jura, and the arrondissement of Poligny, about six miles N.E. from the town of Poligny, and twenty-three miles in the same direction from Lons le Saunier, the capital of the department. It is on the south bank of the little river Cuisance (a feeder of the Loue, which empties itself into the Doubs, and so into the Saone and Rhone), not far from the north-eastern ridge of Jura. It is neat and well built. The wines of the neighbourhood of Arbois are highly esteemed, especially that which, from being made at the commencement of winter, has the name of *vin-de-gelée* (frost wine). Leather, paper, and china, are among its manufactures. The population in 1826 was between 6000 and 7000. It is the seat of a *tribunal de première instance* (a subordinate civil and criminal court) under the *Cour Royale* (assize court) of Besançon. Before the revolution there were several religious establishments at Arbois.

It possesses some Celtic and Roman monuments, and has the ruins of an antient castle, which is considered by the inhabitants to be haunted. The tradition is thought to have originated from, or been confirmed by, an act of cruelty committed by Mahaut of Arbois, Countess of Burgundy, who when some poor persons had taken refuge with her in time of famine, ordered them to be confined in a large building, and burnt in it. Lat. 46° 55' N., long. 5° 56' E. of Greenwich.

This town gave birth to General Pichegru. (M. Brun, Balbi, *Dict. Universel de la France*.)

ARBROATH. [See ABERBROTHWICK.]

ARBUTHNOT, JOHN, a celebrated wit and physician in the latter part of the seventeenth and the early part of the eighteenth century. His father was a clergyman of the Scotch episcopal church.

Arbuthnot was educated in the University of Aberdeen, where he took his doctor's degree in medicine. The revolution having deprived his father of his church preferment, and a small paternal estate being insufficient for the comfortable support of the family, the Doctor came to London in pursuit of fortune. He began by teaching mathematics as a means of subsistence. Dr. Woodward's *Essay towards a Natural History of the Earth*, published in 1695, contained an account of the universal deluge, which Dr. Arbuthnot thought to be irreconcilable with philosophical truth. He therefore drew up a work entitled *An Examination of Dr. Woodward's Account of the Deluge, with a Comparison between Steno's Philosophy and the Doctor's, in the case of Marine Bodies dug out of the Earth*, 1697, 8vo., which brought him into notice as an author. His extensive learning and conversational talents introduced him gradually into practice, and he became emi-

nent in his profession. He had the good fortune to be at Epsom, when Prince George of Denmark was suddenly taken ill; and being called in to attend him, his treatment was so successful, that the prince, from the time of his recovery, employed him as his regular physician. Arbuthnot was appointed physician in ordinary to Queen Anne in 1709, and admitted a fellow of the College of Physicians. He had for some years before been a Fellow of the Royal Society.

His talents, learning, and fascinating manners, introduced him to an intimate correspondence and friendship with Pope, Swift, Gay, Parnell, and other leading wits of the period, who were all associated as members of the Scriblerus Club. In 1714 he engaged with Swift and Pope in a design to write a satire on the abuse of human learning in every branch. It was to have been executed in the humorous manner of Cervantes. Fictitious adventures were to have been worked up with mock solemnity and all the pretensions of history. But the project was stopped by the queen's death, when nothing more than an imperfect essay towards it had been drawn out, under the title of the first book of the *Memoirs of Martinus Scriblerus*. This fragment is to be found in some editions of Pope's works. There is nothing like it in our language, nor to the best of our knowledge, in any other; it is characterized by a brilliancy and exuberance, not to say extravagance, of wit and humour, which is pretty sure to tempt any who has once read it to a second perusal. *Gulliver's Travels* are said by Warburton to have been first intended as a part of these Memoirs: allusion is made to them in the 13th chapter. The treatise, *Of the Art of Sinking in Poetry*, the *Virgilius Restauratus*, and the report *Stradling v. Stiles*, are detached portions of the same work; of which the eminent writer above named speaks thus:—'Polite letters never lost more than by the defeat of this scheme, in which each of this illustrious triumvirate would have found exercise for his own peculiar talent, besides constant employment for that they all held in common. For Arbuthnot was skilled in everything which related to science: Pope was a master in the fine arts; and Swift excelled in the knowledge of the world. Wit they had all in equal measure; and this so large, that no age, perhaps, ever produced three men to whom nature had more bountifully bestowed it, or art had brought it to higher perfection.' The humorous political pamphlet of *John Bull*, which has served as the model for many *jeux d'esprits* upon the same plan, is generally believed to have been written by Arbuthnot, though attributed at the time to Swift, and published in the collection of his works. Swift, however, in his letters names Arbuthnot as the author. This piece, which is entitled *Law is a Bottomless Pit, or the History of John Bull*, contains a burlesque account of the war which broke out on the accession of a branch of the house of Bourbon to the throne of Spain in 1700, and was terminated by the peace of Utrecht in 1711. The war is described under the semblance of a lawsuit, carried on by the contending parties of England, Holland, and Austria against France and Spain, which are designated by names emblematic of the national distinctive qualities usually ascribed to each of them.

The queen's death, and the consequent disasters which befell his friends, deeply affected Arbuthnot's spirits. As a relief to his melancholy, he went to Paris; but after a short stay returned to London, and having lost his place and official residence at St. James's, he took a house in Dover-street, observing to Swift, that he still hoped to be able to keep a little habitation warm in town. In 1705 he published *Tables of Ancient Coins, Weights, and Measures, &c.*, in octavo, republished in 1727 in quarto. He continued the practice of medicine with success, and amused his intervals of leisure in writing papers of wit and humour. In 1731 he published his *Essay on the Nature and Choice of Aliments*, which was followed the year after by an *Essay on the Effects of Air on Human Bodies*. He is thought to have been led to the subjects of these treatises by studied attention to his own asthma, which had gradually increased with years, and at length was found to be incurable. In 1734 he retired to Hampstead in hope of some relief; but died at his house in Cork-street, Burlington-gardens, in February 1735. He was married and had four children.

His son George enjoyed a profitable place in the Exchequer, and was one of Pope's executors. Two daughters survived him, but died unmarried. Anne was honoured by a legacy in Pope's will. His son John died two years before him; and from Arbuthnot's affectionate expression,

that he 'would willingly have redeemed his life with his own,' it is probable that grief aggravated his disease, and hastened its termination.

Pope, in a letter to Digby, says that the first time he saw the Doctor, Swift observed to him that the Doctor was a man who could do everything but walk. The observation was made in reference to a peculiar slouch in his gait, upon which Swift comments in one of his letters. Arbuthnot appears to have been in every respect a worthy and accomplished man. He was inferior to none of his brilliant contemporaries in humour, liveliness, and learning, and few of them could compare with him in the strict performance of moral duties, or in acts of humanity and benevolence. The fortitude displayed in his letter to Pope, written almost on his death-bed, could have been inspired only by a conscience void of offence, and the calm retrospect of a well-spent life. No person of right mind and feelings can read that letter without admiring the writer, and feeling better from the perusal. In 1751 two volumes in 12mo. were published at Glasgow, entitled the *Miscellaneous Works of the late Dr. Arbuthnot*. It is stated in an advertisement, that 'the contents of these volumes, and what is inserted in Swift's *Miscellanies*, comprehend all the pieces of wit and humour of this admirable author.' The collection contains many of his undoubted productions; but the genuineness of several pieces is negated both by the internal evidence of discrepant style and inferior taste, and by the direct testimony of Mr. George Arbuthnot. To his other accomplishments, Dr. Arbuthnot added the knowledge of music, and some skill in composition. Sir John Hawkins, in his *History*, mentions an anthem composed by him. Kippis, *Biog. Britann.*; also Pope and Swift's *Correspondence*.

A'R BUTUS, a genus of evergreen shrubs, belonging to the natural order *Ericææ*. It is characterised by its fruit being a berry, containing many seeds. The most remarkable species is the arbutus of Virgil, now called *A. unedo*, or the strawberry tree, from the resemblance borne by its berries to that well-known fruit. It is a native of the south of Europe and the Levant; in our gardens it proves a hardy evergreen tree, sometimes as much as eighteen or twenty feet high, bearing its greenish-yellow blossoms in October and November, and its bright yellow and red berries, which are studded with little projections, in November and the succeeding months. The most interesting specimens in this country are at the lake of Killarney, where they form groves of great beauty: the plant can scarcely, however, be considered indigenous to Ireland on this account. Its berries are hardly eatable: taken in too great quantities they are apt to produce stupefaction; nevertheless a wine, said to be pleasant enough, is prepared from them in Corsica. Three varieties are found in the nurseries; one with deep red flowers, called the scarlet arbutus, which is much more beautiful than the original species; a second, with double greenish flowers and a smaller foliage; and a third, with leaves which are not at all cut at the edge: the two last are mere objects of curiosity. They are all increased by grafting upon the wild species, and by cuttings or layers of the young shoots; the wild kind itself springs up readily from seeds, by means of which it may be multiplied in great abundance. Considering this circumstance, and its great beauty, it is quite surprising that we do not see it more frequently planted in large masses.

The *Oriental Arbutus*, *A. andrachne*, is superior to the last in beauty both of leaves and flowers, but it is much more tender, and does not bear fruit in Great Britain. It is readily known by its broader and less serrated leaves, and by its bark peeling off so as to leave the stem always smooth and of a clear, bright cinnamon-brown. Native of the Levant.

A. hybrida, or the mule arbutus, is apparently a hybrid between the two last, agreeing with *A. unedo* in the general aspect of its foliage, which is, however, larger and more handsome, and with *A. andrachne* in flowers and in the deciduous bark. It is hardy, and very ornamental, but it does not bear berries.

The other species are chiefly American, and of less general interest: one of them, *A. procera*, exists in the gardens of this country, but it does not seem likely to be able to endure our climate. It is a native of New Albion, where it forms a moderately-sized tree; another, *A. mucronata*, from the Straits of Magellan, is a hardy evergreen bush, with small, very dark, pointed and serrated leaves, among which

long numbers of solitary white blossoms. It has lately begun to flower about London, but is still a rare plant. It requires to be grown in peat soil.

For other species of *arbutus* see *ARCTOSTAPHYLOS*.

ARC, from the Latin *arcus*, a bow, signifies any part of a curve line, as *A C B*. The straight line *A B*, which joins the extremities of the arc, is called its *CHORD*.

For the arc of a *circle*, see *ANGLE*, where the method of finding the arc from its angle, and the converse, is given. For the properties of the arcs of various curves, see their several names.

It is found necessary to assume the following axiom previously to any general investigation of the properties of an arc. Every arc is greater than its chord, but, when concave to the chord throughout, is less than the sum of the sides of any rectilinear figure which contains it. Thus *A C B* is greater than *A B*, but less than the sum of *A D*, *D E*, and *E B*. If *x* and *y* be the co-ordinates of any point in the curve, the general method of finding the arc is by the integration of the formula

$$\sqrt{dx^2 + dy^2},$$

or, in the language of the fluxional calculus,

$$\text{fluent of } \sqrt{x^2 + y^2}.$$

The practical method of finding the length of an arc, which is an approximation to the preceding process, is as follows. Divide the arc into a number of smaller arcs, making the number large in proportion to the degree of accuracy required, and add together the chords of the smaller arcs. The sum of the chords will differ very little from the arc, even when the number of sub-divisions is not very large. For instance, the arc of the quadrant of a circle, whose diameter is ten million of inches, is 7,853,982 inches, within half an inch. Divide this quadrant into ten equal parts, and the sum of the chords is 7,845,910 inches: divide the quadrant into fifty parts, and the same sum is 7,853,659 inches, which is not wrong by more than one part out of 24,316. For only twenty subdivisions the sum of the chords is 7,851,963 inches, wrong only by one part out of 3890. Therefore, for every practical purpose, an arc of a circle (and the same may be said of every other curve) is the polygon made by the chords of a moderate number of sub-divisions of the arc.

The preceding property is (but in what manner our limits will not permit us to show) a consequence of the following proposition. Let there be a number of arcs, such as *A C B*, cut off the same curve, having their chords parallel to the tangent

X C Y. Then, as *A B* moves parallel to its first position towards *X Y*, *C D* not only decreases without limit, but its proportion to *A B* decreases without limit; that is, let any number, however great, be named; then shall *A B*, before it reaches *X Y*, reach a position in which it contains *C D* more than that number of times. This proposition is startling to the beginner in mathematics, and should be considered by him with great attention. It may be illustrated in the following manner:—Suppose that while *A B* moves from its first position towards *X Y*, and has reached *a b*, a microscope moves with and over it, which increases in magnifying power as *a b* moves in such a manner that *a b* always appears in the glass as large as *A B* to the naked eye. Then *A C b* will not be magnified into the form *A C B*, but into *A Q B*, where *Q D* grows less and less without limit, as *a b* approaches towards *X Y*. But if two straight lines had been taken, as in the following figure, *a b* could not have been magnified to *A B* without changing *a C b* into *A C B*.

Formerly, the term arc was frequently confounded with angle, which arose from the practice of measuring angles by arcs of the circle. For such terms as *ARC OF ELEVATION* &c., we refer to *ANGLE OF ELEVATION*, &c.

ARC, JOAN or JEANNE OF, surnamed the 'Maid of Orleans,' from her heroic defence of that city, was born about the year 1410 or 1411, in the little hamlet of Domremy, near the Meuse, and about three leagues south of Vaucouleurs, on the borders of Champagne. Her parents were humble and honest peasants. The district was remarkable for the devout simplicity of its inhabitants, as well as for those romantic superstitions which in a rude age are so often allied with religion. It appears from the copious depositions of witnesses from the neighbourhood of Domremy, examined at Joan's trial, that she was unerring in her prayers, and other religious exercises, and was strongly imbued, at a very early age, with the prevailing superstitions of her native place.

During that period of anarchy in France, when the supreme power which had fallen from the hands of a monarch deprived of his reason was disputed for by the rival houses of Orleans and Burgundy, the contending parties carried on war more by murder and massacre than by regular battles. When an army was wanted, both had recourse to the English, and these conquering strangers made the unfortunate French feel still deeper the horror and ravages of war. At first, the popular feeling was undecided; but when, on the death of Charles VI, the crown fell to a young prince who adopted the Armagnac, whilst the house of Burgundy had sworn allegiance to a foreigner (Henry V.) as king of France, then, indeed, the wishes and interests of all the French were in favour of the Armagnacs, or the truly patriotic party. Remote as was the village of Domremy, it was still interested in the issue of the struggle. It was decidedly Armagnac, and was strengthened in this sentiment by the rivalry of a neighbouring village which adopted Burgundian colours.

Political and party interests were thus forced upon the enthusiastic mind of Joan, and mingled with the legends which she had caught from the traditions of the Virgin. A prophecy was current, that a virgin should save France of its enemies; and this prophecy seems to have been realised by its effect upon the mind of Joan. The girl, by her own account, was about thirteen when a supernatural vision first appeared to her. She describes it as a great light, accompanied by a voice telling her to be devout and good, and promising her the protection of heaven. Joan responded by a vow of eternal chastity. In this there appeared nothing beyond the effect of imagination. From that time the voice or voices continued to haunt Joan, and to excite the enthusiastic and restless wishes of her own heart. We shall not lay much stress on her declarations made before those who were appointed by the king to inquire into the credibility of her mission. Her own simple and true account was, that 'voices' were her visitors and advisers, and that they prompted her to quit her native place, to take up arms, drive the foe before her, and procure for the

young king his coronation at Rheims. These voices, however, had not influence enough to induce her to set out upon the hazardous mission, until a band of Burgundians, traversing and plundering the country, had compelled Joan, together with her parents, to take refuge in a neighbouring town: when they returned to their village, after the departure of the marauders, they found the church of Domremy in ashes. Such incidents were well calculated to arouse the indignation and excite the enthusiasm of Joan. Her voices returned, and incessantly directed her to set out for France; but to commence by making application to De Baudricourt, commander at Vaucouleurs. Her parents, who were acquainted with Joan's martial propensities, attempted to force her into a marriage; but she contrived to avoid this by paying a visit to an uncle, in whose company she made her appearance before the governor of Vaucouleurs, in May, 1428. De Baudricourt at first refused to see her, and, upon granting an interview, treated her pretensions with contempt. She then returned to her uncle's abode, where she continued to announce her project, and to insist that the prophecy, that 'France, lost by a woman (Isabel of Bavaria), should be saved by a virgin from the frontiers of Lorraine,' alluded to her. She it was, she asserted, who could save France, and not 'either kings, or dukes, nor yet the king of Scotland's daughter'—an expression which proves how well-informed she was as to the political events and rumours of the day.

The fortunes of the dauphin Charles at this time had sunk to the lowest ebb; Orleans, almost his last bulwark, was besieged and closely pressed, and the loss of the 'battle of Herrings' seemed to take away all hope of saving the city from the English. In this crisis, when all human support seemed unavailing, Baudricourt no longer despised the supernatural aid promised by the damsel of Domremy, and gave permission to John of Metz and Bertram of Poulengy, two gentlemen who had become converts to the truth of her divine mission, to conduct Joan of Arc to the dauphin. They purchased a horse for her, and at her own desire furnished her with male habits, and other necessary equipments. Thus provided, and accompanied by a respectable escort, Joan set out from Vaucouleurs on the 13th of February, 1429. Her progress, through regions attached to the Burgundian interest, was perilous, but she safely arrived at Fierbois, a place within five or six leagues of Chinon, where the dauphin then held his court. At Fierbois was a celebrated church dedicated to St. Catherine, and here she spent her time in devotion, whilst a messenger was despatched to the dauphin to announce her approach. She was commanded to proceed, and reached Chinon on the eleventh day after her departure from Vaucouleurs.

Charles, though he desired, still feared to accept the proffered aid, because he knew that the instant cry of his enemies would be, that he had put his faith in sorcery, and had leagued himself with the infernal powers. In consequence of this, Joan encountered every species of distrust. She was not even admitted to the dauphin's presence without difficulty, and was required to recognize Charles amidst all his court; this Joan happily was able to do, as well as to gain the good opinion of the young monarch by the simplicity of her demeanour. Nevertheless, the prince proceeded to take every precaution before he openly trusted her. He first handed her over to a commission of ecclesiastics, to be examined; then sent her for the same purpose to Poitiers, a great law-school, that the doctors of both faculties might solemnly decide whether Joan's mission was from heaven or from the devil; for none believed it to be merely human. The greatest guarantee against sorcery was considered to be the chastity of the young girl, it being an axiom, that the devil would not or could not take part with a virgin; and no pains were spared to ascertain her true character in this respect. In short, the utmost incredulity could not have laboured harder to find out imposture, than did the credulity of that day to establish its grounds of belief. Joan was frequently asked to do miracles, but her only reply was, 'Bring me to Orleans, and you shall see. The siege shall be raised and the dauphin crowned king at Rheims.'

They at length granted her request, and she received the rank of a military commander. A suit of armour was made for her, and she sent to Fierbois for a sword, which she said would be found buried in a certain spot within the church. It was found there, and conveyed to her. The circumstance became afterwards one of the alleged proofs of her sorcery

or imposture. Her having passed some time at Fierbois amongst the ecclesiastics of the place must have led, in some way or other, to her knowledge of the deposit. Strong in the conviction of her mission, it was Joan's desire to enter Orleans from the north, and through all the fortifications of the English. Dunois, however, and the other leaders, at length overruled her, and induced her to abandon the little company of pious companions which she had raised, and to enter the beleaguered city by water, as the least perilous path. She succeeded in carrying with her a convoy of provisions to the besieged. The entry of Joan of Arc into Orleans, at the end of April, was itself a triumph. The hearts of the besieged were raised from despair to a fanatical confidence of success; and the English, who in every encounter had defeated the French, felt their courage paralyzed by the coming of this simple girl. Joan announced her arrival to the foe by a herald, bearing a summons to the English generals to be gone from the land, or she, the Pucelle, would slay them. The indignation of the English was increased by their terror; they detained the herald, and threatened to burn him, as a specimen of the treatment which they reserved for his mistress. But in the mean time the English, either from being under the influence of terror, or through some unaccountable want of precaution, allowed the armed force raised and left behind by Joan, to reach Orleans unmolested, traversing their entrenchments. Such being the state of feeling on both sides, Joan's ardour impelled her to take advantage of it. Under her banner, and cheered by her presence, the besieged marched to the attack of the English forts one after another. The first carried was that of St. Loup, to the east of Orleans. It was valiantly defended by the English, who, when attacked, fought desperately; but the soldiers of the Pucelle were invincible. On the following day, the 6th of May, Joan, after another summons to the English, signed 'Jhesus Maria and Jehanne La Pucelle,' renewed the attack upon the other forts. The French being compelled to make a momentary retreat, the English took courage, and pursued their enemies: whereupon Joan, throwing herself into a boat, crossed the river, and her appearance was sufficient to frighten the English from the open field. Behind their ramparts they were still, however, formidable; and the attack led by Joan against the works to the south of the city is the most memorable achievement of the siege. After cheering on her people for some time, she had seized a scaling-ladder, when an English arrow struck her between the breast and shoulder, and threw her into the fosse. When her followers took her aside, she showed at first some feminine weakness, and wept; but seeing that her standard was in danger, she forgot her wound, and ran back to seize it. The French at the same time pressed hard upon the enemy, whose strong hold was carried by assault. The English commander, Gladesdall, or Glacidas, as Joan called him, perished with his bravest soldiers in the Loire. The English now determined to raise the siege, and Sunday being the day of their departure, Joan forbade her soldiers to molest their retreat. Thus in one week from her arrival at Orleans was the beleaguered city relieved of its dreaded foe, and the Pucelle, henceforth called the Maid of Orleans, had redeemed the most incredible and important of her promises.

No sooner was Orleans freed from the enemy, than Joan returned to the court, to entreat Charles to place forces at her disposal, that she might reduce the towns between the Loire and Rheims, where she proposed to have him speedily crowned. Her projects were opposed by the ministers and warriors of the court, who considered it more politic to drive the English from Normandy than to harass the Burgundians, or make sacrifices for the idle ceremony of a coronation; but her earnest solicitations prevailed, and early in June she attacked the English at Jargeau. They made a desperate resistance, and drove the French before them, till the appearance of Joan chilled the stout hearts of the English soldiers. One of the Poles was killed, and another, with Suffolk the commander of the town, was taken prisoner. This success was followed by a victory at Patay, in which the English were beaten by a charge of Joan, and the gallant Talbot himself taken prisoner. No force seemed able to withstand the Maid of Orleans. The strong town of Troyes, which might have repulsed the weak and starving army of the French, was terrified into surrender by the sight of her banner; and Rheims itself followed the example. In the middle of July, only three months after Joan had come to the relief of the sinking party of

Charles, this prince was crowned in the cathedral consecrated to this ceremony, in the midst of the dominions of his enemies. Well might an age even more advanced than the fifteenth century believe, that superhuman interference manifested itself in the deeds of Joan.

Some historians relate that, immediately after the coronation, the Maid of Orleans expressed to the king her wish to retire to her family at Domremy; but there is little proof of such a resolution on her part. In September of the same year, we find her holding a command in the royal army, which had taken possession of St. Denis, where she hung up her arms in the cathedral. Soon after, the French generals compelled her to join in an attack upon Paris, in which they were repulsed with great loss, and Joan herself was pierced through the thigh with an arrow. It was the first time that a force in which she served had suffered defeat. Charles immediately retired once more to the Loire, and there are few records of Joan's exploits during the winter. About this time a royal edict was issued, ennobling her family, and the district of Domremy was declared free from all tax or tribute. In the ensuing spring, the English and Burgundians formed the siege of Compiègne; and Joan threw herself into the town to preserve it, as she had before saved Orleans, from their assaults. She had not been many hours in it when she headed a sally against the Burgundian quarters, in which she was taken by some officers, who gave her up to the Burgundian commander, John of Luxembourg. Her capture appears, from the records of the Parisian parliament, to have taken place on the 23rd of May, 1430.

As soon as Joan was conveyed to John of Luxembourg's fortress of Beaufort, near Cambrai, cries of vengeance were heard among the Anglican partizans in France. The English themselves were not foremost in this unworthy zeal. Joan, after having made a vain attempt to escape by leaping from the top of the donjon at Beaufort, was at length handed over to the English partizans, and conducted to Rouen. The University of Paris called loudly for the trial of Joan, and several letters are extant, in which that body reproaches the bishop of Beauvais and the English with their tardiness in delivering up the Pucelle to justice.

The zeal of the University was at length satisfied by letters patent from the King of England and France, authorizing the trial of the Pucelle, but stating in plain terms that it was at the demand of public opinion, and at the especial request of the bishop of Beauvais and of the University of Paris,—expressions which, taken in connexion with the delay in issuing the letters, sufficiently prove the reluctance of the English council to sanction the extreme measure of vengeance. After several months' interrogatories, the judges who conducted the trial drew from her confessions the articles of accusation: these asserted, that Joan pretended to have had visions from the time when she was thirteen years old; to have been visited by the archangels Gabriel and Michael, the saints Catharine and Margaret, and to have been accompanied by these celestial beings to the presence of the Dauphin Charles; that she pretended to know St. Michael from St. Gabriel, and St. Catharine from St. Margaret; that she pretended to reveal the future; and had assumed male attire by the order of God. Upon these charges her accusers wished to convict her of sorcery. Moreover, they drew from her answers, that she declined to submit to the ordinances of the church whenever her voices told her the contrary. This was declared to be heresy and schism, and to merit the punishment of fire.

These articles were dispatched to the University of Paris, and all the faculties agreed in condemning such acts and opinions, as impious, diabolical, and heretical. This judgment came back to Rouen; but it appears that many of the assessors were unwilling that Joan should be condemned; and even the English in authority seemed to think imprisonment a sufficient punishment. The truth is, that Joan was threatened with the stake unless she submitted to the church, as the phrase then was, that is, acknowledged her visions to be false, forswore male habits and arms, and owned herself to have been wrong. Every means were used to induce her to submit, but in vain. At length she was brought forth on a public scaffold at Rouen, and the bishop of Beauvais proceeded to read the sentence of condemnation, which was to be followed by burning at the stake. Whilst it was reading, every exhortation was used, and Joan's courage for once failing, she gave utterance to words of contrition, and expressed her willingness to submit, and save herself from the flames. A written

form of confession was instantly produced, and read to her, and Joan, not knowing how to write, signed it with a cross. Her sentence was commuted to perpetual imprisonment, 'to the bread of grief and the water of anguish.' She was borne back from the scaffold to prison; whilst those who had come to see the sight displayed the usual disappointment of unfeeling crowds, and even threw stones in their anger.

When brought back to her prison, Joan submitted to all that had been required of her, and assumed her female dress; but when two days had elapsed, and when in the solitude of her prison the young heroine recalled this last scene of weakness, forming such a contrast with the glorious feats of her life, remorse and shame took possession of her, and her religious enthusiasm returned in all its ancient force. She heard *her voices* reproaching her, and under this impulse she seized the male attire which had been perfidiously left within her reach, put it on, and avowed her altered mind, her resumed belief, her late visions, and her resolve no longer to belie the powerful impulses under which she had acted. 'What I resolved,' said she, 'I resolved against truth. Let me suffer my sentence at once, rather than endure what I suffer in prison.'

The bishop of Beauvais knew that if Joan were once out of the power of the court that tried her, the chapter of Rouen, who were somewhat favourably disposed, would again give her up to punishment; and fears were entertained that she might ultimately be released, and gain converts. It was resolved, therefore, to make away with her at once, and the crime of relapse was considered sufficient. A pile of wood was prepared in the old market at Rouen, and scaffolds placed round it for the judges and ecclesiastics: Joan was brought out on the last day of May, 1431; she wept piteously, and showed the same weakness as when she first beheld the stake. But now no mercy was shown. They placed on her head the cap used to mark the victims of the Inquisition, and the fire soon consumed the unfortunate Joan of Arc. When the pile had burned out, the ashes were gathered and thrown into the Seine.

It is difficult to say to what party most disgrace attaches on account of this barbarous murder: whether to the Burgundians, who sold the Maid of Orleans; the English, who permitted her execution; the French, of that party who brought it about and perpetrated it; or the French, of the opposite side, who made so few efforts to rescue her to whom they owed their liberation and their national existence. The story of the Maid of Orleans is throughout disgraceful to every one, friend and foe; it forms one of the greatest blots and one of the most curious enigmas in historic record. It has sometimes been suggested that she was merely a tool in the hands of the priests; but this supposition will hardly satisfy those who read with attention the history of Joan of Arc.

It is asserted (*Biog. Univ.*, art. Jeanne d'Arc), and probably correctly, that there is no genuine likeness of Joan of Arc extant. Our medal is taken from a French work: *Les Familles de la France illustrées par les monumens, &c. Tirées des plus rares et curieux cabinets du Royaume, &c.* Par J. de Bie Calographe, Paris, 1634.

The works on the subject of Joan of Arc are very numerous. M. Chausard enumerates upwards of four hundred, either expressly devoted to her life or including her history. Her adventures form the subject of Voltaire's poem of *La Pucelle*, and of a tragedy by Schiller; but perhaps the best production of the kind is Mr. Southey's poem bearing her name.

(The sources which have been here consulted are the original memoirs of the times, together with the numerous biographies. That of M. Lebrun des Charmettes is the fullest. It was written by a prefet, at the epoch of 1830 to flatter the Bourbons. The publication by M. Laverdy, however, of extracts from MSS. in the Bibliothèque du Roi, contains every thing relating to the trials of the Pucelle, and is a source at once ample and respectable. Unfortunately, the very trials themselves are full of partiality; that which took place afterwards for the reversal of Joan's condemnation records the testimony of witnesses, given all one way, and dictated evidently by the reaction of the period.)

ARCADE signifies a series of arches on insulated piers, forming a screen, and also the space inclosed by such. It is, perhaps, a limitation of the term within that usually given to it; but arcade is properly a correlative of colonnade, and should not therefore have a more extensive signification.

What, by a strange perversion of the term, are in this country called *piazas*, and most particularly the part so termed of the buildings in Covent Garden, London, are strictly *arcades*; and the new market within the inclosed area of that same place or square, to which the term *piazza* properly applies, exemplifies, in a great part of its exterior, the correlative term *colonnade*.

Arcade is but another and a substantive form of *arched*; and although it may be well to restrict it, as a substantive, to the meaning given above, yet it may be conveniently and appropriately used, as an adjective, instead of *arched*, as in the description of the ancient Roman aqueduct; though it would be somewhat absurd to designate such works as the bridges over the Thames at London *arcades*, or to speak of them as *arcaded*.

ARCA'DIA, one of the antient provinces of the Peloponnesus, now the Morea, comprising the central part of the peninsula, and bounded on all sides by mountains. It extended from about $37^{\circ} 15'$ to 38° N. lat., and from $21^{\circ} 52'$ to $22^{\circ} 36'$ E. long. Its greatest length from Kalávryta, the antient Cynætha in the north to Samará in the south, near which it must have been separated from Laconia, was about 50 miles. Its breadth varied from 35 to 41 miles.

On the north and north-west it was separated from Achaia and Elis by a range of mountains, which branching off from Cyllene (now Zýria), the highest point of the Peloponnesus, said to be about nine stadia, or 5400 Greek feet in height (Steph. Byz.), ran in a westerly direction, and was known by the several appellations of Aroanius, Lampeia, Erymanthus and Pholœ: on the west it was separated from Triphylia by mountains which are a southerly continuation of Pholœ, but the names of which have not been transmitted to us: on the south, its boundary towards Laconia may be considered the high land from which the water flows in opposite directions, southwards into the Eurótas and northwards into the Alpheus: its separation from Messenia was the high land W. of Lycosura, running between the bed of the Neda and the sources of the Pamisus, and containing the great mountain Tetrázi (Cerausium), a part of Lycæum. On the east it was separated from Argolis by the ridge known under the several appellations of Parthenium, Artemisium, and Trachy. Its area is calculated by Mr. Clinton (*Fusti Hellenici*, i. 385) at 1701 English square miles, being next in size to Laconia, which was the largest and most populous province of the Peloponnesus. According to the calculation of the same author, the free population of Arcadia may have amounted to 107,850 persons, and by adding half that number of slaves, he makes the aggregate amount 161,750—about ninety-five persons to each square mile, which, considering that a large part of Arcadia is fertile, is probably below the truth, at least in its most prosperous days.

Arcadia may be regarded as the Switzerland of Greece, though its mountains are of much less elevation. The centre of the Morea may be considered as a high table-land, which is traversed by numerous ridges of hills: the valleys of Tegea, Mantinea, Orchomenus, and Caphyæ, which run from south to north on the east side of Arcadia, are of considerable extent when compared with others in the Morea, and show the general level of the eastern side of this table-land: from the west side of these valleys the long slope lies westward, as we see by the course of the Alpheus and its tributaries; that to the eastern coast is more steep and shorter. The plains of Caphyæ, Tegea, Mantinea, and Orchomenus, which last is only separated from that of Mantinea by a low narrow ridge, may be considered as one: its length is about twenty-five miles, with a breadth varying from one to eight. The modern town of Tripolitza (probably on the site of Pallantium) is on this elevated plain, where, in the month of March, the ground is often covered with snow, while the sea-coast enjoys warm and pleasant weather. These eastern valleys have a very peculiar appearance, from being so enclosed by mountains that the water is often unable to find an outlet. At the lowest parts of them small lakes and marshes are formed, though sometimes the water is carried off by subterraneous tunnels. Such phenomena are of frequent occurrence in this part of Arcadia, which is a limestone country: these high valleys, in fact, belong neither to the water system of the Alpheus nor to that of the small streams which enter the sea on the east coast. Being now entirely deprived of wood, and of its three great cities, Tegea, Mantinea, and Orchomenus, the extensive plain of Tripolitza presents one dull, uninteresting level.

In the south and west, along the valleys of the Alpheus the Arcadian scenery exhibits its most picturesque features, recalling to our recollection all the beautiful descriptions of the poets. The valley of Megalopolis still abounds in delightful scenery. The sides of the majestic mountains are covered with oaks, chestnuts, and plane-trees, while the lower hills are clothed with underwood, and refreshed by numerous rivulets.

The Alpheus, the principal river of the Peloponnesus, has its source near the southern frontier of Arcadia, and runs N.W., not far from the western boundary of the province, till it encounters the slopes of Mount Pholœ, when it enters the valley of Olympia, and, flowing in a westerly direction, reaches the sea. (See ALPHEIUS.) It is joined on the east by the rivers Helisson, Gortynius, Ladon, and Erymanthus, celebrated in mythology for the scene of Hercules' exploit in killing the savage boar; on the west the mountains approach so closely to its banks that the courses of its tributaries are short, and in summer most of them dry.

The Arcadians were divided into many independent states, and each of these contained several inferior towns or villages. Of their number some idea may be formed from the fact that the inhabitants of forty of them were transferred, B.C. 371, to form the new state of Megalopolis, which was founded near the frontiers of Laconia, and which seems to have had a territory assigned to it more extensive than that of any other Arcadian state, running northwards for about twenty-three English miles. (Pausan. viii. 27. 5. 35. 5. 36. 2.) At the time when Strabo wrote, about A.D. 14, he tells us that there was scarcely a city in the whole extent of its territory, and that even Megalopolis had been reduced almost to a desert. There are now a number of insignificant villages in Arcadia, but the only place of any importance is Tripolitza, which during the existence of Turkish oppression in this unfortunate country was the chief residence of the pacha. We may mention a few of the principal antient cities, though the sites of some of them are unknown, or at least doubtful. In the north lay Psophis, near the modern Khan of Tripotamo, on the banks of the river Erymanthus, remarkable for the strength and singularity of its site: Cynætha, probably Kalávryta, whose inhabitants were distinguished from the rest of the Arcadians by the peculiar savageness and ferocity of their disposition, qualities which Polybius (iv. 21) attempts, at great length, to prove arose from their hatred to music, which was particularly cultivated by their fellow-countrymen: Stympthalus, the remains of which are found about an hour W.S.W. of the village of Zaraka, on the banks of the Palus Stympthalia, once the fabled haunt of the birds called Stympthalides: Caphyæ, the remains of which are found at Khotûsa, celebrated for the defeat of Aratus and the Achæans [see ARATUS] by the Ætolians in the Social War: Orchomenus, at Kalpáki, under which is a plain in a great measure occupied by a small lake formed from the rain-water which descends from the surrounding hills: on the east lay the important city of Mantinea, at the site of Paleopoli, celebrated for the death of Epaminondas in the great battle between the Thebans and Lacedæmonians, B.C. 362: Tegea, at Paleo Episcopi, once one of the most powerful states of Arcadia: on the west there were no cities of any great importance.

Besides the antient authorities already quoted, the reader may consult Strabo, viii. 388; Pliny, iv.; and also Breitenbach, *Geschichte von Arcadien*, Frankfurt, 1791; Leake's *Morea*; Gell's *Narrative of a Journey in the Morea*.

ARCADIANS, an indigenous race, according to their own account, who had occupied the central parts of the Peloponnesus from time immemorial. According to Aristotle (see Scholium on the Clouds of Aristophanes, l. 397), the Arcadians expelled a prior race from the country, and were therefore not the primitive possessors, if we adopt this tradition. We have no difficulty, however, in making out that they were a branch of the great Pelasgic nation, which seems to have extended, at one time, nearly in a continued line from the Italian peninsula to Asia Minor. A strong confirmation of this statement is, that Arcadia furnishes specimens of antient polygonal walls, (such as at Mantinea, and at Lycosura)—a species of architecture supposed to be peculiar to the Pelasgi; and their first king is reported to have been the earth-born Pelasgus. Pausanias, in his account of its early history, presents us only with fable; and it is therefore unnecessary to enumerate the names of the kings, which he pretends to have learned from diligent investigation.

As Arcadia is a mountainous country, and abounds in forests and grass lands, the character of its antient inhabitants and their mode of life were, to a great extent, determined by these physical circumstances. The tending of cattle and hunting were their chief occupations, and we find them often represented in all the rudeness of an uncultivated state. Men and swine alike lived on acorns, and Philostratus (lib. iii.) paints the Arcadians as little superior to the animals which they fed. With these testimonies, therefore, as to their character, we cannot but wonder how the Arcadian shepherds could have acquired their reputation for mildness and innocent simplicity, qualities by which they are best known to us. Polybius, their countryman, partly explains this circumstance, when he tells us that the Arcadians, at first fierce and savage, were softened by their diligent application to music.

In the second Messenian war, B.C. 685-668, we find the Arcadians under the command of a king, Aristocrates, whom they stoned to death on account of his treacherous behaviour to the Messenians, and the country was then divided into a number of small republics. Herodotus (vii. 202) tells us that they took part with their countrymen against Xerxes, B.C. 480, and that they sent to Thermopylæ a body of 2120 men to oppose that monarch. But if they had no larger number in the field than this, it does not speak highly for their patriotism, nor do we think that their subsequent history proves that they possessed the feelings of a united people. They were mere soldiers of fortune, ready to draw their swords in defence of any one willing to pay them. In the celebrated Sicilian expedition, B.C. 415, they were found in the ranks of both armies, nor do they appear to have acted as a nation till they had founded, under Epaminondas, the city of Megalopolis, B.C. 371, which became the metropolis of the country. From this time the Arcadians appear as a confederated state with a general council to manage the affairs of the nation. It is said to have consisted of 10,000 members (*οἱ μύριοι*), and if it were not frequently mentioned by antient writers under this appellation, we should be inclined to imagine that there must be some mistake. What makes it still more inexplicable is, that it possessed the executive and judicial powers, but not the legislative, which resided in the whole assembled people. Pausanias, in his *Arcadica* (chap. xxxii.), mentions the council-chamber (*βουλευτήριον*) of the Ten Thousand. It was Epaminondas and the Boeotians who assisted the Arcadians in establishing this constitution, and in rendering them independent of the power of the Spartans. On the death of Alexander, B.C. 323, we find the country a prey to a number of petty tyrants, and the part they took in the Achæan league did not relieve them from their difficulties, or enable them to re-establish peace and security. The Romans at last made themselves masters of their country, and included it in the province of Achaia, but their days of prosperity never returned. Strabo states, that in his time the country was desolate, and that Tegea was the only city of importance which it contained; but Strabo himself did not visit Arcadia. Pausanias, who examined Arcadia about A.D. 174, gives a minute account of its ruined cities, and of the numerous antiquities with which it abounded. (See Pausanias, book viii.; Thucydides, vii. 57; Xenophon, *Hellenica*, vii.; Diodorus, book xv.; Herodotus, viii. 73, &c.)

ARCA'DIUS, emperor of Constantinople, son of Theodosius the Great, whom he succeeded A.D. 395. Neither his personal character, nor the transactions in which he was engaged, are of a nature to attract much of our attention. He was a mere puppet in the hands of ambitious men, who pursued their own interests without reference to the prosperity of the empire or the happiness of the people. The genius of Rome expired with Theodosius; he was the last of the successors of Augustus and Constantine who was acknowledged by the whole Roman empire, and who appeared at the head of its armies. By his will he divided this mighty empire between his two young sons, Arcadius and Honorius. Arcadius became emperor of the east, reigning over the provinces of Thrace, Asia Minor, Syria, and Egypt, from the lower Danube to the confines of Persia; Honorius became, at least, nominal emperor of the West. The line which separated the two kingdoms was, in fact, much the same as that which now divides the empire of Austria from Turkey. The accession of Arcadius marked the final establishment of the empire of the East, which subsisted, till the taking of Constantinople by the Turks, during a period of 1058 years, in a state of continual decay.

It is curious, that though the period is copiously furnished with historical materials, it is not possible to fix on a single action which properly belongs to the son of Theodosius the Great. His history is nothing else than that of the men to whom he entrusted the affairs of his empire. He was at first the submissive tool of Rufinus, who had raised himself by his talents to the notice of Theodosius, and was employed by him to direct the studies of the young prince Arcadius. Rufinus employed all his influence to inveigle Arcadius into a marriage with his daughter, but failing in this object, he was accused of inviting the Huns and Goths into Asia and Greece, and was at last murdered in the presence of the emperor by the soldiers of the celebrated Stilicho. His place was soon supplied by a eunuch, Eutropius, who exceeded even Rufinus in acts of oppression and cruelty. Arcadius saw every thing with equal indifference, and cared neither for his own honour nor the security of his subjects, provided he was allowed to enjoy the pompous luxury which we find described in the eloquent sermons of St. Chrysostom, an eye-witness of the scenes which he narrates. We cannot, perhaps, give a clearer insight into the sort of life spent by these pageant emperors than by the following quotations from St. Chrysostom. (*Opera*, tom. xiii. p. 192-196.) 'The emperor wears on his head either a diadem or a crown of gold decorated with precious stones of inestimable value. These ornaments and his purple garments are reserved for his sacred person alone; and his robes of silk are embroidered with figures of golden dragons. His throne is of massive gold. Wherever he appears in public, he is surrounded by his courtiers, guards, and attendants. Their spears, shields, cuirasses, the bridles, and trappings of their horses, have either the substance or the appearance of gold. The two mules that draw the chariot of the monarch are perfectly white, and shining all over with gold. The chariot itself, of pure and solid gold, attracts the admiration of the spectators, who contemplate the purple curtains, the snowy carpet, the size of the precious stones, and the resplendent plates of gold that glitter as they are agitated by the motion of the carriage.' In the later years of his life, Arcadius was entirely under the control of his wife, Eudoxia, whose character is best shown by the fact that she persecuted the virtuous St. Chrysostom. Arcadius died May 1, 408, leaving his empire to his infant son, Theodosius. The facts of his life are to be gleaned from Claudian, Suidas, and Theodoretus.

ARCESILA'US was born at Pitana, a city of Æolis in Asia Minor; of his personal history we are able to collect a few facts from Suidas, and his Life by Diogenes Laërtius. He was born B.C. 316, and began, according to Apollodorus, to attract the attention of the learned by the acuteness of his remarks before he had reached the age of seventeen. He died B.C. 241, at the age of seventy-five. He was the pupil of the mathematician Autolycus, his compatriot, and afterwards proceeded to Athens, where it was intended that he should devote his time to the study of rhetoric. Philosophy, however, had greater charms for him, and accordingly he became the pupil of Theophrastus the peripatetic, and then of Crantor. He also made himself acquainted with the subtle dialectics of the Megaric school, and the scepticism of that of Pyrrho. He attached himself more particularly to the Academic sect, and became one of their leading philosophers, though he introduced so many changes, that he was considered the founder of what has been called the Middle Academy. The Academic sect was instituted by Plato, and continued through Speusippus, Xenocrates, Crantor, Polemo, and Crates, to Arcesilaus. It is a point which has been disputed, whether Arcesilaus had established his school in the lifetime of Polemo and Crates, or whether we are to consider him as the successor of Crates; but we think that Mr. Clinton (*Fasti Hellenici*, vol. i. p. 367) satisfactorily proves, by reference to many passages in antient authors, that Arcesilaus established his school at the death of Crantor, who died before Polemo and Crates; that from this period he was the rival of Zeno and Epicurus; that Polemo and Crates, strictly speaking, had no successors; that the old academy expired with them, and was superseded by the school of Arcesilaus, which had been founded in their lifetime.

Arcesilaus revived the Socratic mode of teaching, which had fallen into disuse; he propounded no dogmatic principles of his own, but discussed with much eloquence and art the points proposed to him by his pupils. He brought forward all the arguments that could be suggested

on both sides of a question, and endeavoured to prove that there was no certainty in philosophical knowledge, and that in all purely speculative subjects we must refrain from coming to a decision, because the mind of man cannot sufficiently distinguish truth from falsehood. He does not, however, appear to have carried these sceptical opinions into the every-day affairs of life, but to have restricted them to philosophy and science, though his opponents asserted, and with much reason, that such doctrines as he advocated tended to undermine all virtues and morality. In the world he admitted we must act as others do. The saying of the philosopher Cleanthes respecting him, clearly proves that his doctrines were not carried beyond his closet, and that in the world he was strictly attentive to all the duties of life. 'Leave him to himself,' says Cleanthes to some who lamented the tendency of his doctrines, 'for if Arcesilaüs loosens the ties of morality by his words, he knits them again by his actions.' Yet he is accused by some of carrying the pleasures of love and wine to an excess little suited to his character as a philosopher; but we think that all such accusations ought to be received with considerable caution. He was succeeded in his school by Lacydes, *s.c.* 241. The reader may consult the fourth book of Cicero's *Academic Questions* for an eloquent and masterly exposition of the arguments for and against the philosophical doctrines of Arcesilaüs and the sect which he founded.

ARCH, the same word as arc in its etymological derivation, and an older English form (having been always used in the sense of arc until that continental form superseded it), is now applied to any solid work, whether of masonry or otherwise, of which the lower part is formed into an arc of a curve supported at the two extremities. We proceed to give some idea of the question of theoretical mechanics connected with this word, referring, for all matters connected with the support, to **ABUTMENT**, **BUTTRESS**, **IMPOST**, **PIER**, and for history and general information to **BRIDGE**.

In practice, we have not only the arch itself to consider, but the loose matter with which the space above it is filled, and the roadway or building thereon constructed. The two extreme effects of this load may be thus stated. If it were fluid, the common law of hydrostatics would direct us to consider every small portion *ab* (*fig. 1*) of the arch as sustaining a pressure perpendicular to itself, equivalent to the weight of a column of fluid having the horizontal base *ab*, and the mean of *ac* and *bd* for its altitude. On the other

hand, if the whole superincumbent load could be considered as perfectly solid and wholly unsustained by lateral pressure, the portion *p q h g* might be considered as a part of the arch-stone underneath. In the absence of all trustworthy experiments to determine how far the real superincumbent pressure, where resulting from loose materials, partakes of one or the other supposition, we shall adopt the latter as probably nearer the truth than the former: which is equivalent to treating of the arch only after its superincumbent weight has been added to each arch stone.

A C and **B D** are called the piers of the arch; it is said to *spring* from **A** and **B**; **A E** and **B F** are the flanks, and **G** the *crown*. The lower line of the arch stones is called the *intrados* or *soffit*, the upper, the *extrados* or *back*; the arch-stones are called *voussoirs*, and the highest stone, **G**, the *key-stone*. **A B** is the *span* of the arch, and **G H** its *height*. The *voussoirs* are cemented together, and if the cement were sufficiently strong, any form might be given to the arch, or at least any form which would stand if cut out of the solid material. If we suppose the stones uncemented, their friction upon one another would tend to prevent the disturbance of equilibrium, and allow considerable variety of form in arches constructed with stones of the same weight. But if we suppose the stones

perfectly smooth, so that each of them is kept from slipping only by the pressure of the adjoining two, then each intrados has one particular form of extrados and one only, so long as the manner in which the stones are cut follows one given law.

Let **P Q**, **R S** (*fig. 2*) be parts of the pier, which we suppose firmly fixed, and let there be no key-stone, or suppose the key-stone divided in the middle at **A B**. Let the portion

Fig. 2.

A C D B be taken, composed of several arch-stones, and let its centre of gravity be **G**. Then the weight of **A B C D**, collected at **G**, is sustained by pressures at the surfaces **A B** and **C D**, perpendicular to those surfaces. Take **E F** in the continuation of **A B**, of any length, and draw **F H** parallel to **C D**. It is a known theorem, that any three forces which balance each other, are proportional to the three sides of a triangle, the directions of the sides of which are perpendicular to the direction of the forces. In the present case, **H E F** is such a triangle; for **H E** being horizontal is perpendicular to the direction of all weights; **F E** is the continuation of **A B**, and therefore perpendicular to the pressure at **A B**, while **F H**, being parallel to **C D**, is perpendicular to the pressure at **C D**. Hence **H E** bears to **E F** the same proportion as the weight of **A C D B** to the pressure at **A**. In the same manner it may be shown that, **F M** being parallel to **K L**, the weight of the portion **A B K L** is to the pressure at **A B** as **M E** to **E F**, from which it follows that the weight of **A K L B** bears to that of **A C D B** the proportion of **M E** to **H E**. Hence the following theorem:

Let **E F** be vertical, **E S** horizontal, and **F M**, **F N**, &c., parallel to the divisions between the *voussoirs* of an arch which is divided at its highest point; then, no friction being supposed, there can be no equilibrium unless the weights of the successive *voussoirs*, reckoned from the highest point, are to one another as **E M**, **M N**, **N P**, &c.

It is also necessary to the equilibrium that the vertical drawn through the centre of gravity **G** of the part **A C D B** should cut the parallelogram **1 2 3 4**, made by perpendiculars to **A B** and **C D** drawn from their extremities: for otherwise there would be no point in the vertical through **G** (at some part of which the weight must be supposed to act), at which the directions of the perpendicular pressures could meet, and no three forces can maintain equilibrium unless their directions pass through one point.

The application of analysis to the preceding conditions gives the common theory of arches. It may be found in most elementary works on statics; but we do not proceed further here, because, as will presently appear, nothing but a very considerable departure from the principles of it can endanger the construction of an arch. We need not therefore dwell upon this.

An arch constructed upon the preceding principles would, if the stones were perfectly smooth, be totally overturned by the least addition to, or subtraction from, the weight of any one arch-stone: for each arch-stone is only just kept in equilibrium by the pressures of the two adjoining. Such an arch, therefore, would not serve for a bridge, which must bear a considerable addition to its weight at different times.

It is to the friction and cements that the power of sustaining additional weights is due. It is evident that before the arch, kept in equilibrium as above, can be overturned, the additional pressure must be such as to overcome the friction against some one arch-stone exerted by the two adjoining. And the advantage is the greater, since the additional pressure itself increases the friction which opposes it. The effect of friction may be thus represented. First ascertain

the stone plane BC until the least additional elevation would make it slide down.

Measure the angle CBD. Now suppose PQRSTV to be part of an arch kept in equilibrium without friction. From T on both sides make the angles QTX, QTY equal to CBD above measured: then the effect of friction is this, that instead of the two arch-stones meeting in TQ, their line of junction might have been anywhere in the angle YTX, without endangering the mere equilibrium. Or if, as in a preceding figure, FM and FN are parallel to the lower sides of two arch-stones, and the angles MFX, MFX', NFX', NFX', be made equal to the angle BCD above-measured, then, instead of its being required that the proportions of the weights resting on those sides should be strictly

that of EM to EN, they may be in the proportions of any two lines, which, being set off from E towards S, have the end of the first between X and Y, and that of the second between X' and Y'. The great latitude which this gives to the construction (since BCD is, for some materials, as great as 40°) renders attention to the system of equilibrium without friction almost unnecessary, so that any arch which does not very materially differ from the arch kept in equilibrium without friction, may be considered as safe from all fracture which arises from the slipping of an arch-stone. We can find no instance mentioned of an arch which broke in this manner.

The difficulty in the way of determining the best figure of an arch, lies in our comparative ignorance of the manner in which pressure is actually communicated. The materials supposed in mechanical problems are usually perfectly rigid; those of nature are compressible: and though it is clear that a very slight alteration of form might throw the pressure of one arch-stone almost entire upon a very small part of the adjoining, we do not know enough of the nature of the materials even to guess at the law of distribution. Again, if a part of an arch be overloaded, but prevented from falling by the friction or cement, a new force, not contemplated in the preceding theory, is exerted upon the remainder. Dr. Robison, as far as we know, was the first who brought

forward this method of considering the subject. He was led to it by observing an arch which fell, the account of

which we give in his own words (*Mechanical Philosophy*, vol. i. p. 640): 'It had been built of an exceedingly soft and friable stone, and the arch-stones were too short. About a fortnight before it fell, chips were observed to be dropping off from the joints of the arch-stones, about ten feet on each side of the middle,' that is at H and F, 'and also at another place on one side the arch about twenty feet from its middle,' that is at I and G. 'The masons in the neighbourhood prognosticated its speedy downfall, and said it would separate in those places where the chips were breaking off. At length it fell: but it first split in the middle, and about fifteen or sixteen feet at each side,' that is at D and B, 'and also at the very spring of the arch,' that is at k and l. 'Immediately before the fall, a shivering or crackling noise was heard, and a great many chips dropped down from the middle between the two places from whence they had dropped a fortnight before,' that is from a and b. 'The joints opened above at these new places more than two inches, and in the middle of the arch the joints opened below, and in about five minutes after this the whole came down. Even this movement was plainly distinguishable into two parts. The crown sunk a little, and the haunches rose very sensibly, and in this state it hung for about half a minute. The arch-stones of the crown were hanging by their upper corners. When these splintered off, the whole fell down.'

The preceding method of fracture also took place in several model arches of chalk, loaded for the purpose, and Dr. Robison explains the phenomena as follows. He supposes that the pressure from the crown is communicated in a straight line along as many voussoirs as one straight line will pass through. That is, he considers each of the four parts ED, DA, AB, BC, as one separate stone, not liable to be broken. The preliminary chipping from I, H, F, and G he supposes to have arisen from the whole superincumbent pressure being there sustained at the corner of the arch-stones. When the arch opened underneath A, the whole pressure was supported at a and b, since the opening at B and D deprived the arch of the support at those points. This occasioned the chipping there observed just before the fall. We must, however, remark, that the loose manner in which the preceding account is given renders it impossible to say whether or no Dr. Robison was justified in supposing the line of communication of the pressure to be straight. His hypothesis might equally apply, if AHD were a convex curve, touching the intrados at H. This experiment should be repeated, with more attention to minute circumstances and actual measurement.

This very ingenious and probable explanation, which, supposing the slipping of individual voussoirs to be impossible, may be considered as almost unobjectionable, led its author to recommend that the arch should always be made so flat as to admit the same straight line being drawn so as to pass through some point of every voussoir on each side of the key-stone. That such an arch cannot be destroyed without either removing the pier, or crushing the material, is evident in the case of a triangular arch, *slipping being supposed impossible*, since there is no part of the arch

which exerts any effort to overturn the rest, but only to crush it. Blackfriars bridge has arches of this kind, not indeed triangular, but so flat that a straight line can be drawn through all the voussoirs in the manner recommended by Dr. Robison.

On this subject we refer the reader to Dr. Robison's work above cited, and to the article 'Bridge' in the *Encyclopædia Britannica*. For the method of building an arch, see CENTERING, to which also we must defer the account of a method of constructing arches lately invented by Mr. Brunel, in which the stones are so joined that each half of the arch supports itself independently of the other.

ARCH. The origin of that species of construction called an arch is still unknown; it cannot be stated with any degree of certainty, either in what country or at what epoch it was first used. There is good reason to think that it was unknown to the Greeks at the time when they produced

their most beautiful temples, in the fifth, fourth, and third centuries before the Christian æra. No structure answering to the true character of an arch has been found in any part of those works, though many occasions occur in which the application of the arch would have been of great service, and could not have been passed over by an intelligent and ingenious people like the Greeks, if they had been acquainted with the principle. The want of the arch would necessarily lead them to contract the intercolumniation, or spaces between the columns, and to the general and frequent adoption of columns as the only mode of supporting a superstructure. That the Greeks, before the time of Alexander, and perhaps even at a somewhat later epoch, were not acquainted with that mode of arranging materials upon which arching depends, might perhaps be considered sufficient evidence that it was unknown in Asia and Africa, even if the Indian, Egyptian, and other monuments of early date did not prove the same thing. If these nations had known this admirable expedient they would doubtless have applied it in many instances in which it is obvious that it would have been of the greatest use; and if it had been used in Egypt, it could hardly have remained unknown to those nations who were in the habit of trading with the Egyptians. We know that both the European and the Asiatic Greeks had commercial factories in Egypt, even in the reign of Amasis. Herod. ii. 178.) [See AMASIS.]

It is maintained, however, by some, that there are brick-arches at Thebes in Egypt, which belong to a very remote epoch, and one long prior to the Greek occupation of that country. Minutoli (*Reise zum Tempel des Jupiter Ammon*) has given two specimens of Egyptian arches, one of which is a false and the other a true arch. The first specimen is from the remains at Abydos in Egypt (p. 245), where the roof has the appearance of an arch, but is formed by three horizontal stones, of which that which occupies the centre and lies over the other two, is the largest; the three stones are cut under in such a way as to form a semicircle. The true specimens are at Thebes, on the west side of the river (p. 260), near and behind the building which contains the fragments of the enormous statue. They are circular arches, and formed of four courses of bricks (see pl. 29), and on the walls there are Egyptian paintings and hieroglyphics. (See also Belzoni's *Plates*, No. 44, and his remarks on the brick arches of Thebes.) Should these be admitted to be old Egyptian arches, it seems difficult to conceive why the arch should not have come into more general and early use. The stone arches in the Nubian pyramids can hardly be adduced in proof of the origin of the arch, as these edifices are probably not of very high antiquity. (See Cailliaud's *Plates*, No. 43.) Etruria seems, from the best evidence that can be obtained, to have been the birth-place of the arch, and to the Etrurians, with great probability, may be assigned the honour of the invention, and certainly that of its earliest applications, as far as our positive and undisputed information goes. The great sewer of Rome, commonly called the Cloaca Maxima, is an arched construction, which can hardly be referred to any period in the history of the city with so much probability as to that to which it is assigned by uniform tradition, namely, the age of the Tarquins. But though we may readily admit this early date, we cannot say who were the architects, whether they were Roman or Etrurian.

The application of the arched structure is one of the most useful mechanical contrivances ever discovered by man. By means of it small masses of burnt clay, and conveniently sized pieces of soft and friable sandstone, are made more extensively useful for the economic purposes of building, than the most costly and promising materials were in the hands of the Greeks and Egyptians. By means of it cellars are vaulted; subways, or sewers, are made to pass under heavy structures and along streets with certainty and safety; and secure and permanent road-ways for every purpose of communication are formed across wide, deep, and rapid rivers.

Extensively as they made use of the arch, the Romans did not deviate much from the semi-circular form. Arches of smaller segments were certainly used by them, as well as elliptical arches, but in these cases they were fortified with enormous abutments, which proves that the architects, who probably in nearly all cases were Greeks, knew very well the weak points of such a construction. It was reserved for the architects of the middle ages, or rather those of the twelfth, thirteenth, and fourteenth centuries, to show what could be done by varying the form and construction of the arch.

The pointed arch, upon its invention or first introduction into Europe, seems to have exercised the ingenuity of architects in varying its form and application. This we observe in the numerous ecclesiastical structures in this country, in our beautiful pointed styles, and most particularly in some of the greater churches and cathedrals.

The origin of the pointed arch has been almost as much disputed as the discovery of the principle of the arch itself. It became general in most parts of Europe at nearly the same time, and about the period of the return of the warrior-priests and pilgrim-soldiers of the first crusade. This, and other circumstances which might be adduced, added to the tolerably well ascertained fact of the pointed arch being used in Asia before that period, and that an arch of the pointed form cannot be satisfactorily shown to have been used at all in the northern and western parts of Europe anterior to it, give, in the opinion of some people, a reasonable degree of certainty to the supposition that the notion was brought from the east by the crusaders. Its origin may be this:—Before arching was understood, or its principle known, the use of long lintel stones was sometimes avoided, and, indeed, a trifling degree of strength was gained, by jutting stones over from each side of an opening in three or four courses until

they nearly met in the middle then a stone of common size and ordinary length only was required to close in at the top, instead of a long and large one to serve as a lintel. The projecting lower angles of the stones, which corbelled or battered over, were disagreeable to the eye, and might also be inconvenient; and therefore they would be generally cut off, as indicated by the dotted lines, leaving the head in the form of a pointed arch. Such an explanation is, however, far from satisfactory; and it appears to us that the following extract from Mr. Rickman (*An attempt to discriminate the Styles of English Architecture*, by Thomas Rickman) contains a more probable solution of the difficulty, at least as far as concerns the origin of the pointed arch in early English buildings.

“Intersecting arches were most likely an early, and certainly a very widely-spread mode of embellishing Norman buildings, and some of them were constructed in places and with stones requiring centres to turn them on, and the construction of these centres must have been by something equivalent to compasses. Thus, even supposing (which could hardly have been the case) that the arches were constructed without a previous delineation, the centres would have led to the construction of the pointed arch; and when once formed, its superior lightness and applicability would be easily observed. To this remark it may be added, that the arches necessarily arising in some parts from Norman groining, would be pointed. A careful examination of a great number of Norman buildings will also lead to this conclusion, that the style was constantly assuming a lighter character, and that the gradation is so gentle into early English, that it is difficult in some buildings to class them, so much have they of both styles: the same may be said of every advance; and this seems to be a convincing proof that the styles were the product of the gradual operation of a general improvement guided by the hand of genius, and not a foreign importation.”

We propose to treat of the various forms and decorations of the arch under the several divisions indicated in the article ARCHITECTURE.

ARCH, TRIUMPHAL, a structure which the Romans used to erect across their roads, or bridges, or at the entrance of their cities, in honour of victorious generals or emperors. They were of two kinds; temporary arches made of wood, on the occasion of a triumph, when the procession passed under the arch, and the conqueror had the triumphal crown placed on his head. These arches were removed after the ceremony. The others were permanent structures, built first of brick, afterwards of hewn stone, and lastly made of, or at least cased with, marble. Their general form is that of a parallelopipedon, which has an opening in the longer side, and sometimes a smaller opening on each side of the large one. These openings are arched over with semicircular arches, and the fronts are decorated with columns and their accessories on lofty pedestals the whole

is surmounted by a heavy attic, on the faces of which inscriptions were generally placed.

Triumphal arches were erected under the Republic. An arch of P. Cor. Scipio Africanus (Liv. xxxvii. 3.) is mentioned as having been built on the Clivus Capitolinus. (See also Liv. xxxiii. 27, on the arches of L. Stertinus.) The Fabian arch is mentioned by Cicero (*Pro Plancio*) under the name of 'Fabianus fornix': it stood by the Via Sacra, near the spot afterwards occupied by the temple of Antoninus and Faustina. It was raised in honour of Fabius, surnamed Allobrogus from his victory over the Allobroges. This arch is also mentioned by Seneca, who calls it 'Fabianus arcus.' The term used by Dion Cassius for a triumphal arch is ἀνίκητος τροπαῖον. The arches of Stertinus and Scipio were ornamented with gilded statues; and that of Scipio with two horses also. Whether they precisely resembled the later arches as to their columns, relieves, and other accessory parts, we cannot say. As far as we can judge from medals, these early triumphal arches consisted of a single arch with a column on each side, without a stylobate; the arch was surmounted by a simple border as a kind of architrave.

Under the emperors these monuments became very numerous, and were overcharged with ornaments. Drusus, the stepson of Augustus, is mentioned as the first who had one raised to him after death, and Livia, the wife of Augustus, was the first woman to whom a similar honour was decreed. Augustus himself had several triumphal arches erected to him, of which the one at Rimini, where the Flaminian Way terminated, still remains, and serves as a gate to the town on the side towards Rome. Another arch, also erected to Augustus, though inferior in beauty to that of Rimini, exists at Susa, at the commencement of the road which leads over Mont Genève into France. Of the triumphal arches remain-

ing at Rome, that of Titus is the oldest. It was erected to him after his death by the senate in memory of his conquest of Judæa. This arch is ornamented with sculptures representing the triumph of the conqueror, and with the ornaments of the temple of Jerusalem which he brought as spoils to Rome. But arches were not erected solely to commemorate victories and conquests; they were also raised in honour of emperors for benefits conferred on their country on some particular occasions: such is the fine arch of Trajan on the old mole of Ancona. It is of white marble, and chaste in its style; the inscription states that it was raised 'by the senate and people of Rome to Trajan, Emperor and Cæsar, son of Nerva, the conqueror of the Germans and Dacians, high pontiff, &c., a most provident prince, for having at his own expense constructed the mole, and thus rendered the access to Italy on this side safer to navigators.'

Bronze statues of Trajan, of his wife Plotina, and his sister Marciana, were placed on the summit of the arch, but they have been destroyed. Another fine arch in memory of

[Arch of Constantine.]

Trajan exists at Benevento; it is ornamented with fine relieves, and is in very good preservation. All these are single arches; but others have two smaller archways, one on each side of the great central one. These are consequently oblong in their shape, and have a heavier appearance than the single arch. Two of these triple arches still exist at

Rome, that of Septimius Severus, and that called the arch of Constantine, which we have chosen for our illustration. The view here given is from an original drawing. The arch of Constantine is in the valley at the foot of the Palatine Hill, and near the Colosseum. It is the most complete of all the triumphal arches at Rome: that of Titus has

only a central archway, and that of Septimius Severus is more dilapidated, and more encumbered by accumulations of soil. The style of Constantine's arch is also, for the most part, superior to that of the age in which it was executed, as it consists, in great measure, of the materials of a similar monument which had been erected to Trajan. But at the same time, owing to its being chiefly built of old materials, and owing to want of skill in the architect and sculptor, it presents some striking discrepancies of parts, and some specimens of bad taste. The captive Parthians, and other sculptures, which were historically appropriate on the arch of Trajan, are here employed to decorate that of Constantine. Our view indicates an excavation, bounded by a wall of an elliptical form, within which the monument stands. Accumulations of soil had raised the level of the ground nearly up to the bases of the columns; the excavation was made for the purpose of clearing away the rubbish, and the wall with the view of protecting the monument.

The number of marble arches, in honour of emperors and other personages, existing in ancient Rome alone, is stated to have been at one time thirty-six: only five or six are now remaining. Other arches are found in various parts of Italy, at Aquino, Aosta, Pola in Istria, &c.; several in the south of France, of which those of Nismes and Orange are the best preserved; several in Macedonia, at Athens, and in other parts of Greece, all however belonging to the Roman period; several in Syria, and in Barbary, particularly one at Tripoli; and another at Constantina, described by Shaw. In modern times, triumphal arches have been raised in imitation of the Roman ones. Those of the gate St. Denis and the gate St. Martin at Paris were raised in honour of Louis XIV. Bonaparte also had one constructed on the Place du Carrousel; it is a triple arch, and has all the heaviness of that particular species of structure. Another, and a much finer one, was begun by his order at Milan, on the opening of the famous road across the Simplon. It was interrupted by the overthrow of the French empire, but has since been continued by order of the Austrian government, under the appellation of the Arch of Peace. It is now nearly finished. In London, two structures of the same kind have been raised of late years, a single arch at Hyde Park Corner, and a triple one in front of the Pimlico palace. On Roman triumphal arches the reader may consult Pitiscus, *Lexicon Antiquitatum Romanorum*, art. Arcus.

The arch of Augustus at Rimini is sixty feet in height and twenty-seven in depth or thickness; the gateway is thirty-one feet, being the widest opening among all the ancient arches in Italy. The front is decorated with two Corinthian columns thirty-two feet high. It is made of Istrian marble.

The arch of Septimius Severus is sixty-one feet high, seventy-one feet long, and twenty-two feet deep. The central archway is thirty-six feet high, and twenty-two feet wide. The side arches are twenty-two feet high and ten wide.

The arch of Orange, in the south of France, supposed, but upon no certain grounds, to have been erected in honour of Caius Marius, is seventy feet high and sixty-six long. It is a triple arch.

ARCHANGEL, or properly ARKHANGELSKOE, 'the land of the archangel,' was one of the three roots from which the gigantic empire of all the Russias has sprung.

Great is our land, and rich in fruits; but there reigns no order in it. Come, then, be princes unto us, and hold dominion over us.' At this summons from the Slavonians of Nowgorod, Rurik, Sineus, and Truvor, three brothers, chieftains of note among the warlike Warages, or Waragie-Russians, with whom both Normans and Anglo-Saxons claim kinship, descended from the Gulf of Bothnia, and divided the sovereignty of their adopted country among them. Rurik selected Nowgorod for his residence; Truvor established himself at Isbörsk; and Sineus, receiving the northernmost lands for his share, took up his quarters at Bielo-O'sero, or 'the White Lake.' The two younger brothers having died within two years after their arrival, Rurik, the survivor, in 864 became sole ruler over the three states, and the founder of a new empire, which is known among northern writers by the name of the 'Holmgard Empire.' Archangel is no less celebrated, in the description given by Alfred the Great of the Scandinavian nations, as the seat of the extensive empire of Biarmia (or Permia), which rose at the mouth of the Dwina, and spread across the countries which range between that stream

and the sources of the Volga. Tradition reports, that even in those early times navigators were accustomed to sail round the coasts of Norway in quest of the produce of Biarmia.

The province of Archangel is now one of the nineteen provinces, or governments, which constitute that portion of the Russian dominions called 'Great Russia;' and is not only the most northern but the most extensive province of Russia in Europe. It comprehends part of ancient Biarmia, Russian Lapland, the range of country inhabited by the Wainotan branch of the European Samoiedes, Nowaia Zemlya, or Nova-Zembla, and other islands in the Icy Ocean. Its most eastern limit is about 66° E. long., and its most western 29° 54'; its southernmost point is in 61° 10' N. lat., and its most northern limit extends to lat. 76°, the extreme point of Nova Zembla. The superficial extent of this province is variously estimated; by some writers at two hundred, by others at two hundred and seventy, and by more than one even at three hundred and fifty thousand square miles. Including the 27,000 miles contained in the recent addition of the circle of Kem, we conceive that its superficial extent may be safely set down at upwards of 300,000 square miles. In this respect, therefore, it exceeds the superficial area of the whole of the Austrian dominions, and is more than three times as large as Great Britain. But its population does not exceed 280,000 souls at the utmost, or about one to a square mile. Its continental limits are the government of Tobolsk on the north-east and east, Wologda on the south and south-east, Olonetz on the south-west, and Finland on the north-west; its northern shores are washed by the Icy Ocean, and the great gulf of the White Sea. The northern part of the main land in this province is situated within the Frigid Zone, and presents as desolate and sterile an aspect as the eye can dwell upon: this is particularly the case towards the east, where an immense tract of black soil, covered with moss and crusted with ice for nine months in the year, is better known among the natives by the name of the 'Tundri.' It stretches 150 miles into the country from the seacoast; and except its mossy coat, a little sorrel, and an occasional handful of berries, exhibits few signs of vegetation. South of the Tundri lie forests of pines, birches, alders, and willows. The land in the north abounds in lakes and swamps, and is traversed by several rivers, but is not capable of cultivation; the westernmost part of it only, formerly called Russian Lapland, produces here and there a few cabbages, turnips, and other sorts of vegetables, as well as berries. Even that portion of the province, which lies most to the south, affords but a scanty and precarious return to the husbandman; though in proportion as we leave the northern regions, vegetation becomes more vigorous, and grass and extensive forests show themselves. The province is in general a continuous flat, particularly that part of it which lies to the west, between the frontiers of Finland and the river Mezen: the only exception arises from the course of the Scandinavian range of mountains through the circle of Kem and Lapland; it is in this direction that they terminate in the promontories of Orlov on the White Sea, and Swiatoi Noss or 'Holy Point' on the Icy Ocean. In the eastern parts of the province two ridges encircle the bay of Tsheskaï, the westerly branch of which ends at Cape Kanin: these are independent of the low chain of hills which crosses the steppe of Tundri, and rising at a distance of seventy miles from the banks of the Petschora, takes a north-easterly course, and joins the Ural, from which point the latter forms the boundary between Archangel and Siberia. This portion of the Ural range is called 'the desert Ural.'

The great river of the province is the Dwina, or 'the double river.' In its upper course from Lake Kubinskoi, it bears the name of 'Sukhona,' which it retains north-eastwards as far as Ustyug-Weliki; there it receives the name of the 'Jug,' or Upper Dwina, and afterwards that of the Dwina. It abounds with fish, and is navigable for 300 miles and upwards to the frontier of the province of Wologda; it widens to a breadth of nearly five miles at the town of Archangel, whence it flows by three channels into the White Sea. [See DWINA.] The Sukhona communicates with the Neva and Volga by means of the Kubinskoi canal and the lake of Bielo Osero. The Onega, whose whole length is nearly 400 miles, is likewise a navigable stream of some consequence; it enters the province from the adjoining government of Olonetz, and flows into a bay of the White Sea studded with islands. The same sea, west of Archangel bay, also receives the Panoi, the longest river in Lapland; and

the Mezen, a considerable stream, which rises in the marshes of the steppe of Petshora, and flows in a north-westerly direction for nearly 500 miles. The Petshora rises in the Ural mountains, ranges over a distance of full 700 miles of dreary waste, and, before it crosses the boundary between the provinces of Wologda and Archangel, receives the Usa and Elma, and then enters the sea, between Capes Bolvanski and Kostianoi, where its surface is spotted with islands: it is navigable immediately after quitting the Ural mountains, but is locked up by ice for nine months in the year; its dreary banks are rarely the resort even of the hardy Samoiede.

The province of Archangel abounds in lakes, separated by sterile rocks, in almost countless numbers; the most considerable lie in that part of it which is situated immediately north and west of the White Sea. Amongst these are the Imandra, Kowda, Toposero, Angosero, and upper and lower Koutno.

The climate of this province, particularly the northern districts, partakes both of the extremes of heat and cold. The heat of the summer season is often oppressive; and the transition from heat to cold, on a change of wind, is frequently so instantaneous, that a man who has been working in his shirt is forced to have immediate recourse to his fur-cloak. But the climate becomes more intensely severe in proportion as we advance eastward. Every river between the Mezen and Petshora is frozen up by the end of September or beginning of October; the Dwina, on the other hand, does not usually close until a month later, and is again free from ice by the end of April or the first week in May. In those parts which lie between the Petshora and Siberia, the Samoiede himself yields to the inclement cold: no stream is open until June, and scarcely one is free from ice by the middle of September. Spring, summer, and autumn are thus reduced to an interval of three months.

The northern districts of Archangel are wholly uncultivable, and its soil, even in the south, does not yield grain enough even for the support of its scanty population. The bread in use is a compound of meal, moss, scrapings of the bark of the pine, and grated roots; yet this food, coarse as it is, is unknown to more northern palates, which must be content with dried fish. The southern districts grow hemp and flax, and a few kinds of vegetables; and in some parts, on each side of the Dwina more especially, there is pasture ground of good quality. But Archangel contains a still unexhausted mine of wealth in its forests, which give profitable employ to the labourer, the artisan, boatman, mariner, shipwright, merchant, and even the more humble gleaner of the berries which grow beneath their shade. The predominant species of timber are fir, pines, birches, alders, and larches, which are of great dimensions and lofty growth. These forests are the resort of a variety of wild animals, which the natives turn to good account. In the Tundri and sea-coast are the bear, wolf, rein-deer, squirrel, ermine, hare, martin, glutton, fox (both the common species and the beautiful polar-fox), wild duck and goose, swan, water-hen, and eider-fowl. To these may be added an abundance of marine animals, in pursuit of which hunting parties resort to Nova Zembla in particular, where they build cabins with the wood they have brought with them, and pass the winter, employing themselves in catching seals, sea-cows, and morse, or in hunting the polar-bear, fox, or rein-deer. The seas, lakes, and rivers of Archangel furnish food to the inhabitants from their ample store of whittings, pikes, eels, salmon, perches, and other fish. The only domestic companion of the Laplander and Samoiede is the rein-deer; their stock of this invaluable animal forms the criterion of wealth; hence the individual who has two thousand is accounted rich, but the man is poor who cannot muster more than thirty or forty. Archangel is but slenderly supplied with horses and cattle, and they are in general of diminutive size: the districts of Kolmogory and Shenkursk, however, which are rich in pastures, have formed an exception ever since the time of Peter the Great, when a handsome race of oxen, which have no way degenerated, were imported from Holland by that monarch: the calves of this species are kept warm, and fed on milk for nine months; at this age they weigh sometimes as much as six or eight hundred pounds, and are so white and delicate in flesh, that they are sent to St. Petersburg, where they fetch uncommonly high prices. Neither sheep, swine, nor goats are bred in any considerable numbers; what little mutton is eaten is of indifferent quality, and the fleece

is fitted only for making the coarse cloth termed wadmal. The country is also so well-stocked with game, that scarcely any poultry beyond the cock and hen are kept. With regard to minerals, salt is the staple product of this province: it is obtained in various quarters, particularly in the neighbourhood of Totma, and from the waters of the Kouda and Lengsa by the process of boiling. Bog-iron is found in considerable abundance, and between 700 and 800 tons of it are exported annually.

The manufacturing and mechanical industry of the people is principally confined to ship-building, the preparation of pitch and tar, and the weaving of linen, which latter occupation fills up the leisure hours of the peasant's wife in the circles of Kolmogory and Archangel, and constitutes a lucrative branch of their commerce with St. Petersburg, Moscow, and other Russian marts. In some years, 3000 tons of pitch have been boiled down, and 13,000 barrels of it exported; whilst the ports of the White Sea have despatched tar to the extent of 25,000*l.* in value to foreign parts. There are four refineries for sugar in the province, and seven rope-manufactories, but only three of them can be said to be of any importance. From 400,000 to 500,000 deals are often exported from the capital in a single twelvemonth. Tallow also is shipped in very large quantities from the White Sea, sometimes to the extent of 2500 tons and upwards yearly; but the bulk of this article is brought down from the adjacent provinces. The less important productions of Archangel which find their way outwards, are train-oil, hemp, flax, mats, canvas, skins, and furs.

The majority of the population of Archangel is of Russian extraction, in the proportion of ninety-five out of every hundred souls; the remaining portion consists of about 7000 Samoiedes, 6000 Syriaenese (or Siriani, a Samoiede race, who inhabit the districts lying around the upper banks of the Petshora), and 1700 Laplanders, besides a few Fins, who are domesticated in the circles of Kem and Kola. The tenets of the Greek faith are professed by all but a few thousand pagans, amongst whom the forcible conversion directed by an ukase of the year 1825 has, we trust, been as successful in respect of their religious convictions, as it has been of their numbers; for within five years from the sending out of the missionaries three churches were built for the use of the 3500 heathens who had been prevailed upon to embrace Christianity. These converts consist almost exclusively of the Samoiede hordes who inhabit that part of the province of Archangel which stretches from the Mezen to the frontiers of Siberia,—a tract of country than which Russia in Europe does not contain a colder, wilder, or more inhospitable climate. This uncivilized race of beings, whose name implies 'eaters of one another,' though there is no trace whatever of their having deserved to be branded as cannibals, originally migrated from Siberia; but they are not the primitive inhabitants of the soil; for the ruins of whole lines of ancient dwellings, which are found on the banks of lakes and rivers, show that the Samoiede was by no means the first occupant of this country. The name has been in use among the Russians ever since the eleventh century; but the Samoiede himself admits no other than that of Chasowa, signifying, in his own language, 'man.' He is of middling stature, has a broad, flat, round face, brownish-yellow complexion, small black eye, black hair and eyebrows, and but a slender beard,—in every respect the counterpart of his Asiatic brethren, who are far more numerous in the north of Siberia, where there are upwards of 60,000 of them. The dialect of the European Samoiede is poor and imperfect, and spoken by no stranger but a few Cossack dealers; the use of written characters is unknown among them. They seldom attain to a greater age than sixty or seventy, lead a wandering life, and, with the assistance of their rein-deer, shift their encampment as inclination or necessity prompts them. They live by breeding that animal, catching fish, and following the chase; which enables them to discharge their annual 'Jassak,' or tribute of furs and hides, to the Russian crown. This is fixed at three foxes' skins for every Samoiede who carries bow and quiver; and is collected by the oldest among them, who must make their appearance at Mezen in the months of December or January, and deliver the yearly quota to the Russian authorities. What they succeed in collecting for their individual benefit is sold to the travelling Russian dealer, or carried to the open markets in the adjacent provinces. Indeed they are frequently known to transport their merchandise 500 miles and upwards for a sale; many

of them resorting to so distant a spot as Obdorsk in the month of February, where they exchange their wares for Russian bread. Erman, indeed, tells us that they will at times trace the immense distance of 1500 miles, which lies between Archangel and Turnkhansk on the Jenisei, from mere fondness for shifting their quarters. [For further details, see the article SAMOIEDES.]

Archangel consists of eight circles, namely, the city and dependencies of Archangel, Kholmogory, Shenkursk, Pinega, Onega, Kem, and Mezen. Independently of Archangel itself, the circle of that name contains Nowa-Dwinkaia-Krepost, a fortress, about ten miles distant from the capital, on an island of the Dwina, the entrance of which it defends; close upon the ramparts is a town of about two hundred houses, which are mostly used as stores by the merchants of Archangel. The island of Soloweski, in the White Sea, is also within the limits of this circle: it is the largest of a cluster lying about 150 miles N.W. of Archangel, and, besides a monastery, to which numbers of pilgrims resort, contains a borough town, the inhabitants of which prepare a peculiarly pure description of isinglass, considered by some to be the finest that Russia produces. The chief town in the circle of Kholmogory bears the same name, and is situated on an island in the Dwina, thirty-five miles south of Archangel: it has a building-yard for ships, and a school for navigation: its environs afford pasturage for the finest breed of cattle in this quarter of the world. The population scarcely exceeds 500 souls. Shenkursk is the capital of the circle so called, and lies on the Waga, about 170 miles S.E. of Archangel: it is said to have been inhabited by the Tshudes, who are supposed to have been a Finnic race, before the Russians settled in the country; and the remains of a fort, built by them, are still to be seen on an adjacent eminence. In the circle of Pinega is the inconsiderable town of the same name, on the banks of the Pinega, which flows into the Dwina. The chief town in the circle of Onega bears the same appellation, and is situated at the mouth of the Onega, which runs into the bay of that name in the White Sea. It lies about 80 miles S.W. of Archangel, and possesses a good harbour, is engaged in ship-building, and exports timber, tar, and pitch. The number of its inhabitants is about 2000. Kem, the capital of the circle of that name, which once formed part of the province of Olonetz, and has latterly been incorporated with that of Archangel, is a small town with a harbour, not far from the afflux of the Kem into the White Sea. Kola, or Kolkoi-Ostrog, the principal place in Russian Lapland, in 32° 30' E. long. 68° 20' N. lat., is the northernmost town of Russia in Europe, and next to Wardöe, a port on a promontory in eastern Finmark in Norway, which lies in 31° 7' 30" E. long. 70° 22' 36" N. lat., and to Hammerfest, which is on an island likewise on the Norwegian coast, (70° 38' N. lat. 23° 49' E. long.) is the northernmost town in Europe: it is situated close upon an arm of the White Sea, between two rivers, the Tuloma and Kola, and possesses a harbour formed by the mouth of the latter stream. Its inhabitants, in number about 1200, are employed in catching walruses, cod, and whales, and traffic in furs and hides. There is a copper-mine in its vicinity, and at the extremity of the gulf is the port of Ekaterina. Kola is about 630 miles north of St. Petersburg. It should here be observed, that the Fälld districts, formerly belonging to Norway, have constituted a portion of Russian Lapland, by virtue of the frontier treaty concluded between Russia and Sweden, ever since the year 1826. Part of the river Pasvig, and the Jacob's Elve, now separate Swedish from Russian Lapland. Neiden and Peise, two places within the latter, are the resort of the native traders. The capital of the circle of Mezen, as well as the chief town in the territory of the European Samoiedes, bears the same name as the circle, and lies on the river Mezen, twenty-eight miles from the Icy Ocean, where it forms a harbour: it is inhabited wholly by Russians, who make excursions on an extensive scale to Spitzbergen and the islands of Kalguiew and Nova-Zembla, and bring back with them the produce of their toils by land and sea, in such quantities as to give rise to considerable traffic. It is about 140 miles E.N.E. of Archangel. The other spots deserving of notice in the land of the European Samoiedes are Pust-Osersk, the central point of their dealings, which lies on a lake of the same name connected with the Petshora, consists of about fifty houses, and has seventeen villages dependent upon it: this place is resorted to even by the fur-dealers of Wologda,

St. Petersburg, and Moscow, who reach it in October and November, and leave it shortly before Christmas. The natives breed rein-deer in such large numbers that many of them possess herds of 1000 each. Pust-Osersk is about 150 miles to the N.E. of Mezen, and lies on a lake near the mouth of the Petshora. About 140 miles eastwards of Pust-Osersk lies Ust-Zülma, on the right bank of the Petshora; it contains 120 houses, and has four villages within its district: besides rearing rein-deer and raising barley, the inhabitants deal largely with the Russian traders in furs and the produce of their fisheries. And about sixty miles farther onwards stands Ishma (or Ishemakaja-Slobodka) on the banks of the Ishma; it consists of sixty-four houses, and has several villages within its jurisdiction. Rye and barley are cultivated near this spot; the natives breed considerable numbers of rein-deer, and carry on a thriving trade in furs, tallow, butter, and dried fish.

The islands of Kalguiew, Warandei, Waigatz, Nova-Zembla, and Tshorni, which are the chief among the insular dependencies of the province of Archangel, will be noticed under their respective heads.

ARCHANGEL (known amongst the Russians by the name of *Gorod Arkhangel'skoi*, or town of the convent of 'St. Michael' the archangel) is the capital of the province of Archangel, and the most northern emporium of trade in the Russian dominions. Its site is a low flat; it extends about two miles along the right bank of the Dwina, and is forty miles from the mouth of that river. It is not accessible to vessels of heavy burthen, owing to the shallowness of the stream and a bar which runs across it, with only twelve feet of water, about five miles below the town. Archangel is the oldest port in the Russian dominions: in the eyes of our own countrymen, however, no circumstance can render it an object of greater interest than its celebrity in the annals of British enterprise. The discovery of a passage to the coasts of the White Sea has been truly said to have formed an epoch in the history of commerce; for it gave an entirely new direction to the trade of the north. This took place in 1553, when Richard Chancellor, the commander of a vessel which was despatched, in company with two others, to find out a north-eastern passage to China, navigated the White Sea and sailed up the bight of St. Nicholas, into which the Dwina pours its waters. From this point he made his way to the court of Ivan II., who, being thus convinced of the practicability of navigating seas hitherto deemed inaccessible to the mariner, gave directions shortly afterwards for building the port of Archangel, which was commenced by Nashtshokin, the woiwode of those parts, in the year 1584, upon a spot previously selected as a home-stead by the members of a religious establishment. Russia at this time possessed no ports on the Baltic; and, indeed, for a long period subsequent, no other port but Archangel in its whole dominions. It is now become the chief mart of its northern trade, as it was, in its early days, the centre of all traffic between Muscovy and foreign parts. The benefit of the discovery, after it had been for some time confined to our own countrymen, was afterwards shared with the Dutch and Hamburgese. Archangel is mentioned in the travels of the Holstein ambassadors to Muscovy and Persia, as a considerable port in 1636; it is remarked, that from 300 to 400 ships, principally English and Dutch, were sometimes seen in the port. (Olearius, *Voyage de Moscovie*, p. 159.) The prosperity of the port received however a shock from the establishment of St. Petersburg, from which it did not recover till the Empress Elizabeth placed its immunities on a level with those of the metropolis in the year 1762. It has since been increasing gradually in importance. During the hundred years which preceded 1827, the exportations of Archangel did not amount to more than 23,350,000*l.*, or, on an average, 233,500*l.* a-year: whereas, in 1829, they were to the extent of 562,000*l.* In that year, too, the number of vessels which entered was 412; being an excess of 95 over the return for 1825. Its trade has been improved of late years by the opening of a communication by canal with Moscow and Astrachan. The bulk of its shipments still consists, however, of the growth and manufacture of Siberia, and more northerly latitudes; such as fish, fish oils, tallow, candles, timber wrought and unwrought, pitch, tar, wax, iron, linseed, furs, hides, bristles, caviar, &c. When the navigation of Archangel is open, the river, from the roadstead to the town, is covered with vessels and boats of all sizes; the quays and shores are

peopled with multitudes, variously and actively employed; and the great road from Siberia is covered with travellers and loaded carts and waggons. Archangel does not contain above 2000 houses, and its inhabitants do not exceed 15,000: in both respects it stands much on a par with Berwick-upon-Tweed. Mixed with the native-born subjects of Russia are a few Englishmen, Dutchmen, and Germans, who are, almost without exception, merchants or mechanics. In a manufacturing point of view, Archangel is of minor importance: there are some sugar-refineries, and manufactories of canvas and cordage; there is also much ship and boat building going on; and eleven miles below the town lies the government yard, with three slips for building ships of war. This establishment is protected by the lines of Nowadwinka, which command the entrance into the Dwina, and afford security to the property of the Archangel merchants, which is deposited in the adjacent storehouses. The females employ themselves in spinning yarn, and making a coarse sort of linen, both of which are in much request in the interior of Russia. The houses are almost universally constructed of wood, the external covering being laid horizontally, and, in some instances, doubly covered, and coloured outside: most of them are two stories high; they form a comfortable residence, and, when inhabited by the wealthier class, are provided with every species of convenience, and indeed luxury. The most striking of the stone edifices is the Gostinnoi-Dwor (caravansera, or court of the trading guests), an extensive mart for the exhibition and sale of goods, which is surrounded by high walls, with six large towers, and a ditch. The churches are eleven in number; ten for the Greek and one for the Protestant form of worship; but most of them are built of wood, and the Greek churches gorgeously decorated within. The marine hospital is a building of some extent, and open to foreign as well as native seamen. But its greatest ornament is a number of open spaces, on which the merchants and dealers erect their stalls: here all articles of the same class are ranged in successive rows, and they are of almost endless variety. There are several schools in the town, at the head of which are a seminary for ecclesiastics, a gymnasium, and academies for teaching navigation and engineering. Upon the whole, Archangel is an ill-built place; the two main streets run in a zigzag direction parallel with the Dwina, and are connected by narrow lanes; they are moderately broad, and kept tolerably clean, but, instead of pavement, are floored with timber in a rough state. Its supplies of provisions are brought from a distance, as the soil in the neighbourhood grows no grain or vegetables, and breeds no cattle; this is a consequence of its position—close upon the line at which the growth of corn and fruit ceases; this line being, near the mouth of the Dwina, under the 65th degree of latitude. An association was formed at Archangel in the year 1803, under the title of the 'White Sea Company'; it despatches a fleet of vessels every year on fishery expeditions to the coasts of Nova Zembla, Kalguiew, and Spitzbergen, at the last of which the crews frequently winter. Here they contrive to maintain themselves without much difficulty by the chase, but they depend, both for their rude wintry dwellings and their fuel, on the timber thrown up by the ocean. Archangel is the seat of an archbishopric, and the residence both of a civil and military governor. The neighbouring island of Solombalsk, which is formed by the Kushenida, contains an admiralty and marine-barracks. Archangel lies in 64° 32' N. lat., and 40° 33' E. long., or about 400 miles N.E. of St. Petersburg.

ARCHÆOLOGY, literally 'the study of antiquity or ancient things,' from *ἀρχαῖος*, *antient*, and *λόγος*, *a discourse*. Though the term is often used, its meaning in this country has not always been very exactly fixed; but there is nothing properly belonging to it which is not included under the heads of **ANTIQUITY** and **ANTIQUITIES**. In general, the term *archæology* is confined to the study of Greek and Roman art, but it is sometimes used to express generally the study of all that concerns the early history of any nation or country. The divisions of the subject are consequently very numerous, and the chief works on each will be noticed under their respective heads, such as **EGYPT**, **GREECE**, **MEDALS**, **SCULPTURE**, &c.

The great extension which the study of *archæology* has received of late years, and is still receiving, seems to require now more than ever the united exertions of all who devote themselves to it. In this point of view, the *Archæological*

Institute of Rome, founded in 1829, seems likely to be of great utility. (See *Thatsachen des Archæologischen Instituts in Rom*. Von Dr. Eduard Gerhard, 1832.)

ARCHBISHOP. For what belongs to the episcopal character and office generally, we refer to the word **BISHOP**: we mean to confine ourselves in this article to what belongs more peculiarly to the archbishop. For though, in this country, and generally throughout Europe, the archbishop has his own diocese in which he exercises ordinary episcopal functions like any other bishop in his diocese, yet he has a distinct character, having an admitted superiority and a certain jurisdiction over the bishops in his province, who are sometimes called his suffragans, together with some peculiar privileges. This superiority is indicated in the name. The word or syllable *arch* is the Greek element *αρχ*, (which occurs in *ἀρχή*, *ἀρχός*, *ἀρχων*, &c.) and denotes precedence or authority. It is used extensively throughout ecclesiastical nomenclature, as may be seen in *Du Cange's Glossary*, where there are the names of many ecclesiastical officers into whose designations this word enters, who were either never introduced into the English church, or have long ceased to exist. Exalted officers of state have sometimes designations into which this word enters, as *arch-duke*. Why this word was used peculiarly in ecclesiastical affairs rather than any other term denoting superiority, is probably to be explained by the fact that the term *ἀρχιεπίσκοπος*, for chief-priest, occurs in the Greek text of the Christian Scriptures. *Patri-arch* is a less obvious compound of the same class, denoting the chief-father; and is used in ecclesiastical nomenclature to denote a bishop who has authority not only over other bishops, but over the whole collected bishops of divers kingdoms or states; it is analogous in signification to the word *pope* (*papa*), a bishop to whom this extended superintendence is attributed.

Whatever might be the precise functions of the *episcopus* (*ἐπίσκοπος*, bishop), the term itself occurs in the writings of St. Paul, Phil. i. 1, 1 Tim. iii. 2, and elsewhere; but the word *ἀρχιεπίσκοπος*, or archbishop, is not found till about or after the fourth century. Cyrillus Archiepiscopus Hierosolymitanorum, and Celestinus Archiepiscopus Romanorum, occur under these designations in the proceedings of the council held at Ephesus, A. D. 431. Other terms by which an archbishop is sometimes designated are *primate* and *metropolitan*. The first of these is formed from the Latin word *primus*, 'the first,' and denotes simple precedency, the first among the bishops. The latter is a Greek term, which rendered literally into English would be *the man of the mother-city*, that is, the bishop who resides in that city where is the mother church of all the other churches within the province or district in which he is the metropolitan.

The term metropolitan, when thus analyzed, points out to us the origin of whatever real distinction there is between bishop and archbishop, or, in other words, the cause of that elevation which is given to the archbishop above the bishops in his province, when it is not to be attributed to mere personal assumption, or to be regarded only as an unmeaning title. The way in which Christianity became extended over Europe was this: an establishment was gained by some zealous preacher in some one city; there he built a church, performed in it the rites of Christianity, and lived surrounded by a company of clerks engaged in the same design and moving according to his directions. From this central point, these persons were sent from time to time into the country around for the purpose of promoting the reception of Christianity, and thus other churches became founded, offspring or children, to use a very natural figure, of the church from whence the missionaries were sent forth. When one of these subordinate missionaries had gained an establishment in one of the more considerable cities, remote from the city in which the original church was seated, there was a convenience in conferring upon him the functions of a bishop; and the leading design, the extension of Christianity, was more effectually answered than by reserving all the episcopal powers in the hands of the person who presided in the mother church. Thus other centres became fixed; other bishoprics established; and as the prelate who presided in the first of these churches was still one to whom precedence at least was due, and who still retained in his hands some superintendence over the newer bishops, *arch-bishop* became a suitable designation. Thus in England, when there was that new beginning of Christianity in the time of pope Gregory, Augustine, the chief person of the mission, gained an early establishment at Canterbury, the

capital of the kingdom of Kent, through the favour of King Ethelbert. There, in this second conversion, as it may be called, the first Christian church was established, and from thence the persons were sent out, who at length christianized the whole of the southern part of England. Paulinus, in like manner, a few years later, gained a similar establishment in the kingdom of Northumbria, through the zeal of King Edwin, who received Christianity, and built him a church at York, one of his royal cities, which may be regarded as the chief city of Edwin's kingdom. From York the light of Christianity was diffused over the northern parts of England, as from Canterbury over the southern. It seems to have been the peculiar diligence and dignity of Paulinus which procured for him the title of archbishop, and gave him a province, instead of a diocese only, as was the case with the other members of the Augustinian mission. This was done by special act, under the authority, it is said, of Justus, an early successor of Augustine. But the precedence of the real English metropolitan is acknowledged in two circumstances: in the style, the one being a primate of England, and the other the primate of all England; and in the rank, precedence being always given to the archbishop of Canterbury, and the lord chancellor of England being interposed in processions between the two archbishops.

There is evidence sufficient to show that Christianity had made its way long before the time of Gregory among the Roman inhabitants of Britain and the Romanized Britons; and it is not contended that either Scotland or Ireland owed its Christianity to that mission. Wales has no archbishop; whence it seems to be a legitimate inference that the Welsh church is only a fragment of a greater church in which the whole of England and Wales was comprehended, the church, as to what is now called England, being destroyed by the Saxons, who were Pagans. Yet some have contended that there was an archbishop at Caer-Leon; and others, on grounds equally uncertain, that bishops, under the denomination of archbishops, were settled in those early times at London and York.

The precise amount of rights of superintendence and control preserved by the archbishops over the bishops in their respective provinces, does not seem to be very accurately defined. Happily, these rights are very seldom called into exercise. Yet it seems to be admitted that if any bishop introduced irregularities into his diocese, or was guilty of scandalous immoralities, the archbishop of the province in which his diocese lay might visit, inquire, call to account, and punish. He might, it is said, even deprive. Whether he could depose is a more doubtful point.

One right he possesses of so remarkable a character as to require a specific notice. Every bishop has the patronage of certain dignities or benefices within his diocese, that is, the right of nominating the person who is to enjoy them. At every consecration of a new bishop, or every translation of a bishop from one see to another, the archbishop in whose province the bishopric is has the right of selecting one of these dignities or benefices to be filled up by his nomination whenever it becomes vacant. This is called the archbishop's option; and the right is now regarded as belonging so much to the person of the archbishop and not to his office, that if the archbishop die before the incumbent of such benefice or dignity, the right of nominating descends to the heir or devisee of the archbishop. This existed originally in the form of a demand of the archbishop on each bishop to provide for some one of his chaplains.

The archbishop also nominates to the benefices or dignities pertaining to the bishops in his province, if not filled up within six months from the time of the avoidance.

Certain of the bishops are nominally officers in the Cathedral of Canterbury, or in the household of the archbishop. The archbishop has also certain honorary distinctions; he has in his style the phrase 'by Divine providence,' but the bishop's style runs 'by Divine permission;' and while the bishop is only installed, the archbishop is enthroned.

The archbishops may nominate eight clerks each to be their chaplains. The archbishop of Canterbury claims the right of placing the crown upon the head of the king at his coronation; and the archbishop of York claims to perform the same office for the queen consort. The archbishop of Canterbury is the chief medium of communication between the clergy and the king, and is consulted by the king's ministers in all affairs touching the ecclesiastical part of the constitution; and he generally delivers in parliament what, when

unanimous, are the sentiments of the bench. The two archbishops have precedence of all temporal peers, except those of the blood-royal; and except that the lord chancellor has place between the two archbishops. Before the Reformation, the archbishop of Canterbury occupied a very elevated station with reference to the whole church, having at general councils the precedence of all archbishops, and being regarded somewhat in the light of a patriarch, presiding, as he was supposed to do, over the several kingdoms of England, Wales, Scotland, and Ireland.

The province of the archbishop of York consists of the six northern counties, with Cheshire and Nottinghamshire; to these were added, by Act of Parliament in the time of Henry VIII., the Isle of Man: in this province he has four suffragans, the bishop of Man, the bishop of Durham, the only see in his province of Saxon foundation, and the bishops of Carlisle and Chester. Of these, the bishopric of Carlisle was founded by King Henry I. in the latter part of his reign, and the bishopric of Chester by King Henry VIII.; so thinly scattered was the seed of Christianity over the northern parts of the kingdom in the Saxon times. The rest of the kingdom forms the province of the archbishop of Canterbury, in which there are twelve bishoprics of Saxon foundation; the bishopric of Ely, founded by Henry I.; the bishoprics of Bristol, Gloucester, Oxford, and Peterborough, founded by Henry VIII.; and the four Welsh bishoprics, of which St. David's and Llandaff exhibit a catalogue of bishops running back far beyond the times of St. Augustine. The twelve English bishoprics of Saxon foundation are London, Winchester, Rochester, Chichester, Salisbury, Exeter, Bath and Wells, Worcester, Hereford, Lichfield and Coventry, Lincoln, and Norwich. The dioceses of the two English archbishops, or the districts in which they have ordinary episcopal functions to perform, are, for Canterbury, the greater part of the county of Kent, a portion of that county forming the diocese of Rochester, a number of parishes distinct from each other, and called Peculiars, in the county of Sussex, with small districts in other dioceses, particularly London, which belonging in some form to the archbishop, acknowledge no inferior episcopal authority. The diocese of the archbishop of York consists of a great portion of the county of York, and the whole county of Nottingham, with some detached districts. Exact knowledge of the diocesan division of the country is of general importance as a guide to the depositaries of wills of parties deceased; but since the introduction of the funding system, there being scarcely a family which has not a share in the kind of property thus created, wills are generally proved in the court of the archbishop of Canterbury, as the Bank acknowledges no probates but from thence.

Lives of all the archbishops and bishops of England and Wales are to be found in an old book entitled *De Præsulibus Angliæ Commentarius*. It is a work of great research and distinguished merit. The author was Francis Godwin, or Goodwin, bishop of Llandaff, and it was first published in 1616. A new edition of it, or rather the matter of which it consists, translated and recast, with a continuation to the present time, would form a useful addition to our literature. There is also an octavo volume, published in 1720, by John le Neve, containing lives of all the Protestant archbishops, but written in a dry and uninteresting manner. Of particular lives there are many, by Strype and others; many of the persons who have held this high dignity having been distinguished by eminent personal qualities, as well as by the exalted station they have occupied.

St. Andrew's is to Scotland what Canterbury is to England; and while the episcopal form and order of the church existed in that country, it was the seat of the archbishop, though till 1470, when the pope granted him the title, he was known only as the *Episcopus Maximus Scotiæ*. In 1491, the bishop of Glasgow obtained the title of archbishop, and had three bishops placed as suffragans under him.

In Ireland there are four archbishoprics, Armagh, Dublin, Tuam, and Cashel. Two of these, Tuam and Cashel are, by the Act 3 and 4 Will. IV., c. 37, to be reduced to bishoprics on the occurrence of the next vacancies. Catalogues of the archbishops of Ireland and Scotland may be found in that useful book for ready reference the *Political Register*, by Robert Beatson, Esq., of which there are two editions.

To enumerate all the prelates throughout Christendom to whom the rank and office of archbishop are attributed would extend this article to an unreasonable length. The

principle exists in all Catholic countries, that there shall be certain bishops who have a superiority over the rest, forming the persons next in dignity to the great pastor *pastorum* of the church, the pope. The extent of the provinces belonging to each varies, for these ecclesiastical distributions of kingdoms were not made with foresight, and on a regular plan, but followed the accidents which attended the early fortunes of the Christian doctrine. In Germany, some of the archbishops attained no small portion of political independence and power. Three of them, viz. those of Treves, Cologne, and Mentz, were electors of the empire. In France, under the old regime, there were eighteen archbishoprics, all of which, except Cambray, claimed to have been founded in the second, third, and fourth centuries; the foundation of the archbishopric of Cambray was referred to the sixth century. The French have a very large and splendid work, entitled *Gallia Christiana*, containing an ample history of each province, and of the several subordinate sees comprehended in it, and also of the abbeys and other religious foundations, with lives of all the prelates drawn up with the most critical exactness.

The word *suffragan*, used in this article, may require some explanation. A *suffragan*, in the more ordinary sense of the term, is a kind of titular bishop, a person appointed to assist the bishop in the discharge of episcopal duties; and among the reforms meditated at the close of the reign of King Henry VIII., was the introduction of a considerable number of *suffragan* bishops of this class, and some persons were actually consecrated. But every bishop within his province is sometimes spoken of as a *suffragan* of the archbishop, being originally, in fact, little more. Questions have been raised respecting the origin of the word *suffragan*, which is by some supposed to be connected with *suffrages* or votes, as if the bishops were the voters in ecclesiastical assemblies; but more probably, if connected with *suffrages* at all, the term has a reference to their claiming to vote in the election of the archbishop. A great question respecting the right of election of an Archbishop of Canterbury, between the *suffragans* of his province and the canons of Canterbury, arose in the time of King John, and is a principal occurrence in the contest which he waged with the pope and the church.

ARCHDEACON. In contemplating the character and office of the bishop in the early ages of the church, we are not to regard him as a solitary person acting alone and without advice. He had a species of clerical council around him, persons who lived a kind of collegiate life in buildings attached to the great cathedral church, each of whom, or at least several of whom, possessed distinct offices, such as those of chancellor, treasurer, precentor, and the like. These persons are now often called canons; but the most general name by which they are to be known, as the institution existed in remote times, is that of deacon, a term of which dean is a contraction. Deacon appears to come from the Greek term *διάκονος*, the name of that officer in the church of whose appointment we have an account in Acts, cap. vi. To one of these deacons precedence was given, and no doubt some species of superintendence or control, and to him the title of *archdeacon* was assigned.

In the name, then, there is no indication of any peculiar employment. What now belongs to the archdeacon was antiently performed by the officer in the bishop's court, called the *chorepiscopus*; and the manner in which the archdeacon usurped upon this obsolete officer and attracted to himself the functions which belonged to him, is supposed to have been this;—being near the bishop and much trusted by him, the archdeacon was often employed by the bishop to visit distant parts of the diocese, especially when the bishop required particular and authentic information, and to report to the bishop the actual state of things. Hence it was, that the archdeacon was spoken of by very early Christian writers as being the *bishop's eye*; and from this power of inspection and report the transition was easy to the delegation to him of a portion of episcopal authority, and empowering him to proceed to reform and redress, as well as to observe and report.

If this is a just account of the origin of the archdeacon's power, it is manifest that originally the power would be extended over the whole of a diocese; but at present it is confined within certain limits. In England, according to the *Valor Ecclesiasticus* of King Henry VIII., there are fifty-four archdeaconries or districts through which the visitatorial and corrective power of an archdeacon extends. This

distribution of the dioceses into archdeaconries cannot be assigned to any certain period; but the common opinion is, that it was made some time before the conquest. Each of these districts is assigned to its own archdeacon, with the same precision and certainty as other and larger districts are assigned to the bishops and archbishops; and the archdeacons are entitled to certain annual payments, under the name of procurations, from the benefices within their archdeaconries.

As the archdeacon in antient times intruded upon the *chorepiscopus*, so in recent times he has extinguished the authority and destroyed almost the name of another officer of the church, namely, the rural dean. The archdeaconries are still subdivided into deaneries, and it is usual for the archdeacon when he holds his visitations to summon the clergy of each deanery to meet him at the chief town of the deanery. Formerly, over each of the deaneries a substantive officer, called a dean, presided, whose duty it was to observe and report, if he had not even power to correct and reform; but the office has been laid aside in some dioceses, though in others it has been re-established. But where it has been superseded, the duties are discharged by the archdeacon. It may be added, that though the office of rural dean has been found extremely useful, no emolument whatever is attached to it.

The archdeacons are nominated by the respective bishops. Their duty now is to visit their archdeaconries from time to time; to see that the churches are kept in repair, and that everything is done conformably to the canons and consistently with the decent and orderly performance of public worship; and to receive presentations from the churchwardens of matter of public scandal. They have the power in their courts to enforce reform or to punish the contumacious; an appeal, however, always lies to the superior court of the bishop.

In the revenue attached to the office of archdeacon, we see the inconvenience which attends fixed money payments in connexion with offices which are designed to have perpetual endurance. It arises chiefly from pensions paid by the incumbents. These pensions originally bore no contemptible ratio to the whole value of the benefice, and formed a sufficient income for an active and useful officer of the church; but now, by the great change which has taken place in the value of money, the payments are little more than nominal, and the whole income of the archdeacons is very inconsiderable. The office, therefore, is generally held by persons who have also benefices or other preferment in the church.

Catalogues of the English archdeacons may be found in a book entitled *Fasti Ecclesie Anglicane*, by John le Neve.

ARCHELAUS, a Greek name composed of two words, signifying *rule* and *people*. Moreri has distinct articles on fourteen persons who bore this name; and the reader will find a list of authors so called, in the index to Fabricius's *Bibliotheca Græca*, with some account of them in the body of the work. We shall only notice,

1. **ARCHELAUS**, king of Sparta, known only as one of the reigning kings when Lycurgus remodelled the constitution.

2. **ARCHELAUS**, son of Perdicas, king of Macedonia, who succeeded his father B.C. 413 (Clinton), early in the year. The chronology of his reign has been a subject of controversy; and some writers have erroneously supposed that he was succeeded by a son of the same name. Not much is known of him: the most certain facts are comprised in one sentence of Thucydides, who says that 'Archelaus, son of Perdicas, having become king, built the fortifications now in the land, and cut straight roads, and set the military affairs of the nation on a better footing, as to the provision of arms, horses, and other equipments, than all the eight kings who had preceded him.' (lib. ii. 100.) He is connected with the history of Athens through one event, the revolt of Pydna, a valuable sea-port of Macedonia, towards the close of the Peloponnesian war. He besieged that town, and took it, B.C. 410; and to diminish the chance of future insurrections, by rendering it harder to call in foreign aid, he removed the city farther inland by a distance of twenty stadia, about two miles. These scanty indications seem to point him out as a wise and useful prince. Though he improved the military establishment, he seems to have cultivated peace, for the only war in which we know him to have been engaged, is that for the reduction of Pydna: the few other notices of his reign refer either to his private character, or

to his patronage of arts and literature. The tragic poet Euripides resided for some time at his court, and died there. Plato is said to have been 'very dear' to him; and he sent a pressing invitation to Socrates, who declined to accept it. Zeuxis visited and executed many pictures for his palace, which in consequence became a place of great resort for strangers. He established games at Dium in honour of Jupiter and the nine Muses, which, from the description, 'magnificent religious festivals and dramatic contests' (*θυσίας μεγαλοπρεπείς και σκηνηκοῦς ἀγῶνας*, Diod. xvii. 16), we may presume to have been of as literary and refined a nature as the great festivals of southern Greece.

[From a silver coin in the British Museum.]

The character of this prince, however, has been drawn in darker colours by Plato, who says, that Archelaus was of illegitimate birth, the son of Perdiccas by a slave, and that he gained the kingdom by a series of murders. (*Gorg.* 471, vol. iii. p. 208, ed. Priestley.) His private character was open to various imputations, for which the reader who is curious on this head may consult Bayle; and there is the testimony of Plato and Aristotle, that his excesses led to his death by conspiracy. Diodorus (xiv. 37) says, that he was killed accidentally when hunting, by his favourite, Craterus, or Cratenas. The close resemblance between this tale and that of William Rufus's death cannot fail to strike the reader. Archelaus died B.C. 399, after a reign of fourteen years. (See Mitford, chap. xxxiv. sect. 1; and Clinton, Appendix 4, besides the authorities above quoted.)

3. **ARCHELAUS**, an eminent general in the service of Mithridates, king of Pontus, and the opponent of Sylla when the Mithridatic war was carried on in Greece. In the celebrated siege of Athens, when that city was taken by Sylla, he threw himself into the Peiræus, and defended it obstinately. Compelled at last to evacuate his stronghold, he retreated into Thessaly. He was twice defeated by Sylla, after which he received instructions from his master to make peace on the best terms which could be obtained. Being apprehensive of danger from the jealous temper of Mithridates, he went over to the Romans, by whom he was well received. (See Appian, *Mithridatica*; Strabo, l. xii. and xvii.)

4. **ARCHELAUS**, son of the preceding, obtained the dignity of high-priest of the temple of Comana in Pontus, where there was a temple sacred to Enuo, to which a considerable tract of land and numerous slaves were annexed. He served in the expedition to Egypt of Gabinius, to reinstate Ptolemy Auletes on the throne then occupied by his daughter Berenice; but having gained the affections and the hand of Berenice under the false pretence that he was the son of Mithridates, he went over to her party, and after a six months' reign was slain in battle against the Romans.

5. **ARCHELAUS**, son of the above, succeeded him as high-priest of Comana, and was expelled by Cæsar, B.C. 47, to make room for Nicomedes the Bithynian. Between his wife, Glaphyra, and Mark Antony, an intrigue is said to have subsisted; and from Antony,

6. **ARCHELAUS**, son of Archelaus and Glaphyra, received the kingdom of Cappadocia, B.C. 36. He fought on Antony's side at the battle of Actium, and yet had the rare good fortune to retain his kingdom under Augustus, and even to enlarge it by the acquisition of the lesser Armenia and part of Cilicia. Incurring the displeasure of Tiberius, as it is said, because he neglected the future emperor during his exile at Rhodes, he was summoned to Rome, where he died, A.D. 16, apparently by a natural death brought on by age and infirmity. He is said by Dion to have counterfeited dotage for the purpose of turning aside the tyrant's suspicions. (Tacitus, *Ann.* ii. 42; Dion, lvi.; Bayle, *An. Un. Hist.*)

ARCHELAUS the Milesian, an eminent philosopher of the Ionic school, and the last who presided in it in direct

succession from Thales. He succeeded Diogenes Apollonates as the recognised leader of that school; and was the pupil of Anaxagoras, the predecessor of Diogenes. Removing to Athens, he left no one to occupy his chair; and it may be from this circumstance, or from his having taught publicly what Anaxagoras only taught in private (for Anaxagoras clearly taught the same or similar doctrines before him), that Archelaus is said to have transferred the Ionic school of philosophy to Athens, where he became popular, and numbered Socrates, and according to some authorities, Euripides, among his hearers. He was called 'physicus,' either because physical doctrines formed the most prominent part of his system, or because he was the first who openly taught in Athens the physical doctrines of the Ionic school; and Suidas says, that he composed a work on physics (*συντάξε φυσιολογίας*).

His principal doctrines, so far as we are acquainted with them, are these:—

The principles of all things he taught to be air and infinity (*τὸ ἀπείρον*). What he meant by infinity is a question which Brucker, in his history of ancient philosophy, professes himself unable to decide. Some, however (as Plutarch, *Plac. Philos.* i. 3), say that he supposed infinite air, by its rarefaction and condensation, to be the cause of all things.

The principle of motion he defined to be the mutual secession of hot and cold: the hot being in motion, and the cold stationary.

The sun he thought to be the largest of the stars; the earth round or egg-shaped, and in the centre of the universe.

He taught that men and animals were originally generated out of mud or slime by the heat of the earth, and he attributed mind to both alike.

He taught, like his master, Anaxagoras, that everything was made up of small parts similar to itself as wood of atoms of wood, metal of atoms of metal, bone of atoms of bone, &c.

Speech he defined to be motion of the air; but this correct view is also attributed to Anaxagoras.

He maintained the dangerous doctrine, that just and unjust are produced entirely by law; and that, anterior to law, nothing is either one or the other. It appears probable that by law he meant solely human institutions; but we do not know enough of his doctrine to assert positively that he meant to exclude a moral law of conscience derived from the Deity.

Archelaus seems to have commenced teaching at Athens about B.C. 450, in the interval between the first and second visit of Anaxagoras to that city (see Clinton on that year) the dates of his birth and death we do not find clearly laid down. (Diog. Laert.; Brucker, *Hist. Philos.* vol. i. p. 518; Fabricius, *Bibl. Gr.*)

ARCHELAUS, bishop of Carrhæ in Mesopotamia, is remarkable only for his dispute with the heretic, Manes, about A.D. 278. He published the controversy in two books, entitled *Acta Disputationis*, &c., in Syriac, which were translated into Greek by Hegemonius. A fragment of this work is extant, edited by Valesius, in the notes to his Socrates (pp. 197, 203, lib. i. c. 22); and again in a more complete form by Zaccagnius, in his 'Collectanea Monumentorum veterum Ecclesiæ Græcæ,' Rom. 1698. (Fabricius, *Bibl. Gr.*)

ARCHELAUS, the second son of the fifth wife of Herod the Great: his mother, Malthaka, was a Samaritan. His father's last will declared him heir to the throne. Immediately after the death of Herod, A.D. 3, he exercised the regal power, but did not assume the title till his nomination should be confirmed by the Roman emperor. As soon as he had celebrated the obsequies of his father, he received the homage of the people. The Jewish nation having long groaned under the yoke of Herod, received with joy the promises which the uncertainty of Roman favour extorted, at the commencement of his reign, from the policy of Archelaus. But before he received the imperial sanction to his authority, he gave abundant proof of a temper as cruel and a purpose as tyrannical, as those which had characterized his father's reign. On the feast of the Passover a number of factious Jews stationed themselves in the temple, and instigated the populace to demand that Archelaus should avenge the death of two favourite teachers who were executed during Herod's reign for having destroyed a golden eagle. Archelaus sent a party of his guards to seize the ringleaders, but the rabble killed most of the soldiers. Upon

this he employed the whole force of his arms against the rioters, and 3000 of them were massacred. The rest escaped to the neighbouring mountains.

Archelaus presented himself in person before Augustus at Rome, and solicited the ratification of his power on the grounds of being the successor appointed by his father, and of his attachment to the Roman customs and government. His claim was disputed by many members of his family, who produced a former testament of Herod, in which Antipas was named as heir to the throne. Petitions against his appointment were also presented to the emperor by the Jewish nation, who deprecated the confirmation of the authority of Archelaus, on the ground of his having already exercised injustice and cruelty, and they requested an alteration in the form of government. Archelaus was also accused of retaining the legacies of Herod. The emperor gave a patient hearing to all parties. He considered that it would be impolitic to accede to the demands of the Jews, but he placed only the districts of Judæa Proper, Idumæa, and Samaria, forming about half of the dominions of Herod, under the government of Archelaus. The rest, with some small exceptions, was divided between Herod Antipas and Philip. These three princes were not called kings but ethnarchs, and their territories were not called kingdoms but ethnarchies. Archelaus built the city called after his own name, Archelais. We learn from Josephus (ed. Hudson, i. 865), that Archelais was built before the tenth year of Archelaus's reign. He married Glaphyra, widow of his brother Alexander, by whom she had children: this was a direct violation of the Jewish laws. Irritated by his conduct, and weary of the oppressive tyranny of his administration, in the tenth year of the reign of Archelaus the Jews again appealed to Augustus. Their complaints appearing well founded, and being accompanied by accounts of frequent insurrections, the emperor dispossessed Archelaus of his authority, banished him to Vienna in Gaul, and confiscated his property. It is supposed that he ended his days in the place of his exile, leaving no posterity.

To understand the history of Archelaus in connexion with preceding and subsequent events, the reader must refer to Josephus, *On the Jewish War*, from book i. chapter 28, to book ii. chapter 8; and the *Antiquit.* book xvii. Compare ירמיהו ב' נוריהו, ed. Breithaupt, v. 35, from page 497 to 528, and also page 564.

ARCHENHOLTZ, JOHANN WILHELM VON, was born at Danzig in 1745. He entered the Prussian army, in which he served during the whole of the seven years' war, and was made a captain. He afterwards retired from the service, and travelled over a considerable part of Europe, and at last settled at Hamburg, where he published several works, which became very popular in Germany. The first work that established his literary reputation was his *England und Italien*, published in 1785, in which he gave, not the journal of a tour, but a methodical description of the two countries, especially with regard to their social and moral features, and their political institutions. The part concerning England is the most elaborate, and may be considered upon the whole as one of the most detailed accounts of this country given by a foreigner. Archenholtz had visited England repeatedly and stayed there nearly six years between 1769 to 1779. He had been likewise several times in Italy, and had resided there about three years. He dedicated his book to his friend Wieland, who was then at Weimar. The work went through several editions, and was translated into French. In the preface to the second German edition, 1787, Archenholtz replied to the charges of injustice and asperity towards Italy with which he had been reproached. In fact he had placed in juxtaposition two countries widely dissimilar; he had viewed Italy with the eye of a political and moral philosopher, rather than with that of a poet, or painter, or classical scholar, and the point of view which he chose was the most unfavourable to that country. Italy has changed considerably since that time, and many of Archenholtz's observations are no longer applicable. Archenholtz's admiration of England, on the other side, displeased many persons on the continent; he cannot, however, be called a blind admirer, for he points out many faults in the English institutions at that period, and exposes with no sparing hand the vices and follies of London. The next work of Archenholtz was a *History of the Seven Years' War*, in which he collected the information scattered through many memoirs and records of those memorable campaigns, and especially consulted the valuable work of Major Tempelhof of the Prussian artillery, *Geschichte des Siebenjährigen Kriegs*, published at Berlin in 1785. But these were professional works, and Archenholtz's object was to write a history suited to the common reader. His *Seven Years' War* was published at Hamburg in 1788. It was translated into Latin by Professor Reichard, 'for the benefit,' as the Professor states, 'of readers of other countries who were unacquainted with the German language, and published at Baïreuth in 1792, under the title of *Historia Belli Septennis in Germania*. Archenholtz next wrote a history of Gustavus Vasa, the restorer of Swedish independence, preceded by a summary of the history of Sweden from the oldest records to the end of the sixteenth century. In prosecuting his researches on this subject, he consulted the old Swedish and Danish chroniclers and his work is valued for its accuracy. It was published at Hamburg in 1801, and was translated into French and published at Paris, under the title of *Histoire de Gustave Vasa*, 2 vols. 8vo. 1803. Archenholtz wrote also several other minor works. About the time of the French revolution, he became editor of the *Minerva*, a German literary journal, published at Hamburg, which enjoyed considerable reputation for many years. In the number for February, 1793, Archenholtz warmly remonstrated against the imprisonment of General La Fayette, who, having escaped from the proscription of the French terrorists, was arrested by the allies and confined in the fortress of Olmutz in Moravia. Archenholtz died in 1812.

ARCHER (*Toxotes*, Cuv.), in zoology, a genus of acanthopterygious fishes, belonging to the family squamipennæ, or those which are distinguished by having, not only the soft parts, but often the very spines of the dorsal and anal fins, covered with scales like the rest of the body, and not always very easily distinguished from it. Though the single species upon which this genus is founded had been long known to naturalists, and described under the various names of *Scarus schlosseri*, *Sciæna jaculatrix*, *Labrus sagittarius*, and *Coius chatareus*, by the different writers on ichthyology, yet it was left by Baron Cuvier to point out its appropriate generic characters, and to distinguish it definitely from the different groups with which it had been previously confounded. These characters are found in the short and compressed form of the body; in the dorsal fin being situated very far back, provided with very strong spines, and like the anal, which is placed very nearly opposite to it, covered on its soft parts with large tough scales; in the short, depressed shape of the muzzle, and in the length of the under jaw, which considerably surpasses the upper, and entails upon the animal the singular habit from which it has derived the name of *the archer*. The gills have six branchiostegous rays; the teeth are small, sharp, and dispersed over the jaws, tongue, and palate; the stomach is short and broad, the air-bladder large, and the pylorus provided with twelve cæcal appendices. The only known species is

The Toxotes jaculator of Cuvier, which is found in Java and Sumatra, and has been long celebrated for the singular instinct which it displays in catching flies and other insects which are its prey. Comparatively speaking, there are very few species among the numerous class of fishes distinguished by superiority of instinct or address; but the very rarity of their occurrence makes the partial instances which are occasionally met with still more remarkable, and among these the means which the archer and a species of chætodon (*C. Rostratus*) employ for procuring food are entitled to especial notice. The tubular form of the mouth in these animals permits them to squirt or project small quantities of water to some distance, and with considerable force; when, therefore, the archer perceives a fly or other insect resting on the leaves of the aquatic plants which overhang or swim on the surface of the stream, it projects, or, as it were, shoots a single drop, not directly towards the insect, but obliquely upwards, in such a manner as to strike it in falling, thus preventing it from perceiving its danger and escaping in time. With such accuracy is the aim taken, that though frequently projected to the height of four or five feet, the drop seldom fails to hit the mark and precipitate the insect into the water, where it is, of course, within reach of the archer. The fish itself is of a yellowish colour, marked on the back with five brown spots.

ARCHERY, the art of shooting with a bow and arrow. With respect to the origin of archery, the use of the bow may be traced to the remotest antiquity, and it occurs in the

history of many different nations; but some people, the antient Britons for instance, did not use the bow. The first notice which we find of it is in Genesis (xxi. 20), where it is said that Ishmael the son of Abraham 'dwelt in the wilderness and became an archer:' a bow-shot too is mentioned in an earlier verse of the same chapter as a measure of distance. In the Greek mythology we find Apollo armed with the bow and arrow (Homer, *Iliad*, i. 45), and Hercules also, as described in the *Odyssey* (xi. 606). The use of these weapons we may therefore conclude to be of very high antiquity among the Greeks. In the war of Troy, the main force of the Greeks appears to have consisted of soldiers who had heavy defensive armour; but the soldiers of Philoctetes were archers. The Cretans maintained their reputation as skilful bowmen to a late period in their history; and we find Meriones, the companion of the Cretan king Idomeneus, carrying off the prize from Teucer himself (*Iliad*, xxiii. 882). Teucer, the brother of Ajax, who came from the island of Salamis, excelled in the use of the bow and arrow, which appear however to have been considered less honourable weapons than the spear and sword. Ulysses in the *Iliad* fights with the spear and sword, but in the *Odyssey* we find the strength of the suitors tested by the bow which Ulysses had left at home, and which he afterwards uses against his domestic enemies.

In the later times of Greece, archers formed a part of the light-armed troops, in the same manner as the Sagittarii among the Romans afterwards formed a part of the Velites. Procopius records it as a great improvement when the Roman auxiliaries were instructed to draw the right hand to the ear. But the practice itself is of much greater antiquity, as we see in the representations of the sea-fight on the walls of Medinet-Habou, at Thebes in Egypt. (*Egypte, Antiq.*, vol. ii.) It was also, as we learn from Procopius, the fashion with the antient Persians.

[Egyptian Archer.]

The time when the use of the long-bow commenced in England, as a military weapon, is unknown. That which the Normans used at the battle of Hastings was the *arbalist* or *cross-bow*. In the reign of Henry II. we find several facts recorded which show the continuance of the use of the cross-bow; and in that of Henry III. we find cross bowmen forming the vanguard of the army. As a military weapon of England, the arbalist, in all probability, was last used at the battle of Bosworth in 1485, though as late as 1572 Queen Elizabeth engaged by treaty to supply the King of France with 6000 men, armed partly with long, partly with cross bows. It was also used on the Continent in the wars of the sixteenth century.

From the reign of Edward II. the mention of the *long-bow* becomes frequent in our history. At Crécy, at Poitiers, and at Agincourt, as well as in several battles which were gained over the Scots, the victory is ascribed to the English bowmen; and it is particularly noticed that at Crécy the rain, which had slackened the strings of the Genoese cross-bows, had not weakened the effect of the

long-bows which our countrymen used. Edward III. en joined the use of the long-bow in two precepts addressed to the sheriffs of counties; and in the reign of Richard II. an act was passed to compel all servants to shoot with it on Sundays and holidays. By the 7 Hen. IV. the heads of arrows were to be well boiled or brazed, and hardened at the points with steel; all heads otherwise manufactured were to be forfeited, and the makers imprisoned: all arrow-heads, moreover, were to be marked with the maker's name. Henry V. ordered the sheriffs of several counties to procure feathers from the wings of geese, picking six from each goose. Two feathers in an arrow were to be white, and one brown or grey; and this difference in colour informed the archer in an instant how to place the arrow. In the time of Edward IV. an act passed ordaining that every Englishman should have a bow of his own height; and butts were ordered to be constructed in every township for the inhabitants to shoot at on feast days; and if any neglected to use his bow, the penalty of a halfpenny was incurred. An act, 1 Richard III., complains, that by the seditious confederacy of Lombards using divers ports of this realm, bow-staves were raised to an outrageous price; that is to say, to eight pounds a hundred, whereas they were wont to be sold at forty shillings. This act provided that ten bow-staves should be imported with every butt of malmsey or Tyre wines, brought by the merchants trading from Venice to England, under a penalty of 13s. 4d. for every butt of the said wines in case of neglect. By 6 Henry VIII., chap. 2, all male servants were to provide themselves with one bow and four arrows, which their master was to pay for, stopping the purchase-money out of their wages. Another statute, enjoining the use of archery more extensively, was passed in 33 Henry VIII. It ordained that every man under sixty, except spiritual men, justices, &c., should use shooting with the long-bow, and have a bow and arrows continually in his house; that he should provide bows and arrows for his servants and children; that every servant, above seventeen and under sixty years of age, should pay 6s. 8d. if he was without a bow and arrows for one month. The inhabitants of every city, town, and place were to erect butts, and practise shooting on holidays, and at every other convenient time. Latimer, in one of his sermons before King Edward VI., published in 1549, enforced the practice of archery from the pulpit. 'Men of England in times past,' he says, 'when they would exercise themselves (for we must needs have some recreation, our bodies cannot endure without some exercise), they were wont to go abroad in the fields of shooting, but now it is turned into glosing, gulling, and whoring within the house. The art of shooting hath been in times past much esteemed in this realm; it is a gift of God that he hath given us to excel all other nations withal; it hath been God's instrument whereby he hath given us many victories against our enemies. But now we have taken up whoring in towns instead of shooting in the fields. A wondrous thing, that so excellent a gift of God should be so little esteemed! I desire you, my lords, even as ye love the honour and glory of God, and intend to remove his indignation, let there be sent forth some proclamation, some sharp proclamation to the justices of peace: for they do not their duty. Justices now be no justices; there be many good acts made for this matter already. Charge them upon their allegiance that this singular benefit of God may be practised, and that it be not turned into bowling, glosing, and whoring within the towns: for they be negligent in executing these laws of shooting. In my time, my poor father was as diligent to teach me to shoot, as to learn me any other thing, and so I think other men did their children. He taught me how to draw, how to lay my body in my bow, and not to draw with strength of arms as other nations do, but with strength of the body. I had my bows bought me according to my age and strength; as I increased in them, so my bows were made bigger and bigger: for men shall never shoot well except they be brought up in it. It is a godly art, a wholesome kind of exercise, and much commended in physic.' Holinshed reports that Henry VIII. shot as well as any of his guards.

The encouragement thus given to shooting with the long-bow caused archery to become a fashionable amusement after the bow had ceased to be used as an instrument of war. Edward VI. was fond of this exercise; and there seems every reason to believe that it was practised by King Charles I. This monarch issued a proclamation in the eighth year of his reign, to prevent the fields near London

from being so inclosed as 'to interrupt the necessary and profitable exercise of shooting.' He is also represented in the frontispiece of Markham's *Art of Archery*, 1634, in the dress and attitude of a Bowman. Public exhibitions of shooting with the bow were continued in the reigns of King Charles II. and King James II.; and an archer's division, at least till within these few years, formed a branch of the Artillery Company.

The most important society of this kind now existing is 'The Royal Company of Archers, the King's body-guard of Scotland.' The exact time of its institution is unknown, but it is referred by the Scottish antiquaries to the reign of their James I., when a commission being appointed to oversee and enforce the exercise of archery in different counties of that kingdom, the most expert bowmen were selected from the mass of those raised, to form a body-guard for the king on perilous occasions; and are stated to have conducted themselves with skill, loyalty, and courage. The rank of the King's body-guard for Scotland was understood from tradition to be vested in the Royal Company, and they accordingly claimed the honour of acting in this capacity to his majesty King George IV. on the occasion of his visit to Scotland in 1822. They attended his majesty at court and on all state ceremonies during his residence in Scotland, and accompanied him on his visit to Hopetoun House, from whence he embarked for London. The captain-general has since been appointed gold-stick for Scotland, and the Royal Company now forms part of the household.

From their own minutes, still extant, it appears that an act of the privy council of Scotland was passed in 1677, conferring on this body the name and title of 'His Majesty's Company of Archers,' and granting a sum of money for a piece of plate to be shot for as a prize. No permanent king's prize, however, was established till 1788, when a sum of money was granted by King George III. to be shot for annually, with which a piece of plate was to be purchased.

During the Revolution of 1688 the Royal Company were opposed to the principles then espoused, and were all but suppressed. On Queen Anne's succession they were revived, and in 1703 received a royal charter confirming all their former rights and privileges, and conferring others upon them. The affairs of the Royal Company, which now consists of about 500 members, are managed by a council of seven, who are chosen annually by the members at large, and in whom is vested the power of receiving or rejecting candidates for admission, and of appointing the officers of the company civil and military. The field uniform of the Royal Company is of dark green cloth, faced with black braiding, with a narrow stripe of crimson velvet in the centre. The hat is of the same colour, with a handsome medallion in front, and a plume of black feathers. They have two standards. New colours, as well as a confirmation of the Royal Company to be the king's body-guard for Scotland, have been given to them by King William IV.

About fifty years ago, the revival of archery as a general amusement was attempted, under the patronage of the then Prince of Wales; and at that time, and subsequently, numerous societies of archers were formed, many of which printed their rules and orders. Some few, it is believed, are still in existence.

The more curious books on the subject of archery are Ascham's *Toxophilus*, 4to., 1545, 1571, 1589; *Certain Discourses, written by Sir John Smythe, Knight, concerning the Long Bow, as also the great Sufficiencie, Excellencie, and wonderful Effects of Archers*, &c., 4to., London, 1590; *A Brief Treatise to prove the Necessitie and Excellence of the Use of Archerie*, by R. S., 4to., London, 1596; Nead's *Double-Armed Man*, 4to., London, 1625; Markham's *Art of Archerie*, 8vo., London, 1634; and Wood's *Bowman's Glory*, 8vo., 1682. To these may be added, the *Ayme for Finsburie Archers*, 12mo., London, 1628; and the *Ayme for the Archers of St. George's Fields*, 8vo., 1664.

The distance to which an arrow could be shot from the long-bow depended much upon the strength and art of the Bowman; but, in general, the distance was reckoned from eleven to twelve score yards. In 1794, the Turkish ambassador's secretary, in a field behind Bedford Square, near the Toxophilite ground, with a Turkish bow and arrow, shot 415 yards partly against the wind, and 482 yards with the wind. He said that the then grand sultan shot 500 yards, which was the greatest performance of the modern Turks; but that pillars stood on a plain near Constantinople, com-

memorating ancient distances about 800 yards. The Baron de Tott says, in his *Memoirs*, Paris, 1785, tom. ii., p. 107 'Les empereurs Turcs ont eu presque tous la vanité de prétendre à ce genre de célébrité.' 'Nearly all the Turkish emperors have had the vanity of wishing to acquire this kind of celebrity.'

Ascham has enumerated fifteen sorts of wood, of which arrows were made in England in his time, namely, brazell, turkieewood, fusticke, sugarcheste, hardbeame, byrche, asbe oak, service-tree, alder, blackthorn, beach, elder, aspe, and salow. Of these, asp and ash were preferred to the rest, the one for target-shooting, the other for war. Whistling arrows have been once or twice found on fields of battle of the time of Edward IV. They were chiefly used, it is believed, for giving signals in the night. The Chinese have used whistling arrows from time immemorial. The arrows shot from cross-bows were called quarrels, or bolts. They were usually headed with a large square pyramid of iron; but had sometimes other forms given to them.

For many of the materials of this article, we are indebted to Barrington's *Observations on the Practice of Archery in England*, printed in the *Archæologia*; and to the late Mrs. Banks's *Manuscript Collections on Archery*, preserved in the British Museum.

ARCHES, COURT OF, is the supreme court of appeal in the archbishopric of Canterbury. It derives its name from having formerly been held in the church of St. Mary le Bow (*de Arcubus*), from which place it was removed about the year 1567 to the Common Hall of Doctors Commons, where it is now held. The acting judge of the court is termed Official Principal of the Court of Arches, or more commonly Dean of the Arches. This court has ordinary jurisdiction in all spiritual causes arising within the parish of St. Mary le Bow and twelve other parishes, which are called a deanery, and are exempt from the authority of the bishop of London. The Court of Arches has also a general appellate jurisdiction in ecclesiastical causes arising within the province of Canterbury, and it has original jurisdiction on subtraction of legacy given by wills proved in the prerogative court of that province. The Dean of the Arches for the time being is president of the College of Doctors of Law practising in the Ecclesiastical and Admiralty Courts, incorporated by royal charter in 1768, and the advocates and proctors who practise in these courts receive their admission in the Arches Court. The judge is the deputy of the archbishop, who is, in legal consideration, the judge of the court. The Dean of Arches has always been selected from the College of Advocates. There are four terms in each year, and four sessions in each term. Causes are conducted by libel (*libellus*, a little book) and answers, or by articles, according to their respective nature. Responsive pleas are termed allegations. Depositions of witnesses are taken in private by examiners of the court appointed for that purpose by the registrar, with the approbation and sanction of the judge and archbishop. The evidence being read either before trial by the judge, or read over at the trial, and the case argued by counsel, judgment is pronounced in open court. For the last twenty years and upwards, reports of decisions in the Ecclesiastical Courts have been laid before the public, which was not the case formerly. Execution of the sentence may be enforced by the compulsory process of contumacy, significavit, and attachment. An appeal lay from this court to the Court of Delegates, or more strictly to the king in chancery (st. 25 Henry VIII. c. 19), by whom delegates were appointed to hear each cause, the appeal being to him as head of the church in place of the Pope. By 2 and 3 Wm. IV. c. 92, appeals are transferred from the Court of Delegates to the king in council. The ecclesiastical courts are competent to entertain criminal proceedings in certain cases, and also to take cognizance of causes of defamation: for which last offence persons were formerly directed to do penance, but this has very rarely been required by the Arches Court of late years. There is no salary attached to the office of judge; and his income arising from fees, as also that of the registrar, is very small. One judge has for many years presided in the Arches and in the Prerogative Courts. It is understood that a measure is in preparation by which this court, in common with all the ecclesiastical courts, will be much modified.

ARCHIAS, A. LICINIUS, a Greek poet of Antioch in Syria, whose name would never have reached us but for the beautiful oration of Cicero, pronounced in his defence. We cannot, however, regard him as anything else

than a fly preserved in amber. nor are we inclined to think, though he was the intimate friend of many illustrious men at Rome, and gave lessons to Cicero in Greek philosophy and rhetoric (*Arch. c. i.*), that his talents were of that high order which Cicero would have us believe. He had undertaken to celebrate, in verse, the grand event in the orator's history—the conspiracy of Catiline—and nothing more was required to gain the good-will of that great though vain man. Archias came to Rome in the consulship of Marius and Lutatius Catulus, B.C. 102, and lost no time in recommending himself to these leading persons by a poem in celebration of their victories over the Cimbri. He was, in fact, the poet-laureat of those days: he was the intimate friend of Lucullus, and we find him chanting the praises of that luxurious Roman in a poem on the Mithridatic war. It was chiefly through the influence of Lucullus that he was admitted to the freedom of Heraclea, one of the most powerful Greek cities in the south of Italy, and one whose citizens were entitled to all the privileges of Romans. It was thus that Archias became a naturalized citizen of Rome. Why a certain Gratus should have contested this right, we have no means of discovering; but as the public archives of Heraclea had been destroyed by fire, Archias was unable to produce any legal document in proof of his claim. The result of the trial, which took place at least after the consulship of Cicero, B.C. 63, is unknown, but it is not probable that the jury resisted the eloquent harangue of the orator and the influence of the leading men of Rome. If we could be certain that the epigrams published under his name, in the *Anthologia Græca*, were his productions, we should feel satisfied that we had justly appreciated his character. They are in general below mediocrity, but as there were several of the same name as the poet, we cannot decide to whom they really belong. These epigrams have been published separately by Ilgen, *Animadvers. Histor. et Critic. in Cic. Orat. pro Archia*, Erfurt, 1797; and by Hülsemann, in his edition of *Cicero's Oration for Archias*, Lemgo, 1800, 8vo. We may observe, that lately an attempt has been made to prove that this oration of Cicero in defence of Archias is not genuine; but we think that the discovery by Angelo Mai, in the Ambrosian library at Milan, of a commentary on the oration by Asconius Pedianus, who flourished A.D. 30, puts the matter beyond any reasonable doubt. (See the work to which we allude by Schroëter, *Oratio quæ vulgo fertur pro Archia rec. suasque Observationes adiecit*, Lips. 1818; and the opposite view of the question by Platz, in the *Krit. Bibliothek von Seebode*, 1820.)

ARCHIATER (in Greek *ἀρχίατρος*), an honorary distinction conferred on physicians in the times of the Roman emperors, and still employed in some of the continental countries. Physicians generally occupied a very subordinate station in Rome during the republican period: in fact, no well-educated medical men existed among the Romans at that time; and the Greek physicians who went to Rome were not at first favourably received. Julius Cæsar at length bestowed the rights of Roman citizenship on the foreign physicians practising at Rome; and the Emperor Augustus, after his recovery from a dangerous illness, not only conferred on his own physician, Antonius Musa, the honours of knighthood, but is said to have exempted all physicians from the payment of taxes and other public burdens. The Emperor Nero first gave the title Archiater (*chief of the physicians*) to his medical attendant, Andromachus the elder, well known as the inventor of a celebrated compound preparation called Theriaca. It is probable that the Emperor only intended to express, by this title, the consideration in which he held his own physician; but it appears that, soon afterwards, the Archiatri were charged with some kind of superintendence over the medical profession. Thus Galen says of Andromachus: "It appears to me that he was appointed by the emperor at that time to reign over us;" and we also find that the word *Archiater* was translated into Latin by the words *superpositus medicorum*, 'superintendent of the physicians.' At a later period, however, the rank or office of the Archiatri seems to have undergone some change; and we find two classes of them distinguished, viz., the Archiatri of cities, and those of the court. The first law regarding the Archiatri of cities (*Archiatri populares*) was given by Antoninus Pius. He ordered each smaller town to have five, the larger seven, and the largest cities to have ten physicians, distinguished by the above name, and wholly exempted from the payment of taxes and public burdens: thus it appears that the exemption of all

practitioners, if it ever existed, was found too extensive a privilege. At Rome, there were fourteen Archiatri appointed for the different districts of the city, besides one for the vestal virgins, and another for the gymnasia: they were elected by the citizens and proprietors, and approved by their colleagues. In later times, the Archiatri of a higher rank appear to have had the sanction of the emperor; and it is not improbable that some sort of examination was also requisite for their admission. Besides enjoying the privileges alluded to, the Archiatri derived from the towns certain remunerations in kind (*annonaria commoda*), as well as salaries. It was their business to treat poor patients gratuitously, but in treating other persons they were authorized to take fees like their professional brethren. They formed medical committees or colleges in each city, and superintended the public health, and the state of the medical profession, and they also taught the principles and practice of medicine. Thus a decree of Constantine the Great says, "We order rewards and salaries to be given to them, that they may the more readily imbue many pupils with liberal studies and the said arts." There is a variety of laws relative to the Archiatri, shewing that the Romans regarded the members of the medical profession as deserving and requiring the attention and protecting care of government. The physicians attached to the imperial court took the title of Archiatri of the palace, and also formed a corporation, with certain rights, privileges, and distinctions of rank, which became more important during the reigns of the later emperors, when strict rules of precedence were established for all persons connected with the court and government. The *Count of the Archiatri* was a "*vir spectabilis*," and equal in rank to the dukes and to the vicars of the emperor.

In modern times, the name of Archiater has, in imitation of the antient fashion, sometimes been assumed by physicians holding public appointments in cities, but more frequently by the physicians of kings and princes. In Sweden and Denmark, however, the dignity of Archiater still exists, as the highest honour conferred on medical men: in Sweden there are only two Archiatri, who act as physicians to the king.

ARCHIDAMUS. Five kings of Sparta are known to us by this name. They were of the royal line of the Proclidae, and were not the least distinguished of their family. The first lived before the historical age of Sparta, and his name, mentioned by Herodotus (viii. 131), is the only memorial left of his existence.

ARCHIDAMUS II., son of Zeuxidamus, succeeded to the throne when his grandfather, Leotyichides, was banished from Sparta for allowing his military proceedings in Thessaly to be influenced by a bribe from his opponents. Archidamus reigned from B.C. 469 to 427; and his character, as drawn by Thucydides and Diodorus, exhibits all the peculiar features of the Doric race. Prudence and foresight, steadiness of purpose, and gravity of deportment, are the more prominent qualities which he displays. It was in the fourth year of his reign (B.C. 464) that Sparta was nearly annihilated by the violence of an earthquake, an opportunity which the Messenians did not fail joyfully to seize, with the hope of regaining their independence. The presence of mind displayed by Archidamus on this occasion saved what remained of the city from the hands of an exasperated foe; but it was not till ten years had elapsed, that this Third Messenian War, as it is called, was brought to a close, when the Messenians evacuated their citadel, Ithome. (Diod. Sic. xi. 64. Thucyd. i. 103.) On the part which Archidamus took in the affairs of his country, history is silent for a long succession of years; nor does his name again appear till we find him pleading the cause of peace in the important council held by the Lacedæmonians before they resolved on the Peloponnesian war. His voice was not listened to by his countrymen, and a declaration of war was the result of their deliberation (B.C. 431). So much confidence, however, had they that he would perform his duty, that they placed him at the head of the troops to be led against the Athenians. He was their general also in their second (B.C. 430) and third expeditions (B.C. 428); but it is unnecessary to notice his proceedings in the war, as they had little effect in deciding the contest. He was succeeded by his son Agis II., probably in B.C. 427. (Thucyd. i. 79, ii. 10-20, 71, iii. 1.)

ARCHIDAMUS III., the son of the celebrated Agesilaus, succeeded his father B.C. 361, and died B.C. 338. We find him in command of the Spartan troops during his

father's lifetime, B.C. 367, and gaining a battle against the Arcadians and Argeians, which is known in history as *the tearless victory* (τὴν ἄδακρυν μάχην). Not one of the Spartans fell, while a very large number of the enemy were cut to pieces. (Xenoph. *Hell.* vii. 1. 28-32.) In the sacred war, which broke out B.C. 356, in consequence of the seizure of the temple of Delphi by the Phocians, it would appear that Archidamus gave at least secret support to Philomelus, the general of that people; but when the Lacedæmonians at last took an active part in the war, the name of Archidamus does not appear. There is, indeed, no other fact mentioned respecting him, except that he was sent (B.C. 338) to Italy to assist the inhabitants of Tarentum, then engaged in war with their neighbours the Lucanians. He fell fighting bravely at the head of his troops; and a statue was erected to his honour, at Olympia, by his countrymen. He was succeeded by his son Agis III. (Diod. Sic. xvi. 24, 63; Strabo, vi. 280; Paus. iii. 10.)

ARCHIDAMUS IV., the son of Eudamidas, is not mentioned, except by Plutarch, who states that he was defeated (B.C. 296) by Demetrius Poliorcetes; and Archidamus V., son of another Eudamidas, was put to death by his royal colleague, Cleomenes III., somewhere between B.C. 236-220. In him ended the line of the Proclidæ, for though he left five sons, they were passed over, and Lycurgus, not of the royal family, was raised to the throne. (Polyb. iv. 2, v. 37.)

ARCHIGENES of Apamea, a medical author and practitioner, who enjoyed a great reputation at Rome in the commencement of the second century, during the reign of the Emperor Trajan. He must have held a very distinguished rank among his contemporaries, as appears from several passages in the *Satires of Juvenal* (vi. 236, xiii. 98, xiv. 259), in which his name is employed to denote a great physician generally. Archigenes followed the principles of the pneumatic sect, founded by Athenæus of Attalia, and is known to have written a considerable number of treatises on pathology, the practice of medicine and surgery. His works were thought very highly of in antiquity, although the author is accused of the same obscurity of style which the pneumatic physicians in general had adopted from the stoic philosophers, from whom they also derived some of their principal doctrines. The writings of Archigenes seem to have existed till the sixth century: but the only remains which we now possess are fragments contained in the works of Galen, Ætius, and Oribasius. Galen generally quotes Archigenes in order to criticise his opinions: Ætius and Oribasius give more copious extracts from him. Some of the surgical fragments have been collected by Cocchi, *Græcorum Chir. libr.* pp. 117, 118, 155. The passages contained in Oribasius have been published by De Matthiæ (xxi. *Med. Opusc. ex Oribasii Cod. Mosquæ*, 1808, 4to.)

ARCHIL (also called ORCHIL, in Chambers's *Dict. of Arts and Sciences*), *litmus*, or *turnsole*, is a blue dye procured from the *rocella tinctoria* and *ceanora tartarea*, which are lichens growing abundantly in the Canary and Cape Verde Islands. The colouring matter of these plants appears to be a peculiar vegetable principle which has been called *erythrine*: it may be extracted either by means of alcohol or ammonia, but the latter is employed by those who manufacture the colour, which is generally sold in small flat pieces, and known by the name of litmus.

The blue colour of litmus is soluble in water and in alcohol: a strong infusion, when looked at in mass, is purple, but a diluted one is of a pure blue colour by day-light, and red by candle-light. Acids redden the colour of litmus, and this effect is produced even by the weakest of them, as carbonic acid and sulphuretted hydrogen; when mixed with the latter, and kept for some days in a well-stopped bottle, the colour is destroyed, but by exposure to the air, or by boiling, the colour is restored. Sulphureous acid and the hyposulphites also bleach litmus. These effects appear to be the result of deoxidization, for the blue colour is restored by the absorption of oxygen.

Archil is employed by chemists to ascertain the presence of acids in solution: for this purpose, the infusion or spirituous tincture is sometimes used; generally, however, paper which has been dyed and dried is preferred, and is well known by the name of *litmus paper*. This test is extremely sensible: according to Mr. Watt (*Phil. Trans.* 1784), it is capable of detecting one grain of sulphuric acid when mixed with 100,000 of water. It may also be used, when it has been

reddened by a weak acid, as a test of the presence of the alkalis: these restore the blue colour of the litmus by saturating the acid which reddened it. Archil is never used alone as a dye, on account of its want of permanence. It is, however, employed for the purpose of deepening and improving the tints of other dyes, and it imparts a bloom which it is difficult to obtain from other substances.

ARCHILOCHUS, one of the most celebrated lyric poets of Greece, who lived at too remote an age to allow any very satisfactory account of his private history to reach us. Yet every traditional fragment respecting him concurs to make us believe that he was one of the most extraordinary men of his time, whose hand was raised against every one, and whom all naturally feared and shunned. He was son of Telesicles by a slave Enipo, and he was born in Paros, an island of the Ægean Sea. The exact period at which he flourished does not appear to have been known to ancient writers, if we may judge from the different epochs in which they place him. By Herodotus (i. 12) and Tatian he is made contemporary with Gyges, King of Lydia, Olympiad 23, or about B.C. 688; by Cicero he is said to have lived in the reign of Romulus; and by Corn. Nepos in the reign of Tullus Hostilius. It is most probable that he lived at the period assigned to him by the father of history; and it is not impossible that Cicero and Nepos intend to refer to the same epoch, though they denote it by two different Roman kings. He was more formidable with his pen than with his sword; like Alcæus and Horace, he thought life preferable to honour, and did not hesitate to turn his back on an enemy. This event in the life of Archilochus took place, according to the old scholiast on Aristophanes, in an expedition against a people called Sai (Σάοι), in Thrace. Archilochus, it would appear, defended himself by boldly declaring that it was better to lose one's shield than life; and Plutarch, in his account of the Spartan republic, states that Archilochus was banished from Sparta for such a remarkable opinion. Others tell us that his verses were of so impure a character, that the Spartans wisely interdicted the perusal of them by their youth. We have no difficulty in forming an opinion respecting his style of poetry, from the concurrent testimony of the ancients; it was full of energy, terse in its language, and vivid in its images. Of his satirical powers no doubt can be entertained, if we credit the story of Lycambes. He had promised his daughter in marriage to Archilochus, but having changed his intention, the poet directed such a fearful satire against the offending Lycambes, that he found no other way of escape but by hanging himself, and some say his three daughters followed his example. On account of his powers of ridicule, over which he does not appear to have had sufficient control, he was driven from his country, and his character seems to have been so well known, that he was always an unwelcome visitor wherever he went. He died in a single combat with one Corax, whom he had probably provoked by his powers of satire, and the oracle of Delphi compelled the murderer to appease the manes of Archilochus by certain expiatory sacrifices. (Plut. *de Serâ*; *Num. Vind.* c. 17.) It was in iambic verse that the poet chiefly excelled; he is said, indeed, to have been the inventor of it, and was one of the three poets whom Aristarchus esteemed most highly in this species of poetry (Vell. Pat. i. 5; Quintil. x. 1). It is also remarked by Vell. Pat. i. 5, that Homer and Archilochus are the only poets who both invented a peculiar style of poetry and carried it to perfection. Some specimens of Archilochus, translated with much spirit, may be seen in Merivale's *Anthology*, London, 1832. Some fragments are found in the *Analecta Vet. Poet. Græc.* of Brunck, Argent, 1785, and they are published separately by Liebel, *Reliquia Archilochi*, Vienna, 1819, 8vo.; also in Gaisford's *Minor Greek Poets*, vol. i.; and in Boissonnade's *Collection*, vol. xv. For his merits as a writer the reader may consult Huch, *Versuch über die Verdienste des Archilochus um die Satyre*, Wittenbach, 1767; *Memoires de l'Acad. des Inscript.* tom. x.

ARCHIMANDRITE, the title of a dignitary in the monastic orders of the Greek church, answering to that of Father Provincial among the monks and friars of the Roman Catholic church. The archimandrite is a superior abbot, having under his jurisdiction several convents of the same district or province. The Russian church, which is a branch of the Greek, has its archimandrites, as well as the Greek church in Hungary and other parts of the Austrian empire.

ARCHIMEDES, the most celebrated of the Greek geometers, and one of the few men whose writings form a standard epoch in the history of the progress of knowledge, was born in Sicily, in the Corinthian colony of Syracuse, in the year 287 B.C.: he was killed when that town was taken by the Romans under Marcellus, B.C. 212, aged seventy-five years. Euclid died about the time of the birth of Archimedes, and Apollonius of Perga was about forty years his junior. Eratosthenes was born about ten years before him.

The life of Archimedes was written, according to Eutocius, his commentator, by Heraclides, but the work is not come down to us, and all that is known of him has been collected from various authors, of whom the principal are Polybius his contemporary, Livy, Plutarch, and Cicero. We, once for all, acknowledge our obligations to the life of Archimedes in Rivault's edition of his works, Paris, 1615; and also to that in M. Peyrard's translation, Paris, 1809.

Archimedes was related to Hieron, the second prince of that name, who came to the throne of Syracuse when Archimedes was a very young man. The reign of this prince, including the time that his son Gelon also bore the royal title, lasted about fifty-five years, during the greater part of which Archimedes remained at Syracuse under their patronage. All that we know of his life during this period, independently of the results of his studies, of which we shall presently speak, is contained in the following incidents. The well known story of Hieron's crown (or Gelon's crown, according to some) is as follows:—Hieron, or Gelon, had delivered a certain weight of gold to a workman, to be made into a votive crown. The latter brought back a crown of the proper weight, which was afterwards suspected to have been alloyed with silver. The king asked Archimedes how he might detect the cheat: the difficulty being to measure the bulk of the crown without melting it into a regular figure. For silver being, weight for weight, of greater bulk than gold, any alloy of the former, in place of an equal weight of the latter, would necessarily increase the bulk of the crown. While thinking on this matter, Archimedes went to bathe, and on stepping into the bath, which was full, observed the very simple fact, that a quantity of water, *of the same bulk as his body*, must flow over before he could immerse himself. It immediately struck him that by immersing a weight of real gold, equal to that which the crown ought to have contained, in a vessel full of water, and observing how much water was left when the weight was taken out again, and by afterwards doing the same thing with the crown itself, he could ascertain whether the latter exceeded the former in bulk. In the words of Vitruvius, 'As soon as he had hit upon this method of detection, he did not wait a moment, but jumped joyfully out of the bath, and running naked towards his own house, called out with a loud voice that he had found what he sought. For as he ran he called out in Greek, εὕρηκα, εὕρηκα, (I have found it, I have found it). According to Proclus, Hieron declared that from that moment he could never refuse to believe anything that Archimedes told him. For the method of detecting the exact quantity of silver alloy, see GRAVITY, SPECIFIC.

The apophthegm attributed to him, that if he had a point to stand upon, he could move the world, arose from his knowledge of the possible effects of machinery, and, however it might astonish a Greek of his day, would now be readily admitted to be as theoretically possible as it is practically impossible. He is reported to have astonished the court of Hiero by moving a large ship, more than usually loaded, with a pulley, or collection of pulleys, and it is said that on this occasion the king pressed him to exert himself in contriving machines for the defence of the city.

He is said to have travelled into Egypt, and while there, observing the necessity of raising the water of the Nile to points which the river did not reach, to have invented the screw which bears his name (see SCREW OF ARCHIMEDES). Athenæus, in mentioning this screw, says it was employed to drain the holds of ships. Diodorus (i. 34) expressly asserts that this machine, which he calls κοχλίας, was his invention. It is certain, from the preface to the *Quadrature of the Parabola*, that Conon of Alexandria was well known to Archimedes, which is some presumption in favour of his having been in Egypt.

After the death of Hieron, the misconduct of his successor Hieronymus, the son of Gelon, provoked a rebellion, in which he was killed. The successful party sided with the Carthaginians, and the Romans accordingly dispatched a

land and naval armament against Syracuse under Appius and Marcellus. Among all the extraordinary stories which have been told of the siege, so much seems clear:—that it lasted three years in spite of the utmost efforts of the besiegers—that this successful resistance was principally owing to the machines constructed by Archimedes—and that the city, after the siege had been some time converted into a blockade, was finally taken by surprise, owing to the carelessness of the besieged during the festival of Diana. Polybius states that catapults and balistæ of various sizes were successfully used against the enemy; that in their nearer approach they were galled by arrows shot not only from the top of the walls, but through port-holes constructed in numerous places; that machines, which threw masses of stone or lead of a weight not less than ten talents, discharged their contents upon the Roman engines, which had been previously caught by ropes; that iron *hands* (or hooks) attached to chains, were thrown so as to catch the prows of the vessels, which were then overturned by the besieged; and that the same machines were used to catch the assailants on the land side, and throw them to the ground. Livy and Plutarch give much the same account; but the curious story of setting the Roman ships on fire by mirrors is first mentioned by John Tzetzes and Zonaras, writers of the twelfth century, who cite Diodorus and others for the fact. But Galen, in the second century, though he mentions that Archimedes set the enemy's ships on fire, says it was done with *πίπρα*, which may refer to any machine or contrivance throwing lighted materials. Lucian also, who lived in the second century, mentions the burning of the ships, but without saying how it was effected. Montucla is of opinion that this report arose from the joining together of two others, namely, that Archimedes wrote a treatise on burning mirrors, and that he did burn the Roman ships; both very credible stories. But their junction must, in our opinion, rank with the many curious things said of Archimedes in later ages. It is difficult to say at what period after his death discoveries respecting an illustrious man will stop: thus Rivault, in 1615, was informed by a very learned Greek, who had translated from that language the lives of the Sicilian martyrs, that one of them, a lady named Lucia, was a descendant of Archimedes, and an ancestress of the Bourbons.

After the storming of Syracuse, Archimedes was killed by a Roman soldier, who did not know who he was; Marcellus, it is said, had given strict orders to preserve him alive. According to Valerius Maximus, when the soldier asked who he was, Archimedes, being intent upon a problem, begged that his diagram might not be disturbed; upon which the soldier put him to death. According to another account, he was in the act of carrying his instruments to Marcellus, when he was killed by some soldiers who suspected he was concealing treasure. At his own request, expressed during his life, a sphere inscribed in a cylinder was engraved on his tomb, in memory of his discovery that the solid content of a sphere is exactly two-thirds of that of the circumscribing cylinder. By this mark it was afterwards found, covered with weeds, by Cicero, when he was residing in Sicily as quaestor.

The fame of Archimedes rests upon the extraordinary advances which he made, considering the time in which he lived, in pure geometry, in the theory of equilibrium, and in numerical approximation. In the first, by an axiom already mentioned [see ARC], and a similar one with respect to curved surfaces, and by the method of EXHAUSTIONS (which see), he made as near an approach to the fluxional or differential calculus as can possibly be done without the aid of algebraic transformations. In the theory of mechanics, he was not only the first but the last of the ancients who reduced anything to demonstration from evident first principles; indeed, up to the time of Stevinus and Galileo, no further advance was made. We proceed to notice his writings, stating very briefly the most important of *his own discoveries only*. The works which have come down to us, of which the first seven are in Greek, are,—

1. *Two Books on the Sphere and Cylinder*.—Here he finds the surface of a right cylinder, a right cone, and a sphere—that a hemisphere is double of a cone of the same base and altitude, and two-thirds of the cylinder of the same base and altitude—that the surface of the circumscribing cylinder (the bases included) is half as great again as the surface of the sphere, and consequently that the surface of the cylinder (not including the bases) is exactly

equal to that of the sphere—he also finds the surface of any spherical segment, and the solidity of a spherical sector. In the second book, he shows how to find a sphere equal to a given cone or cylinder; to cut it into segments having a given ratio; to make a segment equal, either in surface or solidity, to one, and similar to another, segment. Also he shows how to cut off a segment which shall have a given ratio to its inscribed cone.

2. *On the Measurement of the Circle.*—It is here shown that the area of a circle is equal to that of a triangle which has the circumference for its base and the radius for its altitude, and also that the circumference of a circle exceeds three times the diameter by a line which is less than 10 parts out of 70, and greater than 10 parts out of 71, of the diameter. This is the celebrated approximation of Archimedes, and amounts to saying that the ratio of the circumference to the diameter lies between $3 \cdot 1428$ and $3 \cdot 1408$. It is now known to be $3 \cdot 1416$ very nearly.

3. *On Conoids and Spheroids.*—By a *conoid* is meant the solid formed by the revolution of a parabola or hyperbola about its axis. *Spheroid* has the usual meaning. Archimedes here shows that a segment (or part cut off by a plane) of a parabolic conoid is half as much again as its inscribed cone, whether the base be perpendicular to the axis or not, the axis of the conoid being the parallel to the principal axis which passes through the centre of the base; that all segments of the same conoid, having equal axes, are equal; or, more generally, that different segments of the same conoid are as the squares of their axes; how to find the ratio of the segment of an hyperbolic conoid to its inscribed cone; that any spheroidal segment, having the centre of the spheroid in its base, is double of its inscribed cone; and generally, how to compare any spheroidal segment with its inscribed cone. In this treatise is also shown, probably for the first time, how to find the area of an ellipse, by means of that of a circle.

4. *On Spirals.*—The spiral of Archimedes, the method of forming which appears to have been suggested by his friend Conon, is thus made:—a point moves uniformly along a straight line, which straight line itself revolves uniformly about a given point in it. Archimedes shows how to compare the areas described by the moving point in its various revolutions, and various other properties, which the little importance of the subject will excuse us from noticing. As an effort of geometry, it is, however, not inferior to the preceding, and it is one of the most difficult of his works.

5. *Two Books on the Equilibrium and Centre of Gravity of Plane Surfaces.*—The axiom on which Archimedes sets out is, that equal weights suspended at equal distances on opposite sides of a pivot are in equilibrium. He then shows the well-known property of the lever:—given the centre of gravity of a whole plane, and of one of its parts, how to find the centre of gravity of the remainder—how to find the centre of gravity of a parallelogram, triangle, and trapezium. In the second book he shows how to find the centre of gravity of a parabolic segment, or the difference between two segments of the same parabola, having different bases.

6. *Psammites*, better known by its Latin name *Arenarius*.—This is a mathematical toy, but abounds in curious information. It appears from it that Archimedes had written a system of numeration, in a work addressed to one Zeuxippus, resembling that of modern times in having units of different orders carried to a great extent—that he approved of the system which he attributes to Aristarchus, which places the sun immovably in the centre of the universe, instead of the earth—that he was aware of some attempts having been made to measure the earth, which, from their result, as stated by him, could hardly have been those of Eratosthenes—that no instrumental means then existed by which the apparent diameter of the sun could be measured within $\frac{1}{4}$ —and that plane trigonometry was totally unknown at that time. The object of the work is to oppose those who held that the grains of sand on the sea-shore are either infinite in number, or at least cannot be reckoned. By approximately measuring the apparent diameter of the sun, and making arbitrary suppositions as to how many times the real diameter is contained in the earth's distance, and this again in the sphere of the fixed stars, he comes at last to the conclusion that no one will assert the diameter of the sphere of the fixed stars to be greater than 10,000,000,000 of stadia. Then supposing a stadium to be 10,000 finger-breadths, and a sphere, which is

only the 40th part of a finger-breadth, to contain as many as 64,000 grains, Archimedes shows that the number of grains contained at the same rate in the whole sphere of the fixed stars can be expressed, in his system of numeration, by a number which in our system is less than 1 followed by 63 ciphers.

7. *On the Quadrature of the parabola.*—Archimedes here shows that any segment of a parabola is four-thirds of a triangle, having the same base and the same altitude.

8. *Two Books on Bodies floating in a Fluid.*—This work does not exist in Greek, but was translated by Tartaglia from a mutilated Greek manuscript: the first book was published in 1543, and both together in 1545. That Archimedes did write such a work is certain, from the testimony of Strabo (Casaubon, p. 54). These two books contain the conditions of equilibrium of a floating body in general, applied to determine the positions of a spherical segment and of a conoid. It is less necessary to describe this book particularly than any other, because, the use of algebra excepted, it contains all the conditions of a modern work on the same subject.

There is also a book of *Lemmas* attributed to Archimedes, translated from the Arabic in 1659, and republished by Borelli in 1661. Both Archimedes and his commentator Eutocius refer to some such work; but the very common character of the contents of the *Lemmas* has led some to doubt if this was the work in question.

The works of Archimedes are written in Doric Greek, the prevailing dialect in Sicily. The text is for the most part in tolerably good preservation; the style is clear, and has been considered better than that of any of the other Greek geometers. His books are mostly addressed to a friend named Doritheus. The demonstrations are long, but rigorous; and M. Peyrard, in calling Archimedes the Homer of geometry, has made a simile which is perfectly admissible as to the strength of praise it conveys, if in no other point. The commentaries of Eutocius which have come down to us, are those on the *Sphere and Cylinder*, the *Measurement of the Circle*, and the *Equilibrium of Planes*.

We can only briefly touch upon several remaining points. It is known from Ptolemy that Archimedes observed and calculated several solstices, for the determination of the length of the year. He is said to have been the first who constructed a machine for representing the motions of the sun, moon, stars, and perhaps of the planets. The doubt is from Delambre, who does not, however, appear to have remembered that Cicero (*Tusc. Quest.*) says that Archimedes '*lunæ, solis, quinque errantium, motus in sphaera illustravit*.' Pappus cites a treatise of Archimedes on the construction of this sphere, as also does Proclus. A large number of works which have not come down to us is attributed to him, a list of which may be found in Fabricius; particularly a treatise on *Burning Mirrors*, and a treatise on the *Parabola*, published at Louvain in 1548. There is no great evidence in favour of the genuineness of either. The antiquity attributed to him more than forty mechanical inventions among which are the endless screw; the combination of pulleys; an hydraulic organ, according to Tertullian; a machine called the *helix*, or screw, for launching ships, according to Athenæus; and a machine called *loculus*, which appears to have consisted of forty pieces, by the putting together of which various objects could be framed, as which was used by boys as a sort of artificial memory. It is impossible to understand what is meant by such a description. This constant tendency to attribute inventions to Archimedes, sufficiently shows the impression which his name left on posterity.

Among the principal editions of the works of Archimedes we must notice the partial edition of Tartaglia, Venice, 1543; the first complete edition, reviewed by Regiomontanus, accompanied by the commentary of Eutocius: the whole Greek and Latin, Basle, 1544. This last edition does not contain the treatise on *Floating Bodies*, nor the *Lemmas*. Vossius states that the manuscript which had been brought from Constantinople at the fall of that place, was carried into Germany by Regiomontanus. There is also an edition by Commandine, Venice, 1558, containing only part of the works; by Rivault, Paris, 1615, containing the whole of Archimedes in the preliminary addresses and errors, and only the demonstrations being the Latin of Rivault; and in the *Arenarius*, which is complete; this edition much censured by several more modern editors.

tucla and Vossius unite in speaking well of it; by Torelli, Oxford, 1792, the best, perhaps, of all. The last mentioned edition was purchased by the University of Oxford after the death of the editor, and is the only one which contains the various readings. We have also the Latin translation of Borelli, 1661; the paraphrase of Maurolico, 1570, the whole edition of which was lost by shipwreck except one or two copies, and which was reprinted in 1681; the abridgment of Barrow, in 1675; and finally, the French translation of Peyrard, Paris, 1809, undertaken at the request of the Institute, and revised by Delambre, being, for public use, by much the most convenient version which has yet appeared. A German translation of all the works of Archimedes, by Ernst Nizze, appeared at Stralsund in 1824, in 4to.

Montucla cites the following lives of Archimedes: Mazuchelli, *Notizie Storiche alla Vita, &c., d'Archimede*, 4to., 1735; and an unfinished work of M. Melot, *Mém. de l'Acad. des Belles Lettres*, vol. xv.

ARCHIPELAGO is the common term given to many clusters of islands: the group generally known by this name, when not qualified by some word prefixed, contains those islands which lie between the shores of Greece and Asia Minor. There are, however, other groups so called in our charts, the principal of which are the Aleutian, Chagos, Sooloo, Dangerous, Queen Adelaide's, Corean, Louisiade and Solomon's, the two last forming part of Polynesia. The origin of the term Archipelago appears rather doubtful: the second part of the term certainly is *pelagus*, the sea, a Greek and Latin word; and the first part is possibly a corruption of *Ægeum*. [See **ÆGEAN SEA**.]

ARCHIPELAGO, ALEUTIAN, or Fox Islands, an extensive group on the N.W. coast of America. [See **ALEUTIAN ISLANDS**.]

ARCHIPELAGO, CHAGOS, in the Indian Ocean, extends from the south end of Diego Garcia (or Chagos) Island, in 7° 29' S. lat., to the north end of Speaker's Bank, in 4° 40' S. lat., and from the meridian of 71° to 77° E. It is composed entirely of coral islets, of which Diego Garcia is the largest: they have all very deep water close to them, and are covered with tall cocoa-nut trees. These islands abound in land-crabs, green turtle, and have a plentiful variety of fish; fresh-water may be had by digging eight or ten feet deep. There is a port in Diego Garcia, which, however, is difficult of access. The tide rises from six to seven feet, and the current generally sets through the group to the N.W.

ARCHIPELAGO, DANGEROUS. This appellation has with good reason been given to a group of half-formed islets in the South Pacific Ocean, lying eastward of the Society Islands, and between the parallels of 14° and 26° south. They are exceedingly numerous, and probably many yet remain undiscovered; they are nearly all of coral formation, and consist of narrow ribands of coral rock, generally describing a circular figure, and inclosing a lagoon, in many instances of great depth. These ribands rarely exceed an elevation of ten feet above the sea, and half a mile in breadth; they all have the pandanus, and some the cocoa-nut tree on them. The eastern side is universally the better formed, and covered with vegetation: this is owing to the westerly current caused by the trade-wind, which deposits all floating substances, among which are the seeds of trees, on the eastern side of the island.

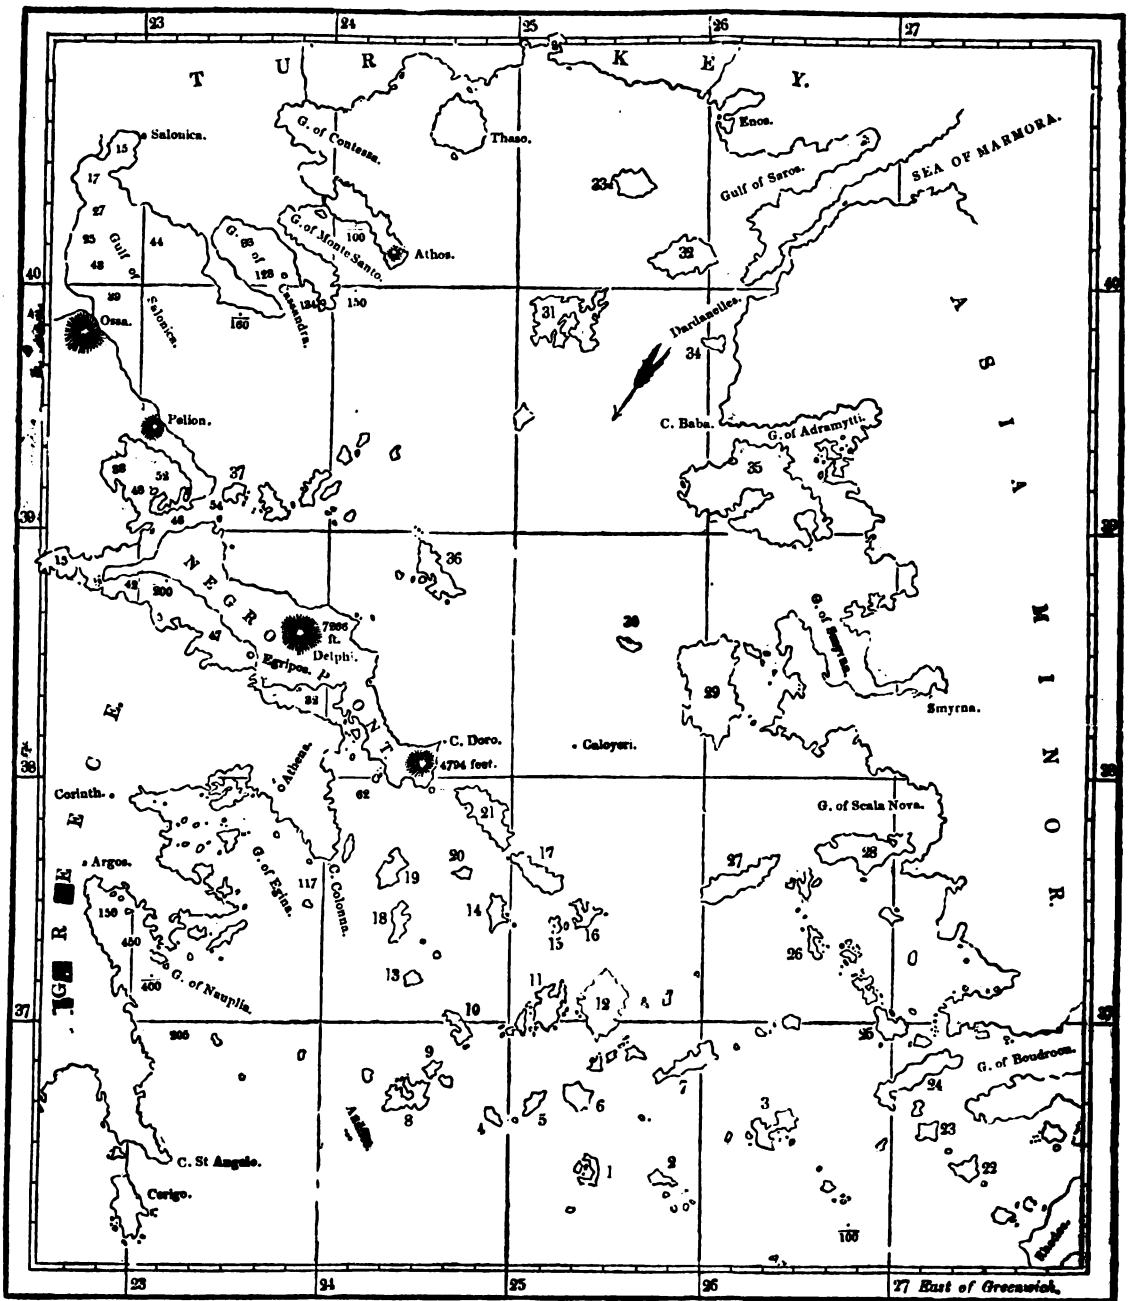

Salas Rock, Pitcairn Island, and Gambier's Group, are volcanic; and it may be presumed that the same convulsions of nature have given the little zoophyte a foundation on which to erect his stupendous structure. One island (Elizabeth) has attained a height of seventy or eighty feet, is formed of compact coral, and well covered with such stunted vegetation as may be expected from the absence of good soil. It has no lagoon; occasionally instances occurring of small islands without one, though rarely. The surf, which breaks violently over them on all sides, is the best safeguard for ships; in the night it may be heard from six to eight miles off, and is frequently seen by day before the island itself, unless the island is well covered with trees. Half a mile from the reef the sea is fathomless. The western sides are, as we have remarked, always less perfect, and some admit of a passage for ships into the lagoons, which become safe harbours. They all lie within the range of the S.E. trade-wind, which however prevails nearly east, but in the winter months there are frequent and heavy gales from the westward. Fresh-water may be obtained by digging in the sandy beach. Many are inhabited, though evidently not by the

same race. Canoes driven off the Society Islands have been the means of peopling some. There is a tide-rise of from three to three and a half feet, but the surf prevents the direction of the tide from being ascertained. Plovers, ringdoves, curlews, and sandlings, terns, tropical birds, and gannets are found among them; and the specimens of shells are various and beautiful.

ARCHIPELAGO, GRECIAN, includes all the islands situated in the north-eastern quarter of the Mediterranean sea; they are bounded by the shores of Roumelia (a province of Turkey in Europe, partly corresponding to the antient Thrace) on the north, Asia Minor on the east, and the Negropont and Greece on the west, comprising a portion of sea which lies in the direction of N. by W. true, with a length of 380 (statute) miles from Candia to the coast of Roumelia, and a breadth, from the Negropont to the Asiatic shore, of 100 miles.

This sea was called by the Greeks and Romans the *Ægean Sea*, and the islands were distributed into two chief groups: those to the westward, now considered as part of Europe, were called Cyclades, from their being supposed to lie in a somewhat circular form; the smaller and more southern islands along the Asiatic coast obtained the name of Sporades, or 'scattered islands.' Of the Cyclades the principal are—Santorin (1), Anaphi (2), Stanpalia (3), Policandro (4), Sikino (5), Nio (6), Amorgo (7), Milo (8), Argientira (9), Siphno (10), Paros (11) with the small island of Antiparos near it, Naxia (12), Serpho (13), Syra (14), Rhenea (15), Miconi (16), Tino (17), Thermia (18), Zea (19), Jura (20), and Andros (21). Of the Sporades the principal are—Piscopi (22), Nisari (23), Cos (24), Calymna (25), Patmo (26), Nicaria (27). There are also on the Asiatic coast the large islands of Samos (28), Scio (29), and Psara (30). Farther to the northward are Lemnos (31), Imbros (32), Samothraki (33), Tenedos (34), Mitilin (35), Skyro (36), and the Skiathos (37) group off the Trikiri Channel. Many of these islands are of volcanic formation; others are composed almost entirely of a pure white marble, of which the Parian, from Paros, where it was formerly most worked, is often mentioned by antient writers. They exist almost in countless numbers; some are beautifully fertile and picturesque, though all the smaller islands are mere masses of rock, almost entirely destitute of vegetation. The productions of the islands are wine, oil, gum-mastic, raisins, figs, silk, honey, wax, olives, and various fruits, especially the lemon and orange: cotton is grown in small quantities at Milo and other islands, and might be cultivated to a great extent. It is remarkable for its brilliant white hue. Some of the larger islands contain sulphur, alum, iron, and other minerals. An extensive sponge fishery has also long been established among the Sporades, which are noted for their fine sponges. The arts and manufactures are at so low an ebb, that commerce is confined chiefly to the interchange of articles of daily consumption, and is carried on principally in small kaïks, in which the inhabitants push across from one island to another, certain of always being able to reach a port in the event of being overtaken by bad weather. These kaïks are open boats, sharp at each end, and carrying one large spritsail, part of which is always dragging in the water.

All the islands are thinly peopled, and some indeed may scarcely be considered inhabited. As their religion imposes on the people four lents a year, when meat may not be eaten, fish becomes more a necessary than a luxury, in consequence of which a large portion of the men are employed as fishermen. There are, however, no regularly established fisheries; the supplies are obtained by any who think they can make a livelihood by fishing in their small boats; nets are most commonly used, and the fish caught are chiefly bream and mullet, both red and grey, which are large and well flavoured. The men are a fine, hardy, and athletic race, and as their insular position renders them necessarily habituated to the sea, they are justly considered good sailors. Their dress consists of a short jacket and waistcoat, without a collar, very full breeches, with a red sash round the waist, a small red cap fitting close to the crown of the head, and shoes resembling our slippers: the legs and throat are generally bare; they wear moustachios, but never beards, and though they do not shave the fore part of the head, like the Albanians, yet the hair is made to lie back, and falls down the neck to a great length. The women are generally considered beautiful; in no part of Greece does the character and expression observable in the face of the

[The figures attached to the islands refer to the list in p. 279: the numbers which stand alone denote depths in fathoms; and 400, for instance, denotes no bottom with 400 fathoms.]

ancient statues so decidedly show itself, and especially among the Cyclades. The women's dress is very simple; the only peculiarity being a long jacket, generally trimmed with fur, and a red cap. When not employed in their household occupations, which are laborious, their time is taken up with spinning cotton, and knitting, or weaving.

Their religion, like that of their countrymen on the mainland, is of the established Greek church; and as they are very superstitious, almost every point of their islands has its little chapel dedicated to some saint, where the boatmen can offer up their prayers or thanksgivings. In many of the islands, however, Catholics are numerous. The difference of faith provokes much jealousy and hatred, and it is notorious that during the late war for independence, the Roman Catholic portion of the islanders inclined rather to the Turks, than to their own countrymen of the Greek church. This was more particularly the case at Tino and Miconi.

The mode of threshing is still that mentioned in Scripture—treading out the corn by oxen yoked together and driven round a circular enclosure.

All the islands are high: the mountains have an average

elevation of 1500 to 1800 feet, but Mount Elias of Milo rises to the height of 2036 feet above the sea. Many of the islands exhibit, in the remains of antiquity yet visible, traces of their former prosperity and importance.

The climate is more equal and temperate than that of the surrounding continents, the heats of summer being tempered by cool refreshing sea-breezes and prevailing northerly winds; even in the more northern islands the winter is never felt with such severity as on the neighbouring mainland. The N.E. or Etesian winds, called by the fishermen 'Meltem,' a corruption probably of *mal tempo*, blow with great fury, especially about the equinoxes; the general period of their duration is three days. The true scirocco, with its oppressive state of atmosphere, does not blow in the Archipelago; and it is curious to observe the sea-crests taking the direction of the various gulfs and inlets though differing several points in bearing. In winter the navigation of these seas is, to say the least, an anxious task, on account of the numerous islands and rocks, which occasion sudden flaws and eddies of winds, and a short, confused sea. A remarkable feature is the very great depth

of water: at the distance of less than a mile from the shore there is generally no bottom with 150 to 200 fathoms of line. The Ananes rocks, 10 miles south-west of Milo, and the Caloyeri, 30 miles west of the south point of Scio, rise up almost perpendicularly, like the coral reefs of the Southern Ocean. Throughout the Cyclades more especially, the Dardanelles current is felt, and sets strong through the narrow channels between them; but to the north, along the coast of Roumelia, a kind of back current sets to the eastward.

The rivers that empty themselves into the Archipelago are more deserving of notice from their classical associations than from their magnitude or commercial importance; indeed the south-western shores offer no river navigable even for small boats. On the coasts of Thessaly, Macedonia, and Thrace, however, the Peneus, the Axios, the Strymon, and the Hebrus, admit the larger class of kaïks, though in all of them the mouths are much obstructed by shoals and deltas of low islands. On the Asiatic shore, the Hermus and Mæander are the chief rivers. The coasts around the Ægean are deeply indented with gulfs of considerable length, the principal of which are Nauplia, Egina, Egripos, Trikiri Channel (leading to Zeitouni and Tallanda), Salonica, Cassandra, Monte Santo, Contessa, Saros, Adramytti, Smyrna, Scala Nova, Hassan Kalessi, and Boodroon (or Cos). Some of these are separated from each other by remarkable peninsulas, especially those of Pallene, Sithonia, and Athos, which last is perhaps the boldest promontory in the world: the steep and almost inaccessible sides of the mountain descend abruptly into an unfathomable sea. [See *ΑΘΟΣ*.] Among the chief mountains in or near the Ægean may be noticed Delphi in Eubœa, the mountains bordering on the coast of Thessaly, Athos, and Elias in the island Milo.

On the division of the Roman empire the islands formed a portion of the eastern dominion, and continued so till the year 1185, when the Venetians captured Andros, Lesbos, Samos, and Scio, in revenge for an attempted aggression of the Emperor Alexius on the territories of the republic. In 1207 an edict was issued at Venice, authorizing the nobles to equip armaments for the reduction of portions of the empire. Several of the islands were thus taken possession of as private estates by the victorious adventurers; the most celebrated among whom was Marco Sanuto, who in the same year made himself master of the island of Naxos, with the title of Duke of Naxos. Having added to his conquest the islands of Paros, Antiparos, Santorin, Anaphi, Argentiera, Milo, Sipano, and Policandro, he asserted his independence of Venice, and assumed the more comprehensive title of Duke of the Archipelago.

Some of the other islands were occasionally recaptured by the Greeks, but this dynasty continued uninterruptedly in the same family for a period of nearly three centuries, till Naxos fell into the hands of Barbarossa, who, after sacking the island, allowed John Crispo, the then reigning duke, to retain his dominions on condition of becoming a vassal to the Porte. Barbarossa plundered the other islands which still remained appanages of Venetian noblemen. In 1566, James, the twenty-first and last duke, having become a prisoner in the Seven Towers, a governor was appointed by the sultan, and all the islands then became united under the dominion of Solymán. It is singular that no one institution worth recording, and no monument of art, remain to preserve the remembrance of the long period of the ducal government.

In 1686, Morosini again laid some of the islands under temporary contribution to Venice, though they were never again detached from the Ottoman dominions. The islands were, however, entirely freed from the Turkish presence by the expeditions of the Knights of Malta, who, making frequent descents, carried away into slavery all the Mussulman residents, so that the Porte withdrew its governor and officers, leaving them in a manner independent, and masters of the land, subject only to a tribute levied as land and capitation taxes. For this purpose the captain pasha, to whose pashalik most of the islands belonged, used to make an annual tour with the fleet in such force as to keep the knights in awe, and enforce the speedy collection of the taxes.

The government taxes of Candia, Cyprus, Cos, Imbros, Lemnos, Mitilin, Tenedos, and Thasos, were set apart for members of the imperial family; Nicaria and Samos, for the mufti; Andros, Tino, Scio, and Syra, for other officers of the divan. In 1770, the Russians became masters of some of the

Cyclades, which they evacuated by treaty four years afterwards. They remained tributary to the Porte till the breaking out of the revolution in 1821, shortly after which most of them eagerly embraced the cause of liberty, and contributed as much as lay in their power, both by men and ships, to the squadrons fitted out at Hydra and Spezzia. Their intrepid behaviour in their small vessels against the Turkish fleet became the admiration of Europe, and contributed greatly towards the establishment of their national independence.

All the Cyclades are now a portion of the Greek kingdom, but most of the other islands still remain under the Turks. In many of the islands they build vessels, and in Syra, more particularly, there is a large establishment for ship-building; their fir plank is imported chiefly from Trieste. Their models are beautiful, but being hurriedly and slightly put together, often with unseasoned wood, their vessels do not last long. The polacca rig is universal.

ARCHIPELAGO CARIBBEAN. [See *ANTILLES*.]

ARCHIPELAGO, COREAN, an extensive cluster of islands on the western coast of Corea, discovered by the Alceste in 1816. They are all high, rising like mountains from the sea, and are well wooded to the summits. None of them appear to exceed three or four miles in length, but all are in some degree cultivated; the fields are divided by stone walls. From the tops of one of the highest 135 islands were counted, forming a chain of excellent harbours communicating with each other. They appeared to be all inhabited, and the natives resembled those of the mainland of Corea; they cultivate corn and feed cattle for their own consumption, but subsist chiefly on fish; no weapons were observed among them. The rise and fall of tide is considerable, but among so many islands the direction must of course be various. They extend from 34° to 36° 45' N. lat., and from 125° to 127° W. long. (Hall and McCleod.) [See *COREA*.]

Besides these there are many groups of islands to which the term Archipelago is applied by some geographers; thus all the islands to the north and east of Madagascar, from Bourbon to the Seychelles, and from Rodriguez to the main, have been classed under the denomination of the Ethiopian Archipelago. On the N.W. coast of America are small clusters, called George Third's, Prince of Wales's, and Pitt's Archipelagos [see *COOK*, *VANCOUVER*, *PEROUSE*], and on the western coast of the Birmese empire, near the Andamans, are two chains of small barren islands, called the Mergui and Tanasserim Archipelagos. The term has also been applied to the Philippines and many other groups. A list of twenty-six groups called Archipelagos is given in the *Encyclopédie Méthodique (Géographie Physique)*, most of which, such as the Azores, Canaries, &c., are as properly called Archipelagos as those here noticed; but as they are generally known by other special names, and not by that of Archipelago, we prefer describing each group under its ordinary appellation.

ARCHIPELAGO, GREAT CYCLADES, a group of large islands in the south Pacific, so called by the French navigator Bougainville; they received from Cook the name of New Hebrides, by which they are now generally known. [See *NEW HEBRIDES*.]

ARCHIPELAGO, LACCADIVE, a group of low islands, opposite the Malabar coast, and separated from it by a channel 135 miles wide. They are surrounded by and interspersed with coral reefs, which are steep, with no soundings between them. Some of the islands are well inhabited and afford good fresh water; they abound in turtle, and are so low, that at a small distance the trees only appear visible above the water. There is a rise of tide of about six feet, but the tides are not regular, and the currents are very strong: the largest island is about six miles long and one broad. To the northward of the group is an extensive coral bank of twenty-five to thirty fathoms, also steep. It lies nearly N. and S., about sixty-five miles in length and very narrow. The extent of the chain is from 10° to 12° 20' S. lat., and 72° 0' to 74° 20' E. long. (Horsburgh.) [See *LACCADIVES*.]

ARCHIPELAGO, LOUISIADE, a range of islands to the S.E. of New Guinea, about 400 miles in length, and 160 at its greatest breadth. The largest islands do not exceed thirty miles in length; they are very high and are covered with wood from the summit to the shore. They are surrounded by and interspersed with coral reefs and islets, which are covered with cocoa-nut trees; these reefs are steep, like all others of the same formation. The current sets through the channels to the N.W. at the rate of about half a mile an

hour. Some of the islands are populous and fertile, but the natives are warlike and treacherous, and are supposed to be cannibals: they are of middling stature, of a copper colour, with woolly hair: they tattoo, and go nearly naked, but are fond of personal ornaments. The islands appear to abound in aromatic plants, as most of the articles obtained from the natives were highly scented. Their canoes, some of which are fifty feet long, have their stems and sternposts prolonged to a great height; they carry outriggers and sails, and have two rudders. In battle the natives use slings chiefly, but also darts and tomahawks, and a wooden shield for defence. The group is contained between $9^{\circ} 45'$ and 12° south lat., and $148^{\circ} 50'$ and $154^{\circ} 40'$ east long. (Bougainville, Cook, &c.)

ARCHIPELAGO, MALDIVE, in the Indian ocean, to the S.W. of Ceylon, a chain of innumerable low islands and rocks, extending about 470 miles nearly on a meridian line. The large islands abound in cocoa-nut trees, and are generally inhabited by a race of Hindoos, but most of the other islands are mere barren rocks and sand banks. The greatest breadth of the range is about twenty leagues; it is formed of large groups or clusters, called by the natives Atolls. An Atoll is a bank rising from an unfathomable depth on which islands and rocks are situated; these prevail generally round the margin of the bank, though many exist within the area thus formed, that is, the islands themselves do not rise from the great depth, but are based on the sand-bank, which affords anchorage within the area. There are thirteen large Atolls from five to ten leagues in diameter, with several other detached islands and rocks in the channels that separate them: some of the channels are wide and safe, having no soundings till close to the reef, but within the reefs there is a moderate depth of water fit for anchorage. The currents set strong through the channels with the prevailing monsoon. The native boats, taking advantage of the monsoon, trade to Bengal in coir, cowries, &c., and return with rice, sugar, and piece goods. The geographical position is from lat. $7^{\circ} 6' N.$ to $10^{\circ} 40' S.$, long. $72^{\circ} 48'$ to $73^{\circ} 48' E.$ (Horsburgh). [See MALDIVES.]

ARCHIPELAGO, QUEEN ADELAIDE'S, on the S.W. coast of Patagonia, lies between Lord Nelson's Strait and the northern entrance to the Strait of Magalhaens on the western side. These islands are separated from the main land by an intricate channel, varying from two to five miles in breadth, called Smyth's Channel. They consist of numerous elevated islands with sharp rugged peaks and serrated ridges, separated by narrow and deep passages. Sir John Narborough touched here in 1670, and the S.W. island of the group still bears his name. This Archipelago is at present under examination; it is contained between $51^{\circ} 50'$ and $52^{\circ} 42' S.$ lat., and $74^{\circ} 07'$ and $75^{\circ} 10' W.$ long.

ARCHIPELAGO, RECHERCHE DE L', a very scattered and intricate labyrinth of reefs and islands on the south coast of New Holland. The largest island does not exceed four miles in length: they are all barren and arid, producing little vegetation, and nothing esculent. They have attained some elevation from the accumulation of sand, like the opposite coast, the approach to which is thus rendered dangerous. Wood and water, both in small quantities, may be procured on some of the islands; penguins, seals, and sharks are very numerous; the only quadruped seen by those who have visited the spot is the kangaroo. This group was so named by D'Entrecasteaux in 1792, when in search of La Perouse: the largest and the western portion of the islands lies off the bay of Espérance; the rest lie scattered to the eastward. The whole are included between the parallels of $33^{\circ} 45'$ to $34^{\circ} 0'$ south, and meridians of $121^{\circ} 35'$ to $124^{\circ} 4' E.$ (*Australian Memoir*; D'Entrecasteaux's *Voyage*.)

ARCHIPELAGO, SOLOMON'S, a chain of large islands, east of New Guinea, some of which are sixty miles in length; they are very high, and thickly wooded from the summit to the beach; they appear to be but thinly inhabited by different races, some very black and others copper-coloured; the former have soft woolly hair, the latter long and black; most of them cut it short round the crown. The men tattoo their bodies, and both sexes paint their faces; the ears are pierced and the orifices distended by rings of different kinds, and an ornament is also worn through the septum of the nose. Both sexes go entirely naked, except a scanty girdle round the waist. In war they use bows and arrows, spears and clubs; shields made of wicker-work are also used as a defence. Their canoes are skilfully constructed of pieces

neatly joined together; the head and stern are high, and in general ornamented with mother-of-pearl; some of them are between fifty and sixty feet in length, and about four wide. The inhabitants are treacherous, and said to be constantly at war with the neighbouring islands; they are supposed to be cannibals.

The group was first discovered by Alvaro de Mendana in 1567, and was again visited by M. de Surville 200 years after, but, like the greater part of Polynesia, they have never undergone a survey, though frequently touched at by vessels during the last fifty years. Nothing is therefore known of their government, religion, or customs; the wild boar appears common, with loories, cockatoos, and aquatic birds: there are also large snakes and a peculiarly large ant. Their geographical position is from lat. 5° to $11^{\circ} S.$, long. $154^{\circ} 40'$ to $162^{\circ} 20' E.$ They lie parallel to the Louisiades in a N.N.W. direction, and are about 240 miles distant from that Archipelago. (D'Entrecasteaux.)

ARCHIPELAGO, SOOLOO, a group of islands, about sixty in number, lying between the S.W. point of Mindanao, and the N.E. point of Borneo, and consisting of some large islands, especially Sooloo, Beca, and Basseelan, with many smaller ones, and coral reefs so numerous as to render the navigation of the group very dangerous. All the islands are subject to a rajah, who resides at Sooloo town in the island of that name, which is thirty miles long, twelve broad, and contains about 60,000 inhabitants. The islands are generally high, and there are several good harbours; bullocks, poultry, and other live stock, with fruit and vegetables, may be had in abundance; but the natives are treacherous, and small vessels should be on their guard against attacks. The group is comprised between lat. $4^{\circ} 30'$, and $7^{\circ} 0' N.$, and long. $118^{\circ} 30'$, and $122^{\circ} 30' E.$ See Sooloo (Horsburgh).

ARCHITECTURE is sometimes defined to be 'the art of building.' We shall presently examine in what sense this definition ought to be explained, and how it ought to be limited.

The Greek term for architect is ἀρχιτέκτων (*architectōn*), which we find employed by Herodotus (iii. 60.) in the same sense as the word *architect* now is: he informs us, that Rhoecus, a Samian, was the *architectōn* or architect of the great temple of Samos. We thus learn from positive testimony, that before the great buildings of Athens were erected, the term architect and the profession of an architect were distinctly recognized among the Greeks. But Herodotus also uses the word *architectōn* in the passage just referred to in another sense: he applies it to a person who made a tunnel by which the city of Samos was supplied with water; and this is an instance in which *building*, or *construction*, properly speaking, can hardly be said to have been employed. The great increase in works of this class in modern times has led to new designations, such as that of civil engineer, which we apply to those who construct artificial ports, roads, railways, tunnels, &c.; and though the engineer may often have occasion to *build*, and may also with propriety *decorate*, common usage has placed a determinate boundary between civil engineering and architecture.

In ascertaining the present meaning of terms, it is sometimes useful and often necessary to ascend to their primary signification, and to trace their historical progress. The Greek word *archi-technōn* signifies the chief *fabricator* or *maker*; and the word *technōn* itself (τέκτων) appears to mean, originally, a *worker in wood*, a *carpenter*, a *house-builder*, a *ship-builder*, &c. (See *Iliad*, xv. 411; xxiii. 712; *Od.* xvii. 384.) It is not, however, limited to those who were skilful in the working of wooden materials, but when coupled with a qualifying term (as in *Il.* iv. 110; *Hymn to Venus*, l. 12) it had a more extensive signification. We believe that a fair examination of the earliest uses of this word will lead to an opinion that it signified *primarily* 'a worker in wood'; and consequently the Greek term *architectōn*, and the Roman *architectus* (which is a borrowed word with a Latin ending), would properly signify the *chief-carpenter*. It seems to be a fair inference, that this primary signification of the Greek word should have reference to the *materials* first employed in construction; and it appears to confirm the opinion, which is established by other independent considerations, that the *architecture* of the Greeks derived its origin from a construction in wood.

It is impossible to assign an exact meaning to the term *architecture* by any short definition. Architecture is not merely the 'art of building,' or of working materials of

earth, timber, or stone, into the form of mounds, huts, caves, and walls. Thus we do not admit such mounds of earth as that of Alyattes [see ALYATTES], or of Silbury Hill near Marlborough, to possess an architectural character. Neither are the kraals of the Hottentot, nor the rude huts of other nations, entitled to this name, though such habitations undoubtedly have in each nation a particular and a tolerably uniform style of construction.

An excavation in a rock is not an architectural work, unless it possess a certain symmetry and certain ornaments which characterize other similar works, so as to enable us to refer it to some class or kind of construction. Where such instances of excavations occur, the ornamental or architectural part is obviously only the copy of models in wood or stone previously erected on the earth. Such is the character of the rock temples of Elephanta, and the rock-cut tombs or temples in Nubia. The rude Pelasgic or Cyclopien walls of Tiryns in the Peloponnesus, and other similar structures in Italy, possess a distinctive character, which is seen in a more advanced and improved state in the military fortifications of Mycenæ, where we find also the oldest instance, as far as we know, now existing in Europe, of a construction in stone combined with the sister art of sculpture. We refer to the sculptured figures in high relief, commonly called lions, which stand over the great gateway. But neither are these buildings included in the term architecture, as we shall proceed to show.

The existing monuments in Great Britain which are supposed to be anterior to the Roman invasion of this island, are classed, whether correctly or not we shall not here inquire, under the general term of Druidical or Celtic. The most remarkable of these monuments, both for preservation and arrangement, is Stonehenge on Salisbury Plain in Wiltshire. Here we find stones, some of very large dimensions, placed upright in the ground, and forming a series of concentric circles. They are not merely rude masses, like those of Avebury near Silbury Hill, but they have evidently undergone some shaping and rubbing down so as to form tolerably regular parallelopipedons. We here observe also two stones placed upright, like posts or pillars, and another large stone placed over them like an architrave or lintel: the lintel is also secured by means of mortises and tenons: all this indicates certainly a regular principle of construction. But, with the exception of a few inquirers who are, perhaps, disposed to over-value Celtic remains, can any careful antiquarian trace the forms of our oldest churches and other ancient edifices, to the rude masses of the British monuments in this island? It is an historical fact, that the Romans introduced into England their own principles of building; and it is equally demonstrable that, with the exception, probably, of the arch, Roman architecture, as it is known to us, both from existing specimens and written books, is a modification and adaptation of Grecian architecture; it was probably introduced among the Romans by Greeks, and certainly generally practised by them even under the emperors. [See APOLLODORUS.] If we then trace the progress of architectural construction from the Greeks, through the Romans, to its introduction into western Europe, we may fairly assert that the term *architecture*, in its strictest sense, implies the adaptation of Grecian models to the buildings of our own times.

A building may be well arranged for all purposes of mere convenience, but in this case it is not an architectural construction. The progress which the arts have made in modern times has taught us to combine internal convenience and fitness with beauty of external form, and with durability. If the external arrangement of a building should be compounded of those of several nations, such as Hindoo, Egyptian, and Greek, we should not admit this to be an architectural construction, even if the external form gave pleasure, which, however, is hardly a possible result; for it is essential to the character of an architectural structure, that the general arrangement and ornaments should have a unity of character and be referable to some one model.

We have endeavoured briefly to show, what we believe to be strictly demonstrable, that the term architecture, *historically* explained, is the mode of constructing edifices which we have received from the Romans and the Greeks. But with the establishment of Christianity, and its diffusion over western Europe, a gradual modification was made in the forms of buildings devoted to religious worship: for it must be observed that it is principally in the religious edifices of a nation that we find the essential principles of its architecture

exhibited and preserved. This remark applies with equal truth to all nations that have left behind them examples of some definite style of building. The great ecclesiastical structures of western Europe now exhibit a character in appearance very different indeed from the models of Greek and Roman buildings. They gradually deviated from the heavy and rounded Norman arch, the type of which is undoubtedly the Roman arch, to the pointed and light constructions generally denominated the Gothic. That foreign ornaments of a barbarous or at least incongruous style, were occasionally mingled with them by the numerous architects of the middle ages, cannot be denied; but still in the early ecclesiastical and also in many of the civil structures of Germany, France, Flanders, and England, a distinct and new character of architecture may be seen.

This distinction became again so marked in the several countries of Europe, that a very competent judge (Rickman) is of opinion that the Gothic or pointed styles of England, and various continental countries, have each a separate character, though they may all have had a common origin. The observation of Mr. Rickman has accordingly led him to assign to English architecture a distinct character and history. As England, then, possesses an architecture of her own in the numerous ancient structures that adorn the country, and as the principles of Greek and Roman architecture have, especially within the last twenty years, been more carefully studied, and their general character and details more extensively diffused, we may reasonably expect that all our new public structures will not only be constructed with reference to their use, but that in their external design and the ornamental parts we shall adhere to some one of the great models.

The architecture of a people is an important part of their history. It is the external and enduring form of their public life, it is an index of the state of knowledge and social progress. Some speculators, indeed, would regard the noble monuments which decorate our own country, only as the marks of slavish submission to a hierarchy. But it may safely be asserted that the progress which man has made in the arts is mainly due to the influence of religious systems; and that the great improvements which have thus been gradually effected have at last descended to the humblest dwellings.

We have considered that the architecture of a country is inseparable from its history; and it is for this reason, among others, that we propose the subdivision, which the reader will see at the end of this article. A few remarks, however, may not be inappropriate on the supposed origin of the forms of architecture, and here we speak with reference to that of the Greeks. Whatever connexion, or rather resemblance, there may be between Greek and Egyptian, and between Egyptian and Hindoo architecture, will be most appropriately discussed under those separate heads. It is difficult to conceive that a Greek temple is any thing else than the improved and decorated form of a wooden construction. That wood would be used for the ordinary construction of dwellings, before baked clay or stone, seems natural, because it is more easily worked and more readily adapted to any required form. A rude cabin with its upright posts, its horizontal cross timbers, and its roof of wood, presents enough as a basis. A rectangular chamber for the inmates, a portico to screen them from the sun, posts to support it, with sloping roofs to carry off the rain, present all the essential elements of a Greek temple. Such an edifice, probably, was the ancient wooden temple of Neptune, in Arcadia, which tradition attributed to Agamedes and Trophonius. This venerable monument of antiquity was preserved by the care of the emperor Hadrian, who ordered it to be cased with a new edifice. (Pausan. *Arcad.* 10, 2.) In the *agora* or public place of Elis, the same traveller saw a curious structure in the shape of a temple, but without walls; the roof was supported by columns of oak. An old man told Pausanias that it was the tomb of Oxylyus. (6. 24.)

In opposition to this hypothesis, for it is not a matter which admits of proof, it is alleged, that we do not find barbarous nations, who use wood or sticks for their huts, adopting a construction such as we have described, and that in none of them do we trace these supposed elements of Greek architecture. The wonder would be if we did find a *barbarous* nation possessing these elements of knowledge, for a nation that had them would soon cease to be barbarous. But *all* nations have not an architecture of their own, nor have *all* nations a style of sculpture of their own, nor do *all*

[Temple of Neptune at Paestum in Italy.]

nations possess the power of forming geometrical figures and reasoning on their properties; and yet all these are the essential elements of architecture. For reasons which we cannot understand, the same faculties are not given to all the children of men: to some races is given the power to invent, to others a capacity to receive the inventions of others; but to some is denied the power of even receiving and adapting what others have invented.

Though we conceive, then, that Grecian architecture arose from the rude fabric of a wooden dwelling, we do not conceive that the edifice of stone attained either the beauty of proportion or the richness of ornament, till it called in the aid of sculpture. *Building*, that is, the putting together of timber frame-work, may be older than sculpture, but sculpture combined with building produced architecture. From the Homeric poems we deduce only very vague ideas as to the structure of temples and palaces; we find no distinct indication of the arrangement of columns, which are the very essence of Greek architecture. But the arts of design, and even the arts of working in metal, had attained some excellence. (See in the *Iliad*, book 18, the description of the shield of Achilles.) We find epithets derived from metal applied to the house of Alcinoüs and other buildings, from which we infer that they were structures of wood, and that the decorations were of metal; but we find no trace of columnar arrangement, or of an edifice of stone. (*Odys.* vii. 84, &c.; iv. 45. &c.) Even in the time of Pausanias (x. 5. 11) there still existed at Lacedæmon the temple of Minerva, called the 'house of copper,' from which it would appear, that this and other antient temples were mainly of wood, and ornamented with metal.

That the oldest material of sculpture was wood, is a fact in itself probable enough, and attested by the authority of Pausanias (viii. 17). Many of these wooden statues of high antiquity remained after the wooden temple itself had been exchanged for a more substantial edifice of stone.

We believe, then, that Grecian architecture was only the improved and decorated wooden edifice, and that the ornamental parts of the stone structure, even in their simplest form, were derived from the art of the sculptor. The sculptor and the architect, in fact, were often united in the same person; and even when it became usual to separate these arts into two distinct branches, we can have no doubt that the skill of the architect, and the taste, at least, of the sculptor, were generally combined in the same individual. We believe this was the case also with the old cathedral architects of England, who frequently not only adapted the exterior forms of their edifices for the reception and display of sculpture, but had good taste enough to take care that

these ornaments were in harmony with the whole design, and worthy of the edifice which was to receive them. Specimens of sculpture of great excellence may be observed on the exterior of many of our cathedrals: for instance, on the west end of Salisbury cathedral.

In attempting to discover what was the model of the wooden construction which we have assumed to be the parent of the architectural edifice, we meet with a variety of theories which are unsatisfactory. But it seems to have escaped the observation of many writers, that the nation to which Europe is indebted for the elements of its architecture is also the nation to which we are indebted for our knowledge of geometry. That law of the mind which gave birth to the simple forms of the triangle, the circle, and the square, gave to man the elements of all his works of art. We are not aware of any nation that has had a system of architecture which has not also had a style of sculpture; nor do we know of any nation that has carried architecture to perfection, or even to a degree of excellence in its kind, that has not also had a system of geometry and arithmetic.

Without such an extension of these general remarks as would interfere with the details belonging to the separate heads into which the various styles of architecture are divided, we could not attempt to bring down the history of the art to our own days, and trace its various stages of application in the public and private edifices of our own and other countries. We have therefore only to mention that the terms of architecture must be sought under their respective heads, as ARCH, ARCHITRAVE, &c.; that the general principles of construction will be found under BUILDING, and of architecture, as a fine art, under PROPORTION; and that the more important styles and æras of architecture will be thus distributed:—

BABYLONIAN ARCHITECTURE	ITALIAN ARCHITECTURE
CELTIC	MEXICAN
CHINESE	MOORISH
EGYPTIAN	NORMAN
ENGLISH	PELASGIAN
ETRUSCAN	PERSEPOLITAN
GOthic	PERUVIAN
GREEK	ROMAN
HINDOO	

The principles of military architecture will be treated of under CASTLE, and FORTIFICATION; those of naval architecture under SHIP; and the most approved principles of domestic architecture under HOUSE.

ARCHITRAVE, from a Greek word and a Latin one meaning, when put together, *the principal beam*, is the lower

[Part of the west front of St. Paul's Cathedral.]

part of any structure supported by pillars, or the lower beam which rests upon the columns and joins them together, on which the whole entablature (or ornamental part which comes immediately above the columns) rests. It was also called by the Greeks and Romans *epistylon*, or *that which is on the columns*. Thus, when pillars support an arch, the voussoirs (see ARCH) supply the place of an architrave, by which name they are sometimes called. In the same way the flat-beam, or row of stones coming immediately above a door or window, is called the architrave. The architrave may have only one face or two, that is, may appear as one beam, resting on and joining the contiguous columns (see the temple of Pæstum), or as two beams, the upper of which projects a little in front of the lower, as at *a* in the preceding cut. The proportions, &c., will be described under the heads of GREEK and ROMAN ARCHITECTURE.

ARCHIVE, or ARCHIVES, a chamber or apartment where the public papers or records of a state or community are deposited: sometimes, by a common figure, applied to the papers themselves.

By some the word archive is supposed to have been derived from the Greek *Ἀρχαία* (*Archeia*), a term used by Josephus in the sense of public registers, and considered to have been transmitted to us through the Latin of the middle age. The Greek word *archeion* seems, in its primary signification, to mean 'a council-house or state-house,' or 'a body of public functionaries,' as the Ephori at Sparta. (See Aristot. *Politic.* book ii.; and Pausan. iii. 11.) Others derive it from *arca*, 'a chest;' such being, in early times, a usual depository for records. So Isidorus, *Orig.* lib. xx. c. 9 — 'Archa dicta, quod arceat visum atque prohibeat. Hinc et archivum, hinc et arcanum, id est secretum, unde cæteri arcentur.' 'It is called Archa, because it does not allow (*arc*-eat) us to see what is in it. Hence also Archivum and Arcanum, that is, a thing kept secret, from which people are excluded, (*arc*-entur.)'

The Temple of Saturn, built in the time of the Republic, was the chief repository of the archives as well as of the public treasure of ancient Rome. In England the archives of the Court of Chancery are kept partly (*i. e.* to the year 1483) at the Tower of London, and partly in the Rolls Chapel, Chancery-lane. The national archives of France are preserved in the Hôtel Soubise at Paris; those of the Courts of Justice, in La Sainte Chapelle at the Palais de Justice.

ARCHIVOLT, or ARCHIVAULT, means, literally, the principal turning, or arch, and is applied to any orna-

mented band or moulding which runs round the lower part of all the voussoirs of an arch.

ARCH-LUTE, a large lute, or double-stringed theorbo (see *THEORBO*), formerly used by the Italians for the base parts, and for accompanying the voice, the form of which is given by Mersenne and Kircher in the next cut. In the early

editions of Corelli's *Sonatas*, the principal base staff is assigned to the violone (double-base), or *arcileuto*. According to Kircher (*Musurgia*, lib. vi.), this instrument had fourteen notes, the highest whereof was A, the fifth line in the base, the lowest the double G below; and possessed considerable power. It was about five feet in extreme length, and proportionally large in the body. As Luscinius does not notice the arch-lute in his *Musurgia*, printed in 1536, it is to be inferred that it was invented subsequently to that time. At the commencement of the last century this instrument was much in use; Handel employed it in many of his early operas. The office of *Lutenist* still continues as part of the establishment of the Chapel-royal, though the place has been a sinecure for nearly a century.

A'RGHON, a Greek word written in Roman characters, signified originally one who had rule or command, either civil or military. In modern usage it is known only as the title of certain magistrates of the Athenians, of whom we propose to give some account in this article.

On the abolition of regal government at Athens (see *COBRUS*), the chief power was still intrusted to a single magistrate, or archon, without the title of king (*βασιλεύς*), which was more directly associated with the idea of arbitrary rule. The new office was hereditary; at least it is said to have been enjoyed successively by lineal descendants of Medon, the first archon, who was himself a son of Codrus, the last king. The Athenians were fond of attributing to Theseus the origin of their democracy; by which probably they meant, that many of his regulations had a popular tendency, and that his general reformation of the state, which was favourable to that part of the population which had possessed no political rights, was accompanied by a permanent relaxation of regal authority. (Plut. *Vit. These.* c. 25.) The prerogative of the archon was still further limited; for he was made responsible to his fellow citizens for the acts of his government. (Paus. iv. 5, 10.) Tradition told of thirteen hereditary archons, after whom the chief magistrate was appointed to his office for ten years, but was still taken from the Medontidae, or de-

descendants of Medon. We have the name of Charops and of five others after him as decennial archons. (Vell. Patern. 1, 8.) Another revolution, which is placed by Newton B.C. 607, limited the duration of the office to a single year, at the same time dividing the charge of administration between the chief magistrate and eight others, thus forming a council of state, which consisted of nine magistrates or archons. Hence they are sometimes mentioned by the Greek writers under the general designation of The Nine. These officers had their distinguishing titles and duties, of which we shall presently speak, when we have carried a little farther the general history of this new constitution. We have seen that the first archon was, like his royal predecessor, the head of the government. The decennial archons had, doubtless, the same place and character, and the annual magistrates for a time exercised collectively the political power before vested in a single ruler. Their names and number, and in great measure the particular civil duties assigned to them, remained unaltered whilst Athens continued to possess an independent government; but the course of events wrought a most important change as to their position in the state. This change, to which in earlier times there was a gradual approximation, was effected mainly by the increased activity of the ecclesia, or popular assembly, which received its first impulse from the regulations of Solon, was urged on more effectually by the reformation of Cleisthenes, and was confirmed by the consequences of the Persian war, by which the *theles*, or lowest class of citizens, which supplied the naval strength of Athens, were taught to know their power. (Aristot. *Polit.* 2, 9, 4.) From the time that the ecclesia interfered habitually and directly with the government of the republic, the actual minister of state was the person who enjoyed the confidence of the people, which neither the office of archon nor any other office could procure. The inevitable consequence was, that the archons sunk from ministers of state into municipal officers of high rank. We have thought it worth while to point attention to this fact, from having had occasion to observe that young students of Athenian history are sometimes perplexed by the apparent inconsistency of the accounts given them of the first appointment of archons with the little notice bestowed upon these magistrates in the general history of the republic. They read of important public measures, and of the persons who originated and executed them, whilst the name of archon seldom occurs in Grecian history, except as marking the year in which certain events took place. (See Thucyd. ii. 2.) Pericles, without the office of archon, to which it was not his chance ever to attain, enjoyed a degree of power which was not possessed during the freedom of the republic by any other citizen. Perhaps no one who read with the least attention would find the difficulty, if he were not in some measure led to it by popular works on Grecian antiquities, which too commonly present an accumulation of facts and authorities without sufficiently discriminating the times to which the different statements refer.

The annual archons, from their first appointment down to the time of Solon, were taken from the eupatridæ, or nobles, to which class all political power seems to have been confined. This is rather assumed from what we know of the progress of civil and political society at Athens, than asserted on any authority of much weight. The establishment by Solon of a timocracy, or government in which political power was distributed with reference to property, put an end to the claims of noble blood; but since the archons were by this regulation taken from the wealthiest class of citizens (οἱ πεντακοσιομήδιμοι), the noblest families probably still continued chiefly to supply the archons for each year, till the celebrated law of Aristides, enacted about B.C. 479, threw open the offices of state to the whole body of the people. (Plut. *Vit. Arist.* c. 1. and c. 22.) From this time no qualification was requisite in an Athenian citizen for the office of archon but fair fame and freedom from bodily defect.

The mode of appointment presents some difficulties, from the want of precise information. It appears that the archons were originally elected by suffrage, and the elective franchise was probably confined to the noble class from which they were taken. By Solon, eligibility to the office, and perhaps the right of suffrage, were enlarged, but the mode of appointment remained the same. In after times, and even as early as the first Persian invasion of Greece, the appointment was by lot. The case of Aristides seems to have been an exception to the general rule, and may be attributed, per-

haps, to his high character and eminent services. (Aristot. *Polit.* 2, 9, 2; Herod. 6, 109; Plut. *Vit. Arist.* c. 1. p. 481, ed. Reisk, compared with p. 479.) We have no information which enables us to fix the time when the change was effected. It has been attributed, with some probability, to Cleisthenes, but we know only with certainty that they were at one time elected, and at some subsequent period appointed by lot. It must not be supposed that all the citizens were eager to avail themselves of the double opportunity offered by the new mode of appointment and the law of Aristides. It seems that the poorest of them declined the hazard of the lot, which might throw upon them a burdensome honour. (Xen. *Rep. Athen.* 1, 3.)

Of the nine archons, one, usually termed *the archon*, was chief, and had the title of *epónymus* (ἐπώνυμος), or name-giver, because the year in which he served the office was called by his name, as among the Romans the year was distinguished by the names of their consuls. Thus his name appears at the head of all public decrees (see Dem. *De Cor.* Thucyd. 5, 19), and generally in all solemn records of state. Of the remaining eight, one was called the king (βασιλεύς), another the *polemarch*, and the last six had the general title of *thesmothetæ*. Before admission to their office they were subjected, like other public officers, to the examination, called *dokimasia* (that is, *trial or examination*), for the purpose of ascertaining that they were Athenians of pure blood, whole of limb, and without blemish in their characters. With reference to the last point, they were asked if they had treated their parents kindly. When once invested with their office and adorned with the chaplet, the distinguishing mark of it (Æsch. *contra Tim.* p. 3, 33), they were especially protected by the laws from all insult and outrage, and were exempted even from those public burdens which were not included in the general exemption granted to their most favoured citizens, the descendants of Harmodius and Aristogeiton. (Dem. *contra Lept.* p. 462, 20; and p. 465, 17.) There is reason to believe that they were members of the council of Areopagus by virtue of their office. (See *AREOPAGUS*.) It is certain that they passed from their annual magistracy to a permanent seat in that council.

Their public duties had reference for the most part to the administration of justice. In some courts, and in certain causes, they were the presiding judges. On some occasions they had the execution only of the sentence pronounced by other judges; but it seems to have formed a large if not the most considerable part of their legal duties to bring causes into court (εἰσάγειν, Dem. *contra Lacr.* p. 940, 5-20) to be tried before the proper tribunal, not in the character of public prosecutors, but on application from the plaintiff or accuser, in which case their province was somewhat similar to that of an English grand jury in finding and ignoring bills. Sometimes, perhaps, the application to the archon was a form of little more importance as to the responsibility of the archon, than that in English law of suing out a writ. To each of the first three archons, and collectively to the six thesmothetæ, a distinct province and peculiar duties were assigned. Incidental notices of these are to be found scattered over the Greek classics, especially in the Attic orators; more systematic accounts occur in the earlier lexicographers and antiquarians, among whom Julius Pollux may be particularly distinguished, whose authority would have more weight if we were better acquainted with the sources from which their information was derived and the times to which their accounts refer. Copious collections have been made from them by modern compilers, of whom, perhaps, the most popular in our language is that of Archbishop Potter. We shall present our readers with only a brief outline, sufficient to convey a general view of the separate jurisdiction of these magistrates in the later times of the Athenian republic.

It seems to have been the duty of the chief archon, or epónymus, to throw his official protection around those whose interests were most liable to be overlooked in the ordinary execution of the law. Hence he was the appointed guardian of orphans and minors. He was also charged with a more general superintendence in matters which concerned the safety and good order of the state than was committed to his colleagues.

The king archon was more especially concerned with religious matters. He was required to preside at the performance of the most solemn sacrifices. He had a certain control over the ministers of religion, and either himself tried offenders, or originated trials, in cases of impiety. It

is hardly necessary to observe that in the early periods of regal government, kings were almost universally the chief ministers of religion. It is commonly supposed that the title of this archon was intended to denote the transfer of an important part of the king's prerogative to the magistrate who, in the department of religion, supplied his place.

The office of the polemarch was doubtless in its first institution that which the name implies, to command in war; and even as late as the battle of Marathon, we find the polemarch Callimachus acting an important part in the council of war which preceded it, and commanding in virtue of his office the right wing of the Athenians in the engagement: but, in later times, when the generals of the republic were immediately chosen by the people, the polemarch was confined to the discharge of civil duties, and particularly had cognizance of matters which concerned the strangers and *metics* (resident aliens) at Athens, exercising a jurisdiction, in this respect, not unlike that of the prætor peregrinus at Rome.

The thesmothetæ should, according to the meaning of their title, have been legislators, or propounders of laws. It was not, however, their office to introduce laws, but rather to watch over the conduct of those who put themselves forward as legislators, and also annually to examine the existing laws for the purpose of removing contradictory and superfluous enactments—to keep, as it were, the statute-book in a pure and consistent state. (Dem. *contra Lacr.* p. 940, 10, and 12; *contra Zenoth.* p. 890, 10; *Lys. contra Andoc.* p. 104, 15; Herod. 6, 109, 111; *Lys. contra Panch.* p. 166, 32, and 40.) It appears that the whole college of archons was sometimes assembled in council (Dem. *contra Meid.* p. 542, 2); but we have no information respecting the authority which they collectively exercised.

For further information on the various and important duties assigned to the different archons, in addition to this brief and general notice, the reader is referred to the authorities mentioned above; but we would remind the young student, in his inquiries, that the reliance to be placed on the accuracy of even a credible and well-informed author must depend in some measure on the circumstances under which his information is given; and this should especially be kept in mind when, as in the subject of the present article, all our information, so far as it is supplied by the Greek classics, is obtained, not from regular essays, but from incidental notices. Our meaning in this caution will be best explained by an instance. The subject of inquiry may be the manner in which certain officers were appointed; and this, as in the case of the archons, may have varied at different times. The mode of appointment may, according to a common practice with the Athenians, be implied by an epithet familiarly joined with the title of the office. Now, it is possible that an author, who when writing professedly on the subject would have given minutely accurate information, may use this epithet, familiar to him, inaccurately with reference to the times of which he is speaking, if the circumstance indicated by it is of no importance to the subject immediately before him. Evidence drawn from a casual expression must often be taken into account, but then it should be carefully rated at its proper value.

ARCHYTAS, a native of the Greek city Tarentum in Italy; of whose life we can give only a very unsatisfactory account. His father's name is variously given as Hestisæus, Mnesarchus, or Mnesagoras; but however that may be, all ancient accounts concur in considering him a man of extraordinary talents, uniting the merits of a philosopher, mathematician, statesman, and general. Even the period at which he lived is disputed; but if the *ὁ πρὸ Ἀρχύτα* *Ἡσυχαστοὶ* signify Archytas, he must have been contemporary with the younger Dionysius (Plut. *Dion.* 20.) and with Plato. Archytas belonged to the Pythagorean school, and was himself probably the founder of a sect. He is distinguished more particularly for his knowledge of mathematics,

*Te maris et terræ numeroque carentis arena
Mensorem.*—(Horat. l. 23.)

The poor gift of a little dust confines,
And near unto the Matine shore enshrines,
Thine now (Archytas), who could'st measure well
The sea, the earth, and sands which none can tell.

Odes of Horace, by Hawkins, London, 1635.

and for his discoveries in practical mechanics. In what way he contrived to communicate the power of flying to his wooden pigeon, we are by no means able to state, but it seems to have been a great source of wonder to the ancients. (Aul.

Gell. x. 12.) Probably this Archytas is the person recorded in Aristotle (*Politic.* book 8) as the inventor of that useful toy, a child's clappers or rattle (*παραγῆ*). Many works are ascribed to him, and we have still several small pieces under his name, but there seems good reason to doubt whether they are the genuine productions of Archytas. Archytas is said to have been drowned, as Horace intimates in the Ode quoted above. There is a *Treatise on the Ten Categories, or on the Nature of The All*, published in Greek by Camerarius (Lips. 1564. Venet. 1571), and a fragment on Mathematics, edited, with some other opuscula, by Stephens (Paris, 1557), reprinted at Copenhagen, 1707. The fragments of the works attributed to Archytas are chiefly known from the quotations of Stobæus. (See Schmidt, *Diss. de Archyta Tarentino*, Jena, 1683; Navarro, *Tentamen de Archyta Tarentini Vita-atque Operibus*, Hafn. (Copenhag.) 1819; Montucla, *Histoire des Mathém.* vol. i. p. 143; Bardili, *De Archyta Tar. in Nov. Act. Soc. Lat. Jenens.* vol. i. p. 1.)

ARCIS-SUR-AUBE, a town in France, in the department of Aube, and the capital of an arrondissement to which it gives name. It is ninety-three miles E.S.E. of Paris, and sixteen miles N. of Troyes, the capital of the department. It is on the S. or left bank of the Aube, which begins to be navigable here, and by means of this river it carries on a considerable trade with Paris in corn, wine, wood, iron, and mill-stones. There are manufactories of cotton hose here; and a tribunal de première instance, or subordinate court of justice, under the jurisdiction of the assize court of Paris. The population in 1826 was about 3000.

Arcis was injured by the allies in 1814, but has since been much enlarged and improved: 48° 32' N. lat., 4° 9' E. long. from Greenwich.

The arrondissement of Arcis comprehends ninety communes, and has a population of about 33,000 persons.

ARCKENHOLZ, JOHN, a Swede, was born in Finland in 1695. He studied at Upsal, after which he travelled over Europe, and resided at Paris a long time. There he wrote, in French, *Considerations Politiques sur la France par rapport à la Suède*, in which he spoke unfavourably of the former country, and censured the administration of Cardinal Fleury. Having communicated his MS. to several persons, he was arrested on his return to his own country and obliged to apologize to the cardinal minister. King Frederic I., of the house of Hesse Cassel, appointed him, in 1746, librarian and keeper of the cabinet of medals at Cassel, where he remained for twenty years. He wrote, in French, the *Mémoires de Christine, Reine de Suède*, 4 vols. quarto, Amsterdam, 1751, also *Lettres sur les Lapons et les Finnois*, 8vo. Frankfort, 1756, and *Recueil des Sentimens et des Propos de Gustave Adolphe*, Stockholm, 1769. From Arckenholz's MS. account of that prince, joined to other Memoirs, a history of Gustavus Adolphus was compiled by M. Mauvillon, and published in French at Amsterdam in 1764, and afterwards translated into German under the title of *Geschichte Gustav. Adolphi*, 2 vols. 8vo. Breslau, 1775. Arckenholz's manuscript on France and Sweden was published in Büsching's *Historical Magazine*. Arckenholz had been commissioned by the states of Sweden to write the history of Frederic I., but he never completed it, his mental faculties having grown weak; he died in 1777, at the age of eighty-two.

ARCOLE, a village in the Venetian States, about fifteen miles S.S.E. of Verona, lies in the midst of a low marshy country, through which the Alpone flows, a torrent which comes from the mountains near Vicenza, and empties itself into the Adige about three miles below Arcole. It is situated on the left or eastern bank of the Alpone, farthest from Verona. The ground between the left bank of the Adige and the right bank of the Alpone is one impervious marsh, intersected by two or three causeways, one of which leads to a narrow bridge over the Alpone, and to the village of Arcole beyond it. It was along this causeway that the French, under Bonaparte, having crossed the Adige at the village of Ronco, advanced on the morning of the 15th November, 1796, with the view of surprising the rear of the Austrian army under General Alvinzi, which was then posted on the heights of Caldiero near Verona. Two battalions of Croats and Hungarians were posted at Arcole, with some artillery, and they stoutly defended the bridge. Three times the French column attempted to storm it, amidst a shower of grape-shot and musketry, and three times it was repulsed with great loss. Bonaparte himself was thrown from the causeway into the marsh, and was near

being taken. At last General Guyeux, with 2000 men, having crossed the Adige farther down, at the ferry of Albaredo, below the confluence of the Alpone, marched by the left bank of the latter stream, where the ground is firmer, and took possession of Arcole. General Alvinzi, however, having sent reinforcements in the evening, retook the village. Next day (16th) the battle became general between the two armies, and the village of Arcole was again the main point of the contest. The French attempted repeatedly to carry the fatal bridge, and were again repulsed with tremendous loss. Almost all their superior officers were killed or wounded. Thus passed the 16th, the Austrians retaining possession of Arcole for that night. On the 17th, Bonaparte, having thrown a bridge over the Alpone just above its confluence, directed Augereau to march with a column by the left bank, whilst another column advanced by the famous causeway. The latter was repulsed as before; but Augereau, after a sharp contest, succeeded in gaining possession of the village. General Alvinzi then made his retreat upon Montebello and Vicenza. This was the hardest fought battle in Bonaparte's first Italian campaigns, and one in which he showed great personal courage. The Austrians lost about 4000 killed, and as many were taken prisoners. The French loss in killed and wounded was not made known, but it must necessarily have been very great. Bonaparte's obstinacy in attempting so many times to carry the bridge in front, instead of turning it, as he was obliged to do at last, has been strongly censured. [See BONAPARTE, NAPOLEON.]

ARÇON, JEAN CLAUDE D', a native of Pontarlier in Franche Comté, in 1733, showed an early inclination for the military profession. He became an expert engineer, and wrote several treatises, among which may be enumerated, *Correspondance sur l'Art de la Guerre*, and *Réflexions d'un Ingénieur en réponse à un Tacticien*, duodecimo, Amsterdam, 1773. In 1780, the war of France and Spain against England gave him an opportunity of displaying his talents on a larger scale. The Spaniards were besieging Gibraltar without success, when D'Arçon devised a plan of attack, by means of floating batteries, which were to be incombustible and not liable to sink. His scheme being approved by the Spanish government, ten ships of from 600 to 1400 tons were cut down, each forming a battery of from nine to twenty-one guns, and manned by crews of from 250 to 760 men. The front of the batteries was covered with thick layers of squared timber, a sloping roof protected them from shells, and the exterior of the floating machine was lined with cordage and hides. In order to prevent combustion from red-hot balls, a reservoir was placed in each battery from which the water raised by pumps could be distributed by certain channels through every part of the fabric, so as to keep the wood constantly wet. Each floating battery was set in motion by a single sail. The ten batteries were to form a close line at 400 yards distance from the wall of the fortress, and the attack was to be supported by the land-batteries, by bomb-vessels and gun-boats, and by ten Spanish ships of the line. The equipment of this vast armament was made in the port of Algeiras, and 40,000 men, French and Spaniards, were assembled for the expedition, of which the Duke of Crillon, the conqueror of Minorca, had the chief command. The Spanish admiral, Moreno, commanded the fleet. The first nobility of Spain repaired to the spot to witness the attack, and the Count d'Artois (since Charles X.) and the Duke of Bourbon went from Paris for the same purpose. The attack was, however, precipitated through fear of the approaching stormy season, and the expected arrival of a British squadron. When the vast machinery was set in motion, it was found that the pumps occasioned such a flow of water into the interior of the vessels that the commanders became apprehensive lest their powder should be spoiled, and they therefore contented themselves with keeping the outer surface wet. On the morning of the 13th of September, 1782, the floating batteries moved forward, but were unable to gain the positions assigned to them; the wind, the roughness of the sea, and perhaps want of skill, entirely disconcerted the plan. The two largest, the Talla Piedra and the Pastora, anchored in advance, the rest some distance behind. The cannonade began soon after ten o'clock; and 400 pieces of heavy artillery were playing at once from both sides. General Elliot fired on the floating batteries with red-hot balls, which seemed to have no effect, till seven o'clock in the evening, when the Talla Piedra, in which D'Arçon

was embarked, was discovered to be on fire. 'A red-hot ball,' says D'Arçon, 'had lodged in the side, and could not be extinguished. The fire of the enemy frustrated all our efforts to arrest the progress of the flames. An order was precipitately given to wet the powder, and this caused a total cessation of our cannonade. As we were no longer concealed by the clouds of smoke, we became too much exposed, and it was found impossible to extinguish the flames. The smoke proceeded at first from the outside, and afterwards through the interior joints of the machine. This hidden conflagration, which could easily have been stopped by moving to a distance from the constant fire of the garrison, continued in a smoking state for six hours, and did not become unmanageable till after midnight.' D'Arçon had proposed to send out a warp anchor, by which the vessel might be removed from its dangerous situation. 'The officer charged with this commission could not collect a sufficient number of sailors for the purpose.' In fact, panic and confusion had seized them when they found that the batteries were not incombustible. D'Arçon repaired at midnight to the admiral's ship, but he was referred to the general-in-chief, who was absent; he was, however, informed that orders had been given to abandon and destroy the whole of the batteries. Only the two foremost, the Talla Piedra and the Pastora, seem, at this time, to have caught fire, so that the other eight might probably have been saved. Such is D'Arçon's account in his *Mémoire pour servir à l'histoire du Siège de Gibraltar*, which he published at Cadiz, in 1783, and it explains pretty clearly how the catastrophe occurred, without attributing it, as some French biographers have done, to perfidy and jealousy on the part of the Spaniards. There was mismanagement, no doubt, both by the French and Spanish commanders, and D'Arçon himself was evidently mistaken with regard to the security of his batteries against red-hot balls. D'Arçon afterwards served in the French army at the time of the revolution, and assisted in the conquest of Holland. In 1795 he published *Considérations Militaires et Politiques sur les Fortifications*, in which he condensed all that he had previously written on the subject. He was made a senator in 1799, and died the following year at his estate near Auteuil. (See the account of the siege of Gibraltar in Coxe's *Memoirs of the Kings of Spain of the House of Bourbon*; and Captain Drinkwater's *Account of the late Siege of Gibraltar*, &c., Lond. 1785.)

ARCOT, a considerable district of Hindostan, forming part of the Carnatic (see CARNATIC). The territory thus named is subdivided into the two districts of northern and southern Arcot; both of which are under the government of the Madras presidency. They are situated between the 11th and 14th parallels of north lat., and the 78th and 80th degrees of east long. Northern Arcot is bounded on the north by Cuddapah and Nellore; on the east by the district of Chingleput and the sea; on the south by southern Arcot; and on the west by the Balaghaut, the high central tableland of Cuddapah. Southern Arcot is bounded on the north by the northern division of Arcot; on the east by the sea and the Chingleput district; on the south by Tanjore and Trichinopoly; and its western boundary is formed by the district of Salem and the Balaghaut region. This district comprehended Pondicherry, during the time in which that settlement was in the hands of the English. Chingleput, the Jaghire, or tract obtained by the East India Company in 1750 and 1763 by grants from the nabob of Arcot, in return for services rendered to his father and himself, was also formerly included within the limits of Arcot.

It was doubtless owing to the frequent wars of which these districts were the seat, and which raged for so long a time during the infancy of the British empire in the Carnatic, that the condition of the country and its inhabitants became so deplorable. The agriculture of Arcot depends for its prosperity upon irrigation; but it appeared, upon a survey made in 1810, that of 2698 large tanks 451 were then out of repair, and of 1322 smaller tanks the still greater proportion of 510 were useless, while the water-courses from rivers, springs, and wells, were scarcely in a better condition. The peace of the country being restored, and an improved system of management having been adopted by the Company's government about the time just mentioned, the prosperity of the district has been in a great degree restored. At that time (1810) the northern district contained 3599, and the southern district 3988 villages; the gross collection of the public revenue amounted, in 1817, to 1,382,279 pagodas, about 550,000*l.*

Five years after that time, in 1822, the total population was stated by the Company's collectors to be 1,347,312, nearly two-thirds of whom inhabited northern Arcot.

The lands throughout the districts are for the most part held by an industrious race of yeomanry or small proprietary cultivators, either in severalty, or in joint village communities. These cultivators pay their proportions of the revenue chargeable on the land which they occupy direct into the treasury of the state, without the intervention of any zemindars or great proprietors, as is the case in a large proportion of Hindostan.

The whole of these districts were, in 1801, formally ceded by treaty to the East India Company by the nabob of the Carnatic, Azim ul Omrah. On this occasion the British government undertook to adjust the claims made by the creditors of the nabob, for whose satisfaction an annual revenue of 340,000 pagodas was set apart. Commissioners were in consequence appointed both in India and in London for the investigation of the claims, and these boards have been in existence and in operation since 1805, endeavouring to unravel the intricacies in which the accounts were involved for fraudulent purposes. Out of a sum exceeding thirty millions sterling claimed against the estate of the nabob, the commissioners have set aside claims to the amount of upwards of twenty-seven millions on the grounds of fraud, and of that very common crime in India, forgery.

The northern and southern divisions of Arcot now form separate collectorates under the Company. The northern division includes Sativaid, Pulicat, Coongoody in the Barramahal, part of Balaghaut, and the western pollams or zemindaries. The southern division includes Cuddalore.

The chief rivers of the district are the Panaur or Punnair, which rises in the province of Mysore, from which it flows in a south-easterly direction till it falls into the sea at Cuddalore after a course of about 250 miles from its source. The Palaur or Milk river has its source very near that of the Panaur, but, taking a different course, flows first to the south, and then to the north-east, and after a winding course of about 220 miles falls into the Bay of Bengal near to Sadras. [For a description of soil, productions, and face of the country, see CARNATIC.] (Rennell's *Memoir of a Map of Hindostan*; Hamilton's *East India Gazetteer*; *Report of Committee of the House of Commons on the Affairs of India*, 1832.)

ARCOT (City). The Mussulman capital of the Carnatic is built on the south side of the Palaur, in $12^{\circ} 54'$ N. lat. and $79^{\circ} 23'$ E. long. It is a place of very great antiquity. For an Indian fortress, Arcot was a place of some strength, having been a regularly built citadel. Since the cession of the district of Arcot to the East India Company the principal defences of the place have been destroyed, part of the extensive area of the fort has been brought under cultivation, and the only use now made of the ramparts is to constitute a defence against the inundations of the Palaur, for which purpose alone they are kept in repair on that side of the city.

The town, which is inclosed by walls, is almost entirely of modern erection. It contains the palace of the former nabobs of Arcot; the principal gateway of the palace is entire, but the rest of the building is a heap of ruins.

The nabob, Anwar ed Deen, was killed in battle, and the place was taken in 1749 by Chunda Saheb, who favoured the French interests in the Carnatic. In two years, the city with its garrison of 1100 men surrendered to 200 Europeans and 300 Sepahis under the command of Captain (afterwards Lord) Clive, who had subsequently to defend his conquest, which he did successfully, against a very superior French force assisted by numerous allies, and whom he obliged to raise the siege at the end of fifty days. The fort subsequently fell into the possession of some natives who espoused the cause of the French, but it was again taken by the English under Colonel Coote, in the beginning of 1760, after the battle of Wandiwash. In 1780 it surrendered to Hyder Ali, and suffered greatly, both while it was in his hands and afterwards, through the mismanagement of the nabob's government. From the wretched state into which it then fell, the city has been recovering since it passed, in 1801, into the possession of the English. The principal inhabitants are Mohammedans, who speak the Hindostanee dialect. The bed of the Palaur, which is here half a mile wide, is sometimes nearly dry, and at other times is so swollen by the rains that its waters would inundate the streets but for the embankments already described.

Arcot is 73 British miles from Madras, 722 miles from Bombay, 1070 from Calcutta, and 1160 from Agra. (Mill's *History of British India*; Rennell's *Memoir of a Map of Hindostan*; *Report of a Committee of the House of Commons on the Affairs of India*, 1832.)

ARCTIC CIRCLE. The term *arctic* is derived from the Greek, and signifies literally *of or belonging to the bear*, meaning the constellation of that name. *Arctic circle* had formerly a different signification from that which it now has. Among the Greeks it meant the parallel to the equator which just touches the horizon, being entirely above it, and which therefore separates those parallels which are always above, from those which are partly above and partly below, the horizon. (See Strabo, Casaub. p. 95) Similarly the antarctic circle (if the phrase were used) would be a parallel to the equator which touches the horizon, being entirely below it, and which therefore separates those parallels which never rise above, from those which are partly below and partly above, the horizon. Thus every different latitude had a different arctic circle; and in the latitude in which astronomy was first cultivated, the great bear just swept the sea, and did not set, whence the boundary circle obtained its name.

In the modern sense of the term, it is one fixed circle, or very nearly so; and the first use of it as such is found in the celebrated treatise on the sphere, by Holywood, better known by the name of Sacrobosco, published in the twelfth century. For the complete meaning of the term, we refer to DAV. We can only here briefly remind the reader that at the equator all days are equal; that in going northwards from the equator, the day of the summer solstice lengthens as the latitude increases, until we reach the pole, where there is but one day and night in the year, of six months each. There must therefore be some circle of the globe, in the northern hemisphere, at which the longest or summer solstice day is just twenty-four hours; and an opposite circle in the southern hemisphere, at which the sun does not appear for twenty-four hours. The first is the *arctic*, the second the *antarctic*, circle of the earth.

We need hardly say, that at the day of the winter solstice in the northern hemisphere, there is a day of twenty-four hours in length at the *antarctic* circle.

P and p (fig. 2.) are the north and south poles of the earth, the lines through which serve to remind us of the earth's axis. AB is the equator, and OH and OL are the directions in which the sun is seen at the northern summer and winter solstices, that is, the line which points to the sun rises and falls between HO and OL twice in a year. We do

not consider the *apparent* motion of the sun round the earth, because, as the sun is always on the meridian of some place, and any conclusion respecting day and night drawn from one meridian holds good for any other, we may conceive

Fig. 1.

Fig. 2.

the meridian PBpA to move round with the sun. Or, to consider it in another point of view, instead of supposing the sun to appear to move round, let it remain in the fixed meridian, PBpA, and increase the daily rotation of the earth by a quantity equal to the daily motion of the sun on the equator, which will preserve the *relative* rotations, leaving us only to take notice of the rise and fall of the sun in the ecliptic; which is the cause of the peculiar phenomena of the arctic circle. The semicircle OV, in the first figure, is supposed to be cut out and applied to the right hand figure, O to O, in such manner that the needle, V, shall always be directly opposite to the sun. In the figure (2.) are given the extreme positions of OV, namely, MUm, at the northern summer, NWn at the northern winter, solstice. The semicircle OV covers all those parts of the earth which do

not see the sun, and the rotation round the axis, *Pp*, brings every part of the earth under *OV* when its night begins. *MN* and *mn* are the arctic and antarctic circles. By cutting out a semicircle equal to *OV*, and placing it in different positions on the second figure, the following will appear, on a little consideration :—

1. At the summer solstice (when *V* is at *U*) all circles above *MN* will be in light for twenty-four hours, and all below *mn* in darkness: and *vice versa* at the winter solstice.

2. At the equinoxes (*V* is at *A*) every circle will be in light for twelve hours, and the same time in darkness.

3. During the passage from the equinox to the summer solstice (*V* moves from *A* to *U*), at every moment some circle above *MN* emerges entirely into light, and an opposite circle below *mn* begins to be entirely covered by darkness: and both states remain until the return of the circle *OV* in the next quarter of the year. And *vice versa* for the passage from the equinox to the winter solstice (when *V* moves from *A* to *W*).

4. No circle lying between *MN* and *mn* is ever entirely in light or entirely in darkness.

Hence, to find the duration of light at any place above the arctic circle, that is, to find during what part of the year the sun performs his daily rotation entirely above the horizon, look in an almanac for the times before and after the summer solstice, at which the *declination* of the sun is equal to the *polar distance* (or latitude subtracted from 90°) of the place. Between those two times there is perpetual light. For example, the north point of Nova Zembla (latitude 75°, polar distance 15°) has perpetual light between May 1 and August 12, 1834. For the time of perpetual darkness do the same with the winter solstice: thus there is perpetual darkness at the above-mentioned place from November 3, 1834, to February 9, 1835.

The north polar distance of the arctic circle is equal to the angle *HOB*, the greatest declination of the sun, or the *obliquity* of the ecliptic. The south polar distance of the antarctic circle is the same. This quantity changes very slightly from year to year. It is as follows :—

January 1, 1834, 23° 27' 39"·26

January 1, 1835, 23° 27' 38"·81

decreasing at present by about half a second yearly.

The arctic and antarctic circles are the boundaries which separate the frigid from the temperate zones, as they are called. The part of the earth included within each of the two is about $4\frac{1}{2}$ per cent. of the whole surface of the globe. The best known points through or near which the arctic circle passes are Cape North in Iceland, the Maelstrom whirlpool, the mouth of the Oby, Behring's Straits, and the south of Melville Island. For discoveries of land within the antarctic circle, see *ANTARCTIC OCEAN*.

The arctic and antarctic circles of the heavens occupy positions with respect to the celestial poles similar to those occupied by the same circles on the earth. Thus a traveller going round the arctic circle would always have some point of the celestial arctic circle directly over head, or in his zenith. But the term is hardly ever employed by astronomers.

In all that precedes we have taken no notice of *REFRACTION*, the effect of which is to raise the sun a little towards the nearest pole at every point of the globe, thus lengthening the day and diminishing the night. In some latitudes the effect would be very considerable, and would increase the duration of light by as much as a day.

ARCTIC FOX, in zoology, a small species of fox (*Canis lagopus*), celebrated for the beauty and fineness of its fur, which has long been considered a valuable article of commerce. The colour of the fur, as is the case with all animals which inhabit very high latitudes, varies according to the season, being slaty blue in summer, and pure white in winter. It is in the latter state that the fur is most esteemed, not only on account of its colour, but likewise because it is of a closer and finer quality than at any other time. The soles of the feet also are at all seasons covered with a thick coat of fur, like those of the common hare, which defends them from the severity of the snow, and is a character likewise common to most other northern animals. For a more detailed account of the form, habits, and uses of the Arctic fox, see the articles *FOX* and *FUR TRADE*.

A'RCTOMYS. [See *MARMOT*.]

ARCTOSTA'PHYLOS, or bear-berry, is a genus of plants till lately considered the same as *arbutus*, from which it is essentially distinguished by its berries containing only from one to five, instead of a great many seeds. The common

bear-berry, *A. uva ursi*, is found wild in the mountainous parts of England and Scotland, and generally over the whole of the north of Europe. It is a trailing shrubby plant, with leathery dark green entire leaves, which are broadest at their upper end. The flowers are white, tinged with pink, small, and in clusters. The berries are small, and red like those of the hawthorn. The whole plant is so acrid that it has been employed by the tanner with success, and also in dyeing a greyish black colour; it is no doubt the same property which has made it celebrated for its efficacy in gravelly complaints, and in diseases of the urinary organs. When cultivated it requires to be grown in peat earth.

ARCTU'RUS, or *a Bootis*, a star of the first magnitude in the constellation Bootes. It derives its name from two Greek words, signifying the tail of the bear, and, though not in the latter constellation, it is very nearly in a right line drawn through the two hinder stars of the tail (ζ and η). It rises N.E. by E. at Greenwich, and is on the meridian in about 7½ hours after rising; which takes place at half past seven A.M., on the 1st of January, and about two hours later for the first of every succeeding month. Its mean places are as follows:

	Right Ascension. h. m. s.	Declination.
January 1, 1834, 14 8 5·6		20° 3' 1"·5 N.
January 1, 1835, 14 8 8·3		20 2 42·57

Its annual increase of right ascension is 2"·734; its annual decrease of declination 18"·96. This is not all owing to precession and nutation, as the star has a *PROPER MOTION*, (or change of place relatively to surrounding stars,) which (*Mem. Roy. Astron. Soc.*, vol. v., p. 165) caused a decrease both in right ascension and declination, as follows:

	Average yearly decrease of R. A.	Decl.
1755—1800	1"·21	1"·94
1800—1830	1"·14	1·99

Formerly the conclusion was sometimes drawn that Arcturus was the nearest star to our system, from its being a brilliant star with so decided a proper motion. This, which was but a faint presumption at the time, is now overturned by the known fact that there are much smaller stars (μ Cassiopeiæ, for example) which have much larger proper motions.

ARCY, GROTTTO OF, a singular excavation in the mass of a hill which stretches into the valley of the little river Cure, a feeder of the Yonne in France. It is in the department of the Yonne, about a league south of the little town of Vermanton. A narrow path over a hill covered with wood conducts to the entrance of the grotto, which contains a number of apartments, some of which are more than 1500 or 1800 feet long; but they rarely rise to the height of 20 feet. In the first two apartments are found large blocks or masses of stone lying in greater or less profusion on the ground; and in the second apartment is also a small pool about 120 feet in diameter, the depth of which is not known. Its waters are clear and fit for drinking. The apartments farther in are distinguished by the number and variety of the crystallizations which either hang from the roof (stalactites), or rise column-like from the ground (stalagmites); they are formed by the water which filters through the over-arching rock, and forms a deposit about the orifice from which it issues, as well as on that part of the ground on which it drops. As the crystallizations rising from below are thus exactly under those depending from the roof, they frequently unite and form pillars which appear to support the roof of the vaults. Many of these crystallizations are capable of receiving a polish.

In the *Dictionnaire Universel de la France* (Paris, 1804-5), these caverns are described as abandoned stone-quarries, in which time has obliterated the traces of human labour; but the writer of the article in the *Encyc. Méthodique* ascribes them to the effect of the waters of the Cure, (one channel of which, entering the hill a little above the entrance of the grotto, undermines and traverses it, emerging on the other side, and having sufficient stream to turn a mill,) and to other subterraneous waters. It is acknowledged, however, that the stone with which the cathedral of Auxerre is built was taken from this place; and if so, the caves, to whatever their origin may be ascribed, have been at least enlarged in some parts by the hand of man. (*Encyc. Méthodique*; *Dict. Univ. de la France*; Malte Brun.)

ARD, LOCH. [See *FORTH*.]

ARDAGH, now a decayed village in the county of

Longford, in Ireland, about five miles S.E. of the town of that name, was once a place of considerable importance: as it gives name to a barony, one of the six into which the county is divided, and to a bishopric now united with the archbishopric of Tuam. The parish, a rectory in the diocese of Ardagh, had a population in 1821 of 4942 persons. There is a church, and some remains of the ancient cathedral, which appears to have been a small building, though of very great antiquity, as it is supposed to have been erected not long after the conversion of the natives. There is also a free school for fifty children (thirty-two boys and eighteen girls), twenty of whom are educated at the expense of the dean of Ardagh. There are two fairs, viz., April 5, and August 26.

The see of Ardagh has undergone great changes. It was founded in the middle of the fifth century; united in 1658 to the see of Kilmore; separated in 1692, but reunited in the same year; again detached in 1741, and united with the see of Tuam, though it is in the ecclesiastical province of Armagh.

It is a small diocese, containing only twenty-five benefices, which comprehend thirty-seven parishes; but it extends into six counties. It is separated from the diocese of Tuam by that of Elphin. It has a dean and archdeacon, but no chapter. The temporalities are destined, upon the first vacancy of the see, to form part of the fund for defraying the expenses hitherto raised by the vestry cess. Ardagh is in 53° 38' N. lat., 7° 39' W. long.

ARDEA (*Vieillot*), the heron, a genus of birds under which Linnaeus comprehended the cranes and several other divisions now formed into distinct genera by modern naturalists. M. Vieillot followed Buffon in making four divisions of the herons; but Temminck, who has paid peculiar attention to these birds, arranges them under one genus and two sections. We prefer, however, on account of its distinctness, the arrangement of M. Vieillot, which has been partly followed by Lesson, Drapiez, and Baron Cuvier. The genus *Ardea*, as limited by Vieillot, is thus characterised:

Bill strong, straight, or slightly curved, compressed, acuminate, sharp, in most species finely toothed; the upper mandible somewhat channelled, and usually notched towards the tip; nostrils on the side, almost at the base, slit lengthwise in the groove, and half shut by a membrane; eyes with a naked circle around them extending to the bill; legs long, slender, and either half-naked or feathered down to the shank (*arsus*); the middle fore-toe united to the outer one by a short membrane; the back-toe articulated interiorly, and upon the same level as the others; the second and third quill feathers of the wings the longest.

Among the genera separated from *Ardea*, are *Anthropoides*, *Balearica*, *Grus*, *Cariama*, *Nycticorax*, and *Ciconia*; but considerable difference of opinion seems to exist with respect to these and a few other allied genera which have been proposed. The bitterns, however, though popularly distinguished from the herons, cannot, we think, with much propriety be separated from *Ardea*.

ARDEBIL, one of the principal towns of Azerbaijan, is situated, according to Jaubert, in 38° 14' N. lat., and about 48° 19' E. lon. from Greenwich, in a fertile plain encompassed by hills, at a distance of thirty hours' march from Tauriz (or Tebriz), and about seven and a half from the western border of the Caspian Sea. Monteith gives the lat. at 38° 10' 20"; Olearius at 38° 5'. A chain of hills, which separates Azerbaijan from Ghilan, keeps off the noxious winds that prevail in the sultry lowland of the latter province: it is probably in allusion to this circumstance, and to its advantageous situation generally, that Ardebil has been surnamed *Abadan-i-Firuz*, 'the abode of happiness.' But still it is not a very healthy place, being exposed to great changes of temperature. The trees about Ardebil do not begin to bud before the end of April, which shows that the temperature of the place is much affected by its position near the mountains. The town is of importance as an emporium in the caravan trade of Tiflis, Derbend, and Baku, with Ispahan and Teheran. In history, Ardebil is remarkable as having given birth to the dynasty of the Sufi or Safawi rulers of Persia: two of the ancestors of this family of kings, Sheikh Saffeddin and Sheikh Heider, are buried here; and their tombs are held in high veneration, as the sepulchres of saints, among the Mohammedans of the Shiite sect. Ardebil contained a fine library, which was sent to Russia when the place surrendered to Count Soukhtaline. This library is described by Olearius (ii. 638, Amster-

dam ed.). A small river, the Balulukh, runs through the town, which is subject to inundations when the snow on the surrounding hills begins to melt. The great mountain of Sevelan, next to Ararat, perhaps the highest in this country, is about twenty-four miles west of Ardebil; its height is roughly computed at about 13,000 feet. In the neighbourhood of Ardebil, there are several hot and mineral springs.

ARDECHE, a department in France, including nearly the whole of the former district of Vivarais (so called from the town of Viviers); the remaining part of the Vivarais, which is of small extent, is included in the department of Haute Loire. Ardèche is bounded on the north and north-west by the departments of Loire and Haute Loire, from which it is separated by the range of the Cévennes. On the west it has the department of Lozère, and on the south that of Gard. The eastern boundary along the whole length of the department is formed by the Rhone, which separates it from the department of Drôme. Its greatest length is about 80 miles from N. by E. to S. by W., and its breadth about 42 or 43 miles. The superficial extent is about 2116 English square miles, and the population about 328,000, or about 155 to a square mile.

The geology of this district is of a very interesting character from the abundance of volcanic phenomena which it presents. (See *VELAY and VIVARAIS*, and *CÉVENNES*.) The principal heights are along the western boundary of the department in the chain of the Cévennes. Mezen, which is just on the boundary, is 5820 feet in height, and Gerbier de Jones, from which the Loire rises, is 5125 feet. (See *Orographie de l'Europe*; and *Comp. to the Almanac for 1833*.) Indeed, the western part of the department is equal in elevation to almost any in central France. From these high lands descend the streams which by their union form the Cance, the Doux, the Erioux, and the Ardèche, which fall into the Rhone in the order (from north to south) in which their names occur. Of these the Ardèche alone appears to be navigable. The northern and western parts of the department abound in granite and sandstone, and yield rich iron ore, coal, clay for earthenware, and the finest kaolin for porcelain. Near Tournon, on the banks of the Rhone, are several lead-mines, and indications of copper have been observed near St. Laurent les Bains, in the western part of the department.

The lower grounds along the bank of the Rhone, and in the southern districts near Aubenas, produce the mulberry and the vine; the more mountainous parts yield the chestnut and the walnut, and afford pasturage to herds of cattle. The wines of St. Peray and Cornas are much esteemed. On the loftiest summits the snow lies eight months in the year: the department, from its unequal elevation, has a great variety of climate.

The capital of the department is Privas (population 4000), on the river Ouvèze, an insignificant stream which flows into the Rhone. L'Argentière (population near 3000) and Tournon (population 3600) are sub-prefectures or capitals of arrondissements. But these towns, which derive much of their importance from their political rank, are inferior in population to Annonay in the north, and Aubenas and Le Bourg St. Andeol in the south of the department. These have respectively 8000, 5000, and between 4000 and 5000 inhabitants. Aubenas is the great mart for the wine and chestnuts of Ardèche. It has two well-attended fairs in the year for the sale of silk, which their mulberry trees enable the inhabitants to produce. The cotton manufacture is carried on here; and in the neighbourhood are dye-houses, tan-yards, corn and oil mills, and silk manufactories. Near Le Bourg St. Andeol are the remains of an antient temple of the Gauls, among which are some nearly defaced bas-reliefs. For other of the places above-mentioned, see *PRIVAS*, *ARGENTIERE L'*, *TOURNON*, and *ANNONAY*. This department is in the bishopric of Viviers, a small town on the Rhone, a little north of the Bourg St. Andeol already noticed. It is within the jurisdiction of the *Cour Royale* (Assize Court) of Nîmes; and sends three members to the Chamber of Deputies. The inhabitants are said to be ignorant and superstitious. (Malte Brun; Balbi; *Dict. Géog. de la France*; *Encyc. Méthodique*.)

ARDECHE, a river of France, which rises in the Cévennes, and flows first to the E. then to the S. or S. by W., and then turning S.E. empties itself into the Rhone a little above Pont St. Esprit (D. of Gard), forming, in the lower part of its course, the boundary of the department of Ar-

dèche. This stream is perhaps about sixty miles long, but is not navigable for more than about ten miles. The river passes under the natural bridge of Arc, about eighteen or twenty miles above its outfall. This natural bridge consists of a very hard greyish limestone rock, forming an arch through which the river flows.

It has been used as a passage over the river ever since the Roman conquest. The road way is elevated nearly 200 French, or 212 English feet above the surface of the water. The arch has an elevation of ninety French, or between ninety-five and ninety-six English feet, and the breadth near the base is about 163 French, or 173 English feet. The length of this tunnel or arch is not given by our authorities.

Geographers have spoken of it as originally a work of nature, but perfected by the hand of man. The writer of the article *Ardeche* in the *Encyclopédie Méthodique (Géog. Physique)*, is of opinion that the river has worn this passage through the rocks round which it once took its course; having first effected a small opening, and gradually enlarged it. On the other hand, Malte Brun (*Géographie Universelle*) affirms that the arch does not exhibit any marks of the rock having been worn away by the stream; and denies, not only that the river originally formed, but even that it has at all enlarged the opening. He considers it a natural cavern formed by the decay of the rock on the bank of the river; and observes, that a tendency to decay is one of the characteristics of the kind of limestone which composes the mass. (*Encyc. Méthodique*; Malte Brun.)

ARDEE (or ATHERDEE), a market town, in the barony of Ardee, county of Louth, Ireland, forty-three miles N. by W. of Dublin, on the Lifford and Derry road. It is pleasantly situated on the river Dee, which is a small stream uniting its waters with those of the Lagan, and flowing into the Irish sea. The town had in 1821 a population of 3588 persons, and the rest of the parish contained 1773. The living is a vicarage, which has been united from time immemorial with those of Shenlis, Smernmore, and Stackallen, and from a later period with the rectory and vicarage of Killdemock. The united parishes are in the diocese and province of Armagh. There are in the town two schools on Erasmus Smith's foundation, one containing eighty-four boys, and the other eighty girls, on the Lancasterian system; there is also a dispensary.

Ardee returned two members to the Irish Parliament, but lost its franchise with the Union; it has four fairs in the year. It gives the title of baron to the Brabazon family, earls of Meath.

Ardee was antiently a walled town, and defended also by a strong castle, erected by Roger de Pippard, lord of Atherdee, about the close of the twelfth or the beginning of the thirteenth century. There were two monastic establishments here; an hospital for Crouched Friars, following the rule of St. Augustin, founded in 1207 by the above-mentioned Roger de Pippard, and a Carmelite friary, the church of which, filled with men, women, and children, was burned by the Scots and Irish under Edward Bruce in 1313. Near the town is a remarkable mound called Castle Guard, of ninety feet perpendicular height, 600 feet in circuit at the base, and 140 feet at the summit. It is tastefully planted, and is surrounded by a deep and wide trench, or, according to other accounts, a double ditch and vallum (*i. e.* embankment). The remains of two structures, one seemingly a castle or tower, and the other a kind of parapet, are on the summit. These mounds, which the Irish call *raths*, and attribute to the Danes, are more numerous in the county of Louth than in any other county. (*Carlisle's Top. Dict. of Ireland*; *Traveller's New Guide through Ireland, &c.*; Beaufort's *Mem. of a Map of Ireland, &c.*) 53° 50' N. lat., 6° 30' W. long. from Greenwich.

ARDEN, the woodland district of the county of Warwick. This name, which, from its occurrence in the northern part of France and elsewhere [see ARDENNES], we may suppose was a common Celtic designation for a forest, was given to this most extensive of the antient British forests. It is said to have reached from the banks of the Avon to the Trent on the north, and to the Severn on the west; and to have been bounded on the east by an imaginary line from Burton upon Trent to High Cross, the point of intersection of Watling Street and the Foss-way on the border of Warwickshire and Leicestershire. Drayton, in his 'Poly-olbion,' (the 13th song,) says,

That mighty Arden held, even in her height of pride;
Her one hand touching Trent, the other Severn's side.

Upon the division of England into shires, this immense wild was divided between different counties, and only that part which was included in Warwickshire retained its name: though perhaps 'Dean,' the name of a forest on the borders of Gloucestershire and Monmouthshire, may be a relic of it.

Although there is no longer a continuous forest in this district, yet it is still the best wooded part of the county, affording plenty of timber, consisting of almost all kinds of forest trees, but especially oaks.

Several places preserve the name, as Henley in Arden Hampton in Arden, &c. (Drayton's *Poly-olbion*, with Sel den's illustrations; *Beauties of England and Wales*; Marshal's *Review of the Agricultural Reports of the Midland Counties*.)

ARDENNES, a mountainous, or rather hilly region on the northern frontier of France, between the rivers Meuse and Moselle, situated partly in France, in the Grand Duchy of Luxembourg, in the Rhenish provinces of Prussia, and in Belgium. The name of the region is antient; the Arduenna Silva is mentioned by Julius Cæsar (*Bell. Gall. l. v. vi.*) by Strabo (*Geogr. l. iv.*), and by Tacitus (*Ann. l. iii. 42*). Ardennes is the name of one of the northern departments in the modern subdivision of France, and is a part of the antient provinces of Picardy and Champagne. The Ardennes, or, as the region is sometimes called, the Forest of Ardennes, extends from the hills of Thiérache in Picardy, on the left of the Meuse, to those of the Hautes Fagnes and the banks of the river Roer, in the form of a half moon; and the hilly parts of the Duchy of Luxembourg, as well as the mountainous district called the Eifel, which extends to the Rhine, and contains numerous extinct volcanos, belong to the same system. The mean elevation of the Ardennes, according to Dumont (*Mémoire sur la Constitution Physique de la Province de Liège, Bruxelles, 1832*), is about 470 metres, or 1540 English feet, above the level of the sea; its highest point, La Baraque Michel, is 680 metres, or 2230 feet. The mountain Schneifel, in the environs of Prum, according to Steininger, is 2132 feet. Omalius d'Halloy, in his *Mémoires Géologiques*, observes, that the Ardennes afford a proof that the direction of streams is not always a sure indication of the general slope of a country; that the table-land of Langres, in the department of the Haute Marne, which forms the water-shed of rivers which flow into the North Sea, the Atlantic, and the Mediterranean, has, on that account, been considered as one of the most elevated parts of France, and that it has been supposed that, from that point, there is a slope to the north, west, and south; that the table-land of Langres is only 1495 feet above the level of the sea, whereas the river Meuse, which rises at the foot of it, traverses, between Mezières and Givet, 136 miles to the north, a table-land which has an elevation of more than 1640 feet. The Ardennes, although a high region, cannot be called mountainous; there are extensive tracts where only very low hills or gentle undulations are observed. But in those parts which are traversed by the more considerable rivers, such as the Meuse, the Semoy, the Ourte, the Sure, the Warge, and the Roer, the surface is broken into a multitude of valleys, and extremely deep and often very narrow gorges, with steep sloping or precipitous sides, 650 feet high. These great water-courses form, as it were, principal trunks from which a number of secondary valleys branch off, furrowing the whole surface of the neighbouring country. Thus the Ardennes contain both hilly and flat districts; but these last are lofty table-lands, having the same general elevation above the sea, and being composed of the same materials.

The prevailing rocks of the Ardennes are clay-slate, grauwacke-slate, grauwacke, conglomerate, quartz-rock, and quartzose sandstones in various modifications of colour and internal structure, with now and then, but very rarely, some thin beds of limestone and of calcareous conglomerates. These rocks are in strata generally bearing N.E. and S. W., often highly inclined, sometimes vertical, but seldom, if ever, horizontal. They maintain a considerable uniformity both of composition and stratification throughout large tracts. The slaty rocks are abundant, and afford, in some places, excellent roofing slates; there are extensive quarries of these along the banks of the Meuse, and they are carried to great distances from the facility of the river-navigation. Excellent whetstones, both for coarse and fine cutlery, are largely exported. The Ardennes have hitherto proved but poor in metallic substances except iron; but the lead-mines of Longvilly and the antimony-mines of Goesdorf were productive. Near Lierneux, an oxide of manganese is worked

in a mine open to the day. On the borders of the region towards the west there are some rich iron mines. The celebrated mineral waters of Spa issue from these slaty rocks.

The country of the Ardennes is in general sterile; and even in the best part of it, which constitutes the French department of Ardennes, there is only about a third of the land in cultivation. There are vast heaths and extensive marshes which can only be approached in the three driest months of the year. These heaths are called Fagnes, and the most elevated part of the region on the south-east is called Les Hautes Fagnes. There are extensive forests of oak and beech; more rarely, of alder, ash, and birch. Pines and firs occur but seldom. The people of Belgium, living on the borders of the Ardennes, call them the *Neur-Paï*, that is, *Noir-Pays*, 'black country,' because it contains no limestone, and because the only grains cultivated are rye and dwarf oats. Around the villages there are patches of land which have been brought into cultivation by means of a process of paring and burning, called *essartage*: it consists in taking off the turf and burning it on the ground, and by this process the soil is rendered capable of yielding three successive crops; the first year, rye, generally of a very good quality; the second year, oats; and the third year, potatoes; but after these crops have been got off the land, it must lie fallow for six, twelve, or even twenty years. Meadows and regularly cultivated lands occur only in the valleys. The rearing of cattle, sheep, and horses, is carried on to a great extent. The mutton is celebrated for its excellence, but the wool is not in such high repute. A great deal of ewe-milk cheese is made. The oxen, sheep, and horses are of a small breed. The hardy and valuable Ardennes ponies and little horses appear to be indigenous. They were as highly esteemed in ancient times as they are in the present day; for at the time of the invasion of Gaul by the Romans, the cavalry of the Treviri, in which this particular breed was employed, was esteemed the best in Gaul.

ARDENNES, a department in the north of France, on the frontier. It is bounded on the N. and N.E. by the kingdom of Belgium, E. by the department of Meuse, W. by that of Aisne, and S. by that of Maine. Its length is about sixty-five miles N. and S., and its breadth sixty miles from E. to W. Its superficial extent is 1955 English square miles, and the population about 282,000, being about 144 to a square mile.

This department is traversed by ridges which may be regarded as remote branches of the Vosges, and which separate the waters of the basin of the Meuse from those of the Seine. The streams which flow from the N.E. slopes of these ridges fall into the Meuse; the Bar (which is navigable for several miles) just below Donchery, the Vence, and the Sormonne, near Mezieres, and the Faux and the Viroin, a considerable way farther down. The Meuse itself traverses the department in a direction S.E. and N.W. nearly parallel to and not very far from the Belgian frontier; it then turns more towards the N., and waters a portion of the French territory which projects into the kingdom of Belgium. It receives the abovementioned streams on its left bank: on the right it receives the Semoy, which has the greater part of its course in the Belgian territory. The Aisne forms an arc in the southern part of the department, flowing in a direction which may be described as, on the whole, E.S.E. and W.N.W.; it receives the Vaux on its left bank from the range of heights above alluded to; and falling into the Oise, far beyond the limits of the department, ultimately joins the Seine. Its navigation begins at Château Portien, a little before it leaves this department. Some of the other feeders of the Oise rise just on the eastern border of Ardennes.

The elevations in this department appear from their steep declivities and rugged summits to be more lofty than they really are. They afford excellent slates, equal in quality to those of Angers, though not so deep in colour. (*Encyc. Méthod.*; *Géog. Physique*, Art. ARDOISES.) Slate and stone are quarried to a considerable extent. Coal, iron, and some lead, are also worked: the great quantity of wood which the department produces, furnishes fuel for considerable iron works.

These heights were once covered with an immense forest. Cæsar (*Comment. de B. G. lib. v.*) describes it as spreading 'in vast extent through the middle of the country of the Treviri (people of the diocese of Trèves, now included in the Prussian Grand Duchy of the Lower Rhine), from the river Rhine to the beginning of the territory of the Remi' (the

people about the present town of Rheims). In another place (*Comment. de B. G. lib. vi.*), he speaks of it as 'the largest forest in all Gallia,' and says, 'that it stretches from the banks of the Rhine and the country of the Treviri, to the lands of the Nervii' (who dwelt in the present country of Flanders), 'and extends above 500 miles in length*.' But this measure is so great that some error in the text has been suspected. In some documents of the German empire of the dates 1001, 1003, A.D., the name Arduenna is applied to a canton of Westphalia bordering on the diocese of Paderborn. If the word signified a forest [see ARDEN], it accounts for the fact that the Roman goddess of forests, Diana, appears sometimes with the epithet Arduenna: and Montfaucon shows that a superstitious belief in this goddess existed in the Ardennes till the thirteenth century.

Strabo speaks of it as a large forest, consisting of not very lofty trees. (*Geog. lib. iv.*) Though now much reduced, it renders the department which bears its name one of the best wooded in France. It occupies a considerable extent on the banks of the Meuse below Charleville, and encompasses the plain in which the town of Rocroy stands. The timber which it furnishes, besides supplying the forges or manufactories, forms one of the chief articles of commerce. The agricultural produce of the department is not sufficient to supply the wants of the inhabitants. Their timber, slates, metals, and woven fabrics are exchanged for the corn and wine of more fertile districts. The southern parts contain the most pasturage and corn land.

The chief manufactures carried on in this department are of cloth and woollen stuffs, at Sedan and Rethel; cutlery, hardwares, nails, and fire-arms, at Charleville; leather, which is in good repute; hosiery, hats, serges, &c.

The chief towns are Mézières, the capital (population 4000), Rethel (population 6000), Rocroy (population 3500 or 4000), Sedan (population 13,000), and Vouziers (population under 2000); all which are seats of sub-prefects; Charleville (population 8000), which is separated from Mézières only by the Meuse; and Charlemont, with Givet, Notre Dame, and Givet St. Hilaire, which form one town with a population of about 4000. Several of these being on the frontier are fortified,—Mézières, Rocroy, Sedan, and Charlemont with the Givets. For a further account of these towns, see CHARLEVILLE, CHARLEMONT, ME'ZIE'RES, RETHEL, ROCROY, SEDAN.

This department is included in the archbishopric of Rheims, and is under the jurisdiction of the *Cour Royale* (Assize Court) of Metz. It sends three members to the Chamber of Deputies. (Malte Brun; Balbi; *Encyc. Méthodique*; *Diction. Géog. de la France*, &c.)

ARDESHIR. [See SASSANIDE.]

ARDFERT, called antiently ARDART, ARDFEART-BRENN, or ARDBREINN, a decayed city of Ireland, in the barony of Clanmaurice, county of Kerry; 184 English miles S.W. by W. from Dublin, and about four N.N.W. of Tralee. Although now much reduced, its former importance and its episcopal rank entitle it to notice. The see of Ardfert was erected in the fifth century, and was so early united with that of Aghadoe that they now form but one diocese, comprehending the county of Kerry and part of Cork, and containing eighty-eight parishes, and forty-nine benefices. In 1663, the united sees were added to that of Limerick, but without incorporation. The chapter of Ardfert consists of five dignitaries, viz., dean, precentor, chancellor, treasurer, and archdeacon, but no prebendaries; only the archdeacon of Aghadoe has a stall. The five dignitaries above-mentioned have the cure of souls in the parish of Ardfert, and contribute each one-fifth to the curate's salary. The parish church serves as the cathedral, and is the relic of a very extensive edifice, the rest of which was demolished in the wars of 1641.

The ruins of the nave and choir are twenty-six yards long and ten broad. There are the remains of an aisle on the south side, and there was probably one on the north side, which was rebuilt not long before the demolition of the church in 1641. Towards the west end of the cathedral, there are two detached chapels, said to have belonged to the dignitaries of the cathedral, one of them bearing marks of remote antiquity. Opposite the west door was formerly one of the an-

* As the Roman mile was about 1.125ths of our mile, the distance will be about 459 English miles—which is impossible: for it is little more than 300 Roman miles from the Rhine at Strasburg to the coast of Flanders. And Strabo expressly says, the forest was not of the extent which some writers assign to it, mentioning 4000 stadia as the exaggerated dimensions, which are equal to Cæsar's measurement. Eight stadia are equivalent to one Roman mile.

tient round towers (see *ANTRIM town*) nearly a hundred feet high, and built mostly of a dark kind of marble; but this fell in the year 1770 or 1771. The area of the cathedral is crowded with tombs, on one of which is the effigy of a bishop rudely sculptured in relief.

Ardfert was once the capital of Kerry, and had a university of high repute. The bishops were antiently called bishops of Kerry. St. Brendan, or Brandon, to whom the cathedral was dedicated, erected a sumptuous abbey here in the sixth century, but it was burned, as well as the town, in 1089. The town suffered a similar fate again in 1151 and 1179, on which last occasion the abbey was entirely destroyed.

Within the demesne formerly belonging to the earls of Glandore and barons of Ardfert (titles now extinct) are the remains of an antient monastery, forming a most picturesque addition to the grounds. These remains, according to Sir R. C. Hoare, who visited them in July, 1806, consist of the tower, nave, and a great part of the cloisters, which are in tolerable preservation. The architecture of the building does not bespeak a very antient date. There is some difference of opinion as to its origin; Smith (*Nat. and Civ. Hist. of Kerry*) ascribes its foundation to Thomas, Lord of Kerry, in 1253, in which he is followed by Archdale (*Monast. Hibern.*); others ascribe it to a baron of Kerry, in 1389. It is thought to occupy the site of the former monastery founded by St. Brendan, and was destroyed when the town was burnt in the years 1089 and 1179.

There are three fairs in the year. The population amounted, in 1821, to 629 in the town, or 2481 in the whole parish. It was a parliamentary borough before the Union, and sent two members to the Irish House of Commons; it is still governed by a portreeve and twelve burgesses. In 1821, there was an Hibernian Society school of forty boys and twenty-one girls. 52° 19' N. lat., long. 9° 39' W. from Greenwich.

Ardfert is so near the sea, that single trees, or even rows, are destroyed by the wind; yet there are fine plantations in the grounds of the late Earl of Glandore.

ARDGLASS, a town in Ireland, in the barony of Lecale, county of Down, a short distance E. by N. of the town of Killough, which is 100 miles N. by E. of Dublin. It lies upon the east side of the tongue of land which separates the bay of Killough from that of Ardglass; the road between the two towns leads round the head of the first-named of these bays, a distance of about five miles, but this may be very much shortened by crossing the sands when the tide permits.

Ardglass lies on a small rocky bay or creek about 150 fathoms wide, and extending, at high water, 500 fathoms inland, with three or four sandy coves along its shores, divided from each other by rocky ledges. The outer of these ledges on the west side has been built up so as to form a kind of pier, at the extremity of which is a light-house; and as there are always three or four fathoms water at the entrance, it may be run for at night, even at low water. The harbour is, however, far from secure when the south-east wind, the most violent on this coast, sets in. (*Report of the Commissioners of Irish Fisheries for 1822.*) It is inhabited chiefly by fishermen. The population of the whole parish was only 976 in the year 1821, the inhabitants of the town not being discriminated. It is the centre of one of the districts or stations into which the Irish fisheries are divided. In the year ending the 5th of April, 1830, there were employed within the district 208 sailing and 300 row-boats; 2441 fishermen, and probably about 300 other persons, as fish-curers, net-makers, coopers, sail-makers, and other artificers connected with the fisheries, and depending on them for support. In 1822 there were two packets to the Isle of Man. The harbour has been within a very few years substantially repaired by W. Ogilvy, Esq., and government have lately made a grant towards the erection of a pier. There is in the town a school on the foundation of Erasmus Smith, the school-house for which was built by Mr. Ogilvy: it contained in 1826 about 120 pupils, half of whom were boys and half girls.

Ardglass was once a corporate town of considerable importance, both as a seat of commerce and a military post. In the time of Queen Elizabeth it was, next to Newry and Down, the principal place in the county. Some authorities make it the second town for trade in all Ulster, Carrickfergus being the first. Several remains attest its former strength and greatness. A range of buildings 234 feet long

and 20 broad in the clear—(250 feet long and 24 broad, according to Seward, *Topogr. Hibern.*, which are probably the exterior dimensions.)—is situated close by the harbour, and washed by the sea on the north end and the east side. On that side there are only spike-holes; but on the west side, or front, are sixteen arched stone doors, alternating with fifteen square windows; there are also three towers, two connected with the building, the third, now a little detached, but which probably at first constituted one extremity, as the remaining two towers occupy the centre and the other end of the building. The whole building has been divided into small apartments in two ranges, one over the other, with a staircase in the centre. The lower rooms are about seven feet high; the upper, six and a half; there is a small water-closet in each of the latter, the drain running down through the wall into the sea. The towers have each three rooms, ten feet square, with broad-flagged floors supported without any timbers. The building is surmounted with a battlement, at least on the side next the sea.

This singular erection is termed by the inhabitants the 'new works,' although they have no tradition as to its use, which, however, its construction seems sufficiently to point out. It appears to have been intended for the secure deposit and sale of the goods of some merchants who came from beyond sea. About ten feet from the south tower of this building is a square tower, forty feet by thirty, (we know not whether these are the inside or the outside dimensions, but we believe them to be the latter,) consisting of two stories, and called Horn Tower, from the quantity of horns of oxen and deer found about it. It is thought to have been the merchants' dining-hall and kitchen, from the fire-places and other marks about it. There are at Ardglass three castles, called King's Castle, Cowed (or Coud) Castle, and Jordan's Castle. The last, though not so large as King's Castle, is a finer building than any of the rest. In the great rebellion of Tyrone (in the reign of Elizabeth) it was defended by Simon Jordan, the owner, for three years, until the garrison was relieved by the Lord Deputy, Mountjoy.

The parish of Ardglass is in the union (*i. e.* united parishes) of Ballyphilip, in the diocese of Down, and ecclesiastical province of Armagh; but it has been erected into a perpetual curacy, and a new church built. The old church of Ardhol was the parish church, but was desecrated by the dreadful massacre of the whole congregation at the Christmas midnight mass by the sept (clans) of the McCartans. (*Antient and Present State of the County of Down; Seward's Topogr. Hibernica; Parliamentary Papers.*)

ARDNAMURCHAN. [See ARGYLESIRE.]

ARDOCH, a village in Scotland, in the district of Strathallan, county of Perth, where there are the remains of a permanent Roman station, supposed to be in the most perfect preservation of any in the island, and the traces of three temporary Roman camps. The station is on the right of the great military road from Stirling through Crieff to the north Highlands, and close upon the little river Knaik or Knaig, a feeder of the Allan, which falls into the Forth.

This station is supposed, by General Roy, to be the Lindum of Richard of Cirencester*; and to have been founded by Agricola in one of his northern campaigns, perhaps in the fourth. It was on a road carried by the Romans from the wall erected by them between the Firths of Forth and Clyde into Strathmore beyond the Tay, and which crosses the river Knaig immediately below the station. The accompanying plan, from General Roy's *Military Antiquities of the Romans in Britain*, will show the great pains taken to strengthen it. Its form, according to the general practice of the Romans, is rectangular; its dimensions are about 500 feet by 430 within the entrenchments; and its four sides nearly face the four cardinal points. On the north and east sides, where the works are most perfect, there are five ditches and six ramparts. From the nature of the ground the direction of the outer rampart varies, but the aggregate breadth of the works on the east side, where intersected by the line A B, is about 150 feet, and that of the works on the north side, where intersected by the line C D, is more than 270 feet. The praetorium, or general's quarter, is near the centre, but not in it; it is a rectangle, and almost a square, having its greater side about 70 feet, but its sides are not parallel to those of the station. On the south side of the latter the works have been much defaced by the process of cultivation, and

Section made in the direction of the line A B.

Section made in the direction of the line C D.

on the west by the modern military road from Stirling towards Inverness. Three of the gates remain. The entrance at the prætorian gate crosses the entrenchments, not at right angles, but obliquely. There is a road out of the camp on the south side; but whether it coincides with the remaining (*decuman*) gate is not clear from the plans. The Roman stations and camps had usually four gates: the Prætorian, in front of the prætorium or general's quarters; the Decuman, at the back of the same; and the right and left principal gates. From an inscription on a sepulchral stone dug up at this place, it appears that a body of Spanish auxiliary troops lay in garrison here.

The west side of the camp is protected by the river Knaig, the banks of which, as the section shows, are very steep. The level of the camp is sixty feet above the river. The prætorium, which has from time immemorial been called Chapel Hill, has been at some time enclosed with a stone wall, and has the foundations of a house ten yards by seven. The whole station has been of late years enclosed with a high stone wall in order to preserve it.

There is said to be on one side of the prætorium a subterraneous passage, supposed to extend under the bed of the

river, but the entrance having been closed about 1720, to prevent hares, when pursued, from taking refuge there, it is not known where the passage is. Search has been made for it, but in vain. Previous to its being closed, a man who had been condemned in the baron court of some neighbouring lord, consented, upon condition of pardon, to explore it; but after bringing out some Roman spears, helmets, and bits of bridles and other things, he descended again and was killed by the foul air. The articles brought out were carried off by the duke of Argyle's soldiers after the battle of Sheriffmuir in 1715, and were never recovered.

The camps are a little way north of the station on the way to Crieff, and are of different magnitudes. The largest of them has a mean length of 2800 feet, and a mean breadth of 1950, and was calculated to hold between 25,000 and 26,000 men. The military road enters the camp by the south gate, and has levelled half of the small work which covered it, leaving the other half of it standing. On the east rampart of this camp is a small redoubt, on a gentle eminence; the only thing of the kind in the temporary camps of Agricola in these parts. The area of this camp is marshy, and some parts of it appear to have been always so.

The second camp is smaller, and its ramparts obliquely intersect those of the last. The north end and part of the east and west sides remain entire. Its length is 1910 feet, and its breadth 1340, and it would contain about 14,000 men, according to the Roman method of encamping. The area is drier than that of the great camp. These camps Roy supposes to have been formed and occupied by Agricola in his sixth campaign: the smaller one after the larger, when he had divided his forces. The part of the rampart of the first included within the second was not levelled. The lower parts of both, where they approach the river Knaig, are now demolished.

The third camp is immediately adjacent to the station, and was probably an addition to it. Its mean length is 1060 feet, and its mean breadth 900, so that it would contain about 4000 men. It was stronger than the great camp, and was formed subsequently to it, the works of the great camp having been defaced by its rampart, and the part included within it has been levelled either by the Romans or others since their time.

In this part of Scotland are the remains of two other Roman stations, but neither of them are so perfect as that at Ardoch. One of them; at Strageath or Strathgeth, on the river Earn, about six miles and a half N.N.E. of Ardoch, is thought to be the Hierna of Richard of Cirencester; and between this and Ardoch, about two miles and a half from the latter, is a small post called Kaim's Castle, supposed to have been a look-out for both stations, the remains of which are very perfect.

The other station, of which only slight vestiges remain, is in the neighbourhood of West Dealgin Ross, near the junction of the rivers Ruagh Huil and Earn, about eight miles and a quarter N.N.W. from Ardoch, and eight and a half W.N.W. from Strageath. Near it are the remains of a small temporary camp, whereof great part of the intrenchments and the four gates (which are covered in a manner singularly curious) remain entire. This station General Roy supposes to be the Victoria of Richard of Cirencester, and the camp that of the ninth legion, which was attacked by the Caledonians in the sixth campaign of Agricola. About half a mile S.W. of Ardoch, at the Grinnan Hill of Keir, is a circular Roman work. (Roy's *Military Antiquities of the Romans in North Britain*; Sir John Sinclair's *Statistical Account of Scotland*.)

About a mile west of Ardoch was a cairn of extraordinary dimensions, viz., 182 feet in length, 30 feet in sloping height, and 45 feet in breadth at the base. (Gordon's *Itinerarium Septentrionale*.) The stones have been now mostly carried away to form enclosures for the neighbouring farms; but a large stone coffin, in which was a skeleton seven feet long, has been preserved, together with a few large stones around it. (Sir John Sinclair's *Statistical Account of Scotland*.)

ARDROSSAN, a sea-port and parish in the district of Cunningham, the most northern division of Ayrshire in Scotland. The harbour of Ardrossan was begun in 1806. The port had previously considerable natural advantages, being sheltered by a large island (Horse Island) off the coast. The works were carried on under the auspices of the late earl of Eglinton, who bestowed upon them much trouble and expense. The harbour was to form one outlet of a canal intended to connect the Clyde with this part of the coast, and the projectors seem to have hoped to render Ardrossan the port of Glasgow. The harbour has been for many years in a state to receive shipping, and is considered as one of the safest and most capacious and accessible on the west coast of Scotland. A circular pier of 900 yards* was finished in 1811; but the progress of the wet dock and other works was suspended by Lord Eglinton's death in 1820. The canal (begun in 1807) has never been finished. It has been carried from Glasgow past Paisley to the village of Johnston, a distance of eleven miles, at an expense of 90,000*l*. A rail-road has been commenced from Ardrossan to the canal, which will thus complete the communication, though not in the manner first designed. Baths have been constructed at Ardrossan, which render it somewhat attractive as a watering-place.

There are some ruins of an old castle, the remains of which indicate it to have been of considerable extent. It was in a great degree demolished by Cromwell, who used the stones of it for the erection of the fort of Ayr.

This is the statement in the *Encyc. Britannica*, last edition; but we suspect some error. Two statements of the plans of Mr. Telford, the engineer, give 900 yards as the intended length of this pier.

The parish has a medium length of six miles. Its greatest breadth is about five miles, and its least not more than three. The kirk is close to the town of Saltcoats, part of which is in this parish. [See SALTCOATS.] The population in 1831 was 3494. Ardrossan is in the presbytery of Irvine, and the synod of Glasgow and Ayr. It gives the title of baron to the family of Montgomery, earls of Eglinton. (Sinclair's *Statistical Account of Scotland*, &c.)

ARDSTRAW, an extensive parish in Ireland, in the county of Tyrone. [See NEWTON STEWART.]

ARE, the modern French measure of surface, forming part of the new decimal system adopted in that country after the revolution; it is obtained as follows:—the metre or measure of length, being the forty-millionth part of the whole meridian, as determined by the survey, is 3'2809167 English feet; and the *are* is a square, the side of which is 10 metres long. The following denominations are also used:—

Decare . . .	is	10 arcs.
Hectare . . .	"	100 "
Chilare . . .	"	1000 "
Myriare . . .	"	10,000 "
Deciare . . .	"	$\frac{1}{10}$ of an are.
Centiare . . .	"	$\frac{1}{100}$ "
Milliare . . .	"	$\frac{1}{1000}$ "
The are is . . .		100 square metres,
or . . .		947'68175 French sq. feet,
or . . .		1076'44144 English sq. feet.

The hectare is generally used in describing a quantity of land. It is 2'4711695 English acres, or 404*½* hectares make 1000 acres, which disagrees with the first result by less than 1 part out of 50,000.

A'REA. This term is a Latin word, and means the same thing as *superficies* or *quantity of surface*, but is applied exclusively to plane figures. Thus we say, 'the *surface* of a sphere, the *area* of a triangle,' and 'the *surface* of a cube is six times the *area* of one of its faces.' The word is also applied to signify any large open space, or the ground upon which a building is erected; whence, in modern built houses, the portion of the site which is not built upon is commonly called the *area*.

Returning to the mathematical meaning of the term, the measuring unit of every area is the square described upon the measuring unit of length: thus, we talk of the square inches, square feet, square yards, or square miles, which an area contains. And two figures which are *similar*, as it is called in geometry, that is, which are perfect copies one of the other on different scales, have their areas proportional to the *squares* of their linear dimensions. That is, suppose a plan of the front of a house to be drawn so that a length of 500 feet would be represented in the picture by one of 3 feet. Then the area in the real front is to the area of the front in the picture in the proportion of 500 times 500 to 3 times 3, or of 250,000 to 9. Similarly, if the real height were 20 times as great as the height in the picture, or in the proportion of 20 to 1, the real area would be to that of the picture as 20 times 20 to once one, or as 400 to 1, that is, the first would be 400 times as great as the second.

Any figure which is entirely bounded by straight lines may be divided into triangles, as in the adjoining diagram.

The area of every triangle may be measured separately by either of the following rules; in which the word in *italics* may mean inches, yards, miles, or any other unit, provided only that it stands for the same throughout. 1. Measure a side, A B, of the triangle A B C, and the perpendicular C D which is let fall upon it from the opposite vertex, both in *units*. Half the product of A B and C D is the number of square *units* in the triangle A B C. Thus, if A B be 30 yards, and C D 16 yards, the triangle contains 240 square yards. 2. Measure the three sides, A C, C B, B A, in *units*; take the half sum of the three, from it subtract each of the sides, multiply the four results together, and extract the square

root of the product; this gives the number of square units in the triangle. For instance, let the three sides be 5, 6, and 7 inches; the half sum is 9: which, diminished by the three sides respectively, gives 4, 3, and 2: 9, 4, 3, 2, multiplied together, give 216, the square root of which is $14\frac{7}{8}$, very nearly. The triangle, therefore, contains about $14\frac{7}{8}$ square inches.

The following rules may be applied in the following cases—for a parallelogram, multiply AB , a side, by CD , its perpendicular distance from the opposite side—for a rectangle, multiply together adjoining sides, PQ and PR —for a four-sided figure, in which RT and SV are parallel, but TV and RS converge; multiply RS , one of the converging sides, by YZ , its perpendicular distance from the middle point of the other. When RT and SV are perpendicular to RS , then YZ is half the sum of RT and SV .

To find the area of a circle, multiply the radius OA by itself and the result by 355; then divide by 113. To find the area of the sector $OADB$, see *ANGLE*. To find the area of the portion ABD , find those of the sector $OADB$, and the triangle OAB separately, and subtract the second from the first. In all these cases, the result is in the square units corresponding to the linear units in which the measurements were made.

The area of a curvilinear figure can only be strictly found by mathematical processes too difficult to be here described, but the following method will give an idea of the principles employed. Let $ACDB$ be a curvilinear figure bounded by the curve CD and the lines CA , AB , BD , of which the first and third are perpendicular to the second. Divide AB into any number of equal parts (eight is here supposed) by the points 1, 2, 3, &c. and construct the accompanying obvious figure by making Ap , $1q$, &c. parallelograms. It is plain that the area sought, $ACDB$, is

greater than the sum of the inscribed rectangles, denoted by the letters or numbers at opposite corners,

$1C$, $2p$, $3q$, $4r$, $5s$, $6t$, $7u$, Bv ;

and that it is less than the sum of the circumscribing rectangles

Ap , $1q$, $2r$, $3s$, $4t$, $5u$, $6v$, $7D$.

Therefore the area sought does not differ from either of these sums by so much as they differ from one another; but the sums differ from one another by the sum of the rectangles

Cp , pq , qr , rs , st , tu , uv , vD ,

which, placed under one another, give the rectangle DE , which is less than $D7$: consequently neither sum differs from the area sought by so much as $D7$. But by carrying the division of AB , with which we set out, to a sufficient degree, the area of $D7$ might have been reduced to any extent which might have been thought necessary; that is, name any fraction of a square inch, however small, and AB can be divided into such a number of equal parts that $D7$ shall be smaller than that fraction of a square inch. Hence the sum of the inscribed or circumscribed parallelograms may, by dividing the line AB sufficiently, be made as nearly equal to the area as any practical purpose can require.

The accuracy of the preceding process will be increased by summing, not the parallelograms, but the figures

$ACp1$, $1pq2$, $2q r 3$, &c.

considering Cp , pq , qr , &c. as straight lines. This will be equivalent to adding half the rectangle, DE , to the sum of the rectangles aforesaid. The practical rule is:—Add all the intermediate ordinates, $1p$, $2q$, &c. to the half sum of the extreme ordinates AC and BD : multiply the total by the common value of $A1$, or 12 , &c. This approximation is the first step of the method of *QUADRATURES*, which see.

The mathematical process of finding the area carries the preceding approximation one step further, and finds what is the limit to which the sum of the inscribed parallelograms approaches nearer and nearer, as the number of divisions of AB is increased. This limit, it is easy to show, is an exact expression for the area required. If x represent one of the lines $A1$, $A2$, &c., and y the corresponding line $1p$, $2q$, &c., the area of the curve is found by the process of the integral calculus thus represented:

$$\int y dx$$

or, in the language of fluxions,

fluent of $y x$

A process similar to the preceding is employed by surveyors in measuring a field whose boundaries are curvilinear. [See *SURVEYING*, *OFFSET*.]

The investigation of the area of a curve was formerly called the *quadrature* of the curve (*quadratum*, a square), because, before the application of arithmetic to geometry, the most convenient method of representing an area was by giving the square to which it is equal.

For some practical purposes the following experimental method of finding the above area might suffice. Cut out the figure $ABCD$ in pasteboard (heavy wood or metal would be better). Out of the same pasteboard cut a square inch or other unit; and weigh both the pieces thus cut out accurately. Then the weight of the first piece divided by that of the second will give the number of square units in the area required, if the pasteboard, or other material, be of moderately uniform thickness. A method similar to that of Archimedes (see his *Life*) might easily be devised.

ARECA, a genus of palms containing two species, both remarkable for the purposes to which they are applied. Botanically, areca is distinguished by a double membranous sheath in which its bunches of flowers are contained, by its female corollas containing the rudiments of stamens, its calyx being divided into three parts or leaves, and its fruit

[*Areca catenata*.]

being a berry or drupe, with a fibrous rind inclosing one seed only. The leaves of all the species are pinnated, with their stalks rolled up cylindrically at the base.

Areca catechu is described by Dr. Roxburgh as being the most beautiful palm in India, with a remarkably straight trunk, often from forty to fifty feet high, and in general about twenty inches in circumference, equally thick in every part, and smooth. The leaflets are from three to three feet and a half long, and widest at the point, where they also are ragged. It is cultivated all over India for the sake of its nuts, which are about the size of a hen's egg, of a reddish-yellow when ripe, and with a firm fibrous rind about half an inch thick. It is this nut, which, under the name of pinang or betel nut, is so universally chewed in the East Indies. It has an austere and astringent flavour, and is not eatable alone; but mixed with lime, which no doubt destroys its acidity, and with the leaf of the betel pepper, it becomes milder and pleasant. The mixture is, however, after all, so hot and acrid as to be unfit for the use of any but persons accustomed to it; it is said to be aromatic and stomachic, and also to produce intoxication in beginners, but it is very doubtful whether all these qualities are not rather to be ascribed to the betel pepper leaf than to the nut of the palm. It, or rather the mixture of the three substances, stains the saliva and teeth of a deep red colour. It is to the stems of *Areca catechu* that the common black pepper vine is usually trained on the coast of Malabar. (Roxb.) The astringent substance called catechu was once supposed to be produced by it, but this was an error, as has been already explained. [See ACACIA CATECHU.]

Areca oleracea, or the cabbage palm, is the only other species that it is necessary for us to notice. This plant must be familiar to most persons in consequence of the allusions to it in the tale of *Paul and Virginia*, and from the often repeated fact that a tree of the growth of half a century is sometimes cut down for the sake of the single bud which terminates it, and which is called the cabbage.

The species is found in great abundance in the mountainous parts of Jamaica and other West India islands, growing to the height of from one to two hundred feet, with a trunk not more than six or seven inches in diameter. This gives it an extremely graceful appearance, especially as the leaves grow from the top only, in a kind of tuft or plume, to the length of fifteen feet; these leaves are divided in a pinnated manner, and their divisions are deep green, and several feet long. The unexpanded leaves are arranged so closely one over the other as to obstruct all access of light, which causes them to be of a very tender and delicate nature. It is this which forms the cabbage, which is considered a great delicacy, either raw or boiled. The nuts, which are about the size of a filbert and covered with a yellowish skin, are produced in great abundance upon a very long and branched spadix; the kernel is white and sweet.

Independently of the use of this palm as an article of food, its trunk when felled and exposed to the air quickly rots in the centre, and becomes a natural hollow cylinder, which, on account of the hardness of its outside, forms a very durable water-pipe, often as much as a hundred feet long, and is said to become, when buried, almost as hard as iron. (See *Sloane's Jamaica*, vol. ii. p. 116.)

AREMBERG is a considerable duchy close upon the Dutch frontier: it consists of the sovereignty of Meppen, which formerly belonged to the Westphalian bishopric of Münster, but is at present within the Hanoverian dominions; of Recklinghausen; of another sovereign domain in the circle of Münster, within the Westphalian dominions of Prussia; and of extensive possessions in the Netherlands. The ancestors of the present duke were created counts of the Roman empire in 1549; they were advanced to the rank of princes in 1576; and were ultimately created sovereign-dukes by the emperor Ferdinand III. in 1644. As a compensation for the loss of a considerable part of the duchy on the Upper Rhine and in the Netherlands under the stipulations of the treaty of Luneville, the then duke received Meppen and Recklinghausen, which are six times greater in extent, and produce double the revenue of the lost territory. The dukes of Aremberg, besides being grandees of Spain of the first class, are subject to the crown of Prussia as holding Recklinghausen, and to the Hanoverian crown as holders of Meppen. The late duke was created duke of Aremberg-Meppen by George IV. in 1826. His ancestor, Prince Leopold, who died in 1754, was a Field-Marshal in the Austrian service, and took a distinguished part in the

Italian and German campaigns, which arose out of the contest for the succession to the empire, in the days of the empress Maria Theresa.

The present extent of this duchy, independently of the Belgian domains, is 920 geographical square miles; the amount of its German population above 85,000; and the yearly income from its possessions both in Germany and Belgium is estimated at nearly 70,000*l.* Meppen, which fell to the house of Aremberg in 1803, and became part of the French empire in 1810, being afterwards made over to Prussia, was relinquished by that power in favour of the king of Hanover in 1815, when it was erected into a duchy, with a seat in the Upper Chamber of the Hanoverian states. The 690 miles over which it spreads are the most cheerless, sterile tract in the whole kingdom; in fact, it is an extensive plain, in which heath alternates with morass; the inhabited parts exhibit the appearance of so many islands, and are almost as inaccessible as the Oases in the African desert. The heart of the land, which is denominated the 'Humling,' is an immense moor of sand, above twenty miles in circumference, the whole surface of which presents a wide covert of heath, interspersed with sandstones, and surrounded at every point by impenetrable morasses. This inhospitable region is traversed by the Ems in the west, and the Hase, which flows into the former, in the south; it is also watered by the north and south Raate, the first running into the Ems, and the second into the Hase. Its climate is temperate, but moist, gloomy, and variable. The districts where rye and buckwheat are grown do not produce enough by one-half for the wants of the inhabitants; the growth of flax also is much less than adequate to their consumption; but the principal and the richest source of profit is the breeding of horned-cattle, sheep, and bees. Wood or orchard is unknown to them; but they have turf in sufficient quantity both for fuel and as an article of exportation. There is scarcely a mechanic among them, unless the domestic weaver and knitter deserve the name: for their shirts, stockings, and garments are all made at home. In short, Meppen is so poor that the greater part of the inhabitants make their way into Holland for the sake of finding better bread in the summer season, and returning home with the surplus produce of their labour before winter sets in. The present number of its inhabitants, who are wholly Catholics, is about 43,000; and its revenue amounts to between 26,000*l.* and 27,000*l.* a-year. The chief town, which lies at the confluence of the Hase and Ems, and 10 or 11 miles north of Lingen, in the bailiwick of Osnaburg, bears the same name as the duchy; it has a gymnasium or grammar-school, soap and suetory manufactories, two churches, a hospital, bleaching-grounds, and some external trade. Its population is 2300: 52° 41' N. lat., 7° 17' E. long. Haseline, on the Hase, is the seat of the ducal court of justice, and manufactures agricultural implements; it has a convent, and about 1700 inhabitants.

The earldom of Recklinghausen, which constitutes the remaining portion of the duchy of Aremberg, so far as respects Germany, belonged to the electorate of Cologne until the year 1803, formed part of the grand-duchy of Berg in 1811, and was transferred to the Prussian crown in 1815. It is situated in the circle of Münster, in the Prussian province of Westphalia, and is bounded on the south by the circle of Arnsberg and Düsseldorf, and on the west by Cleves. Its superficial extent is 294 square miles, and the number of its inhabitants at the close of the year 1831 was 42,214. The face of the country is a plain, intersected with gentle eminences; the Lippe traverses it, and its western districts are watered by the Emster. The soil is strong and fertile; the people depend chiefly upon agriculture and the breeding of cattle, though they are also employed very generally in making yarn and linen. It produces iron, freestone, turf, and coals. The inhabitants are all of the Catholic faith, and divided into seventeen parishes. The revenue which the duke of Aremberg derives from it is computed at nearly 16,000*l.* Recklinghausen, the chief town, which lies at the foot of the Hard, the highest spot in the earldom, is about 50 miles N.E. of Cologne, on the Lippe. It has a ducal residence, two churches, an asylum for females of noble birth, some linen manufactories, and a steel-works; and, in 1831, had a population of 2466 souls; 51° 57' N. lat., 7° 12' E. long. The other towns of note in this earldom are Dorsten, population 2295; and Boer, which, with its dependencies, contains above 4000 inhabitants. The latter

includes the iron-works of St. Antonie, which are among the most considerable in Westphalia, and have sometimes produced 600 tons per annum.

ARENARIUS, literally, *relating to the sands*, a work of Archimedes. [See ARCHIMEDUS.]

ARENG is the botanical name of one of the palms that produce sago, and from which palm-wine is obtained. The only species, *Areng saccharifera*, is described as a plant of an ugly appearance, having a trunk twenty or thirty feet high, covered almost entirely with coarse black fibres, resembling horse-hair. The leaves are from fifteen to twenty

[*Areng saccharifera*.]

five feet long, and pinnated; their leaflets, which are from three to five feet long, widen gradually to the point, where they are ragged and prickly, in consequence of the projection of their hard veins beyond the margin; above they are of a deep shining green, but on their under surface they are firmly coated with ash-coloured mealy matter. The stalks of these leaves have intermixed with their coarse hair stiff bristles as thick as porcupine's quills. Each bunch of flowers is from six to ten feet long, and, when covered with fruit, is as much as a man can carry. The berries are of a yellowish brown colour, about the size of a medlar, and extremely acid; each contains three seeds.

This palm is found in all the islands of the Indian Archipelago, in moist and shady ravines through which rivelets find a course: it is much used for the sake of its sap, which flows in great abundance from the wounded branches of the inflorescence about the time when the fruit is forming. A bamboo bottle is tied to the extremity of an amputated branch, and removed twice a day, morning and evening. A single tree will yield a large quantity of this fluid, which, when first drawn from the tree, is transparent, with the taste and colour of new wine: after a short time it becomes turbid and milky, and acquires a slight degree of acidity. When fit for drinking it is of a yellowish colour, with a powerful odour and a good deal of astringency; strangers do not, for some time, become accustomed to it. It is exceedingly intoxicating; but, if drunk in moderation, is said to be stomachic and wholesome.

Besides yielding wine, the coarse fibres of the stem and leaf-stalks are manufactured into powerful cables, and the trunk contains a great quantity of a nutritious meal like sago; Dr. Roxburgh mentions that 150 lbs. of that substance were obtained from one tree felled in the botanic garden at Calcutta. (See Roxburgh's *Flora Indica*, vol. iii. p. 627; and Rumphius' *Herbarium Amboinense*, vol. i. The former calls this palm *Saguerus Rumphii*.)

ARENSBURG, the capital of a circle in the large island of Oesel, or, as the natives call it, *Kure-Saar* or *Saars-Ma*, at the entrance of the Gulf of Riga, and within the limits of the Russian government of Livonia, is situated in about

51° 24' N. lat., and 8° 1' E. long. It lies on the Pëddus, a small river on the S.E. side of the island, and has a harbour, too shallow for loaded-vessels of any size, which are therefore compelled to anchor about five miles below the town. Its present site was formerly the abode of a colony of pagans from Esthonia. Valdemar, the Danish sovereign, built a fort of wood on the spot in 1205, but this fort having been destroyed by fire, another was rebuilt in 1221, at the time when Arensburg was erected into the seat of a bishopric; and it was converted into a regular and strongly-fortified castle by Hermann, bishop of Osnaburg, in 1334. Charles XII. afterwards added greatly to its strength and embellishment; but part of the works were destroyed in the course of the operations which preceded its capture by the Russians in September, 1710. It is a fine specimen of solid masonry, and constructed in a style of magnificence which reflects credit on the memory of its founder, and the talent of the age in which he lived. The town itself contains a Russian and a Lutheran church, a town-hall, public school, and hospital, and about 1400 inhabitants, nearly the whole of whom are Germans. They load twenty vessels a year with the produce of their industry and fisheries. Two fairs are annually held in the town.

AREO'PAGUS, or more correctly AREIOPAGUS, the Hill of Ares, is an eminence at a short distance west of the Athenian Acropolis. It was here that Xerxes posted his troops for the attack of that fortress (Herod. viii. 52). The circumstances which connected the place with the God are variously told. It was the hill of Ares, according to some, because the Amazons, who in their invasion of Attica pitched their camp on it, were descendants of Ares, or rather, according to Æschylus (*Eumen.* v. 692, ed. Stan.), because they performed sacrifice to the God in that place; according to others, because Ares himself was there tried for adultery; or lastly, to follow the more popular story (Paus. i. 2, 8), because it was on this hill that the God was brought to trial by Poseidon (Neptune) for the murder of his son Halirrothius. In short, the place was called Areopagus, and, in process of time, these legends were invented or employed to supply the want of further information.

AREOPAGUS, COUNCIL OF, a celebrated council, so called from the hill of that name, on which its sessions were held. It was also called the council above (*ἡ ἄνω βουλή*), to distinguish it from the council of five hundred, whose place of meeting was in a lower part of the city, known by the name of the Ceramicus (Paus. i. 3, 4). Its high antiquity may be inferred from the well-known legends respecting the causes brought before it in the mythical age of Greece, among which that of Orestes, who was tried for the murder of his mother, has obtained especial celebrity (*Æschyl. Eumen.*); but its authentic history commences with the age of Solon. There is, indeed, as early as the first Messenian war, something like historical notice of its great fame, in the shape of a tradition preserved by Pausanias (iv. 51), that the Messenians were willing to commit the decision of a dispute between them and the Lacedæmonians, involving a case of murder, to this council of Areopagus. We are told that it was not mentioned by name in the laws of Dracon, though its existence in his time, as a court of justice, can be distinctly proved (Plut. *Vit. Sol.* c. 19). It seems that the name of the Areopagites was lost in that of the Ephetæ, who were then the appointed judges of all cases of homicide, as well in the court of Areopagus, as in the other criminal courts. (See Müller, *History of the Dorians*, vol. i. p. 352, English translation.) Solon, however, so completely reformed its constitution, that he received from many, or, as Plutarch says, from most authors, the title of its founder. It is, therefore, of the council of Areopagus, as constituted by Solon, that we shall first speak; and the subject possesses some interest from the light which it throws on the views and character of Solon as a legislator. It was composed of the archons of the year (see ARCHON), and of those who had borne the office of archon. The latter became members for life; but before their admission, they were subjected, at the expiration of their annual magistracy, to a rigid scrutiny (*dokimasia*) into their conduct in office, and their morals in private life. Proof of criminal or unbecoming conduct was sufficient to exclude them in the first instance, and to expel them after admission. Various accounts are given of the number to which the Areopagites were limited. If there was any fixed number, it is plain that admission to the council was not a necessary consequence of honourable discharge from the

dokimasia. But it is more probable that the accounts which limit the number are applicable only to an earlier period of its existence. (See the anonymous argument to the oration of Demosthenes against Androtion.) It may be proper to observe, that modern histories of this council do not commonly give the actual archons a seat in it. They are, however, placed there by Lysias the orator (*Areop.* p. 110, 16-20), and there is no reason to think that in this respect any change had been made in its constitution after the time of Solon. To the council thus constituted Solon entrusted a mixed jurisdiction and authority of great extent, judicial, political, and censorial. As a court of justice, it had direct cognizance of the more serious crimes, such as murder and arson. It exercised a certain control over the ordinary courts, and was the guardian generally of the laws and religion. It interfered, at least on some occasions, with the immediate administration of the government, and at all times inspected the conduct of the public functionaries. But, in the exercise of its duties as public censor for the preservation of order and decency, it was armed with inquisitorial powers to an almost unlimited extent.

It should be observed, that in the time of Solon, and by his regulations, the archons were chosen from the highest of the four classes into which he had divided the citizens. Of the archons so chosen, the council of Areopagus was formed. Here, then, was a permanent body, which possessed a great and general control over the state, composed necessarily of men of the highest rank, and doubtless in considerable proportion of eupatridæ, or nobles by blood. The strength of the democracy lay in the *ecclesia* or popular assembly, and in the ordinary courts of justice, of which the *dikasts*, or jurors, were taken indiscriminately from the general body of the citizens; and the council of Areopagus exercised authority directly or indirectly over both. The tendency of this institution to be a check on the popular part of that mixed government given by Solon to the Athenians, is noticed by Aristotle (*Polit.* ii. 9, and v. 3, ed. Schneid.) He speaks, indeed, of the council as being one of those institutions which Solon found and suffered to remain; but he can hardly mean to deny what all authority proves, that in the shape in which it existed from the time of the legislator, it was his institution.

The council, from its restoration by Solon to the time of Pericles, seems to have remained untouched by any direct interference with its constitution. But during that interval two important changes were introduced in the general constitution of the state, which must have had some influence on the composition of the council, though we may not be able to trace their effects. The election of the chief magistrates by suffrage was exchanged for appointment by lot, and the highest offices of state were thrown open to the whole body of the people (see ARCHON). But about the year B.C. 459, Pericles attacked the council itself, which never recovered from the blow which he inflicted upon it. All ancient authors agree in saying that a man called Ephialtes was his instrument in proposing the law by which his purpose was effected, but unfortunately we have no detailed account of his proceedings. Aristotle and Diodorus state generally that he abridged the authority of the council, and broke its power (Aristot. *Polit.* ii. 9; Diodor. Sic. xi. 77). Plutarch, who has told us more than others (*Vit. Cim.* c. 15; *Vit. Pericl.* c. 7), says only that he removed from its cognizance the greater part of those causes which had previously come before it in its judicial character, and that, by transferring the control over the ordinary courts of law immediately to the people, he subjected the state to an unmixed democracy. Little more than this can now be told, save from conjecture, in which modern compilers have rather liberally indulged. Among the causes withdrawn from its cognizance, those of murder (*φονικὰ δίκαια*) were not included; for Demosthenes has assured us (*Contr. Aristocr.* p. 641-2), that none of the many revolutions which had occurred before his day had ventured to touch this part of its criminal jurisdiction. There is no reason to believe that it ever possessed, in matters of religion, such extensive authority as some have attributed to it, and there is at least no evidence that it lost at this time any portion of that which it had previously exercised. Lysias observes (*Areop.* p. 110, 46), that it was in his time changed especially with the preservation of the sacred olive-trees; and we are told elsewhere that it was the scourge of impiety. It possessed, also, long after the time of Pericles, in some measure at

least, the powers of the censorship. (Athenæus 4, 64, ed. Dindorf.)

Pericles was struggling for power by the favour of the people, and it was his policy to relieve the democracy from the pressure of an adverse influence. By increasing the business of the popular courts, he at once conciliated his friends, and strengthened their hands. The council possessed originally some authority in matters of finance, and the appropriation of the revenue; though Mr. Mitford and others, in saying that it controlled all issues from the public treasury, say perhaps more than they can prove. In later times, the popular assembly reserved the full control of the revenue exclusively to itself, and the administration of it was committed to the popular council, the senate of five hundred. It seems that, at first, the Areopagites were invested with an irresponsible authority. Afterwards they were obliged, with all other public functionaries, to render an account of their administration to the people (*Æsch. Contr. Ctes.* p. 56, 30). Both these changes may, with some probability, be attributed to Pericles. After all, the council was allowed to retain a large portion of its former dignity and very extensive powers. The change operated by Pericles seems to have consisted principally in this: that, from having exercised independent and paramount authority, it was made subordinate to the *ecclesia*. The power which it continued to possess was delegated by the people, but it was bestowed in ample measure. Whatever may have been the effect of this change on the fortunes of the republic, it is probable that too much importance has been commonly attached to the agency of Pericles. He seems only to have accelerated what the irresistible course of things must soon have accomplished. It may be true that the unsteady course of the popular assembly required some check, which the democracy in its unmitigated form could not supply, but the existence of an independent body in the state, such as the council of Areopagus as constituted by Solon, seems hardly to be consistent with the secure enjoyment of popular rights and public liberty; which the Athenian people, by their naval services in the Persian war, and the consequences of their success, had earned the right to possess, and the power to obtain. It ought not, however, to be concluded, that institutions unsuitable to an altered state of things were unskillfully framed by Solon, or that he surrounded the infancy of a free constitution with more restrictions than were necessary for its security. He may still deserve the reputation which he has gained of having laid the foundation of popular government at Athens.

With respect to the censorship, we can show, by a few instances of the mode in which it acted, that it could have been effectually operative only in a state of society from which the Athenians were fast emerging before the time of Pericles. The Areopagites paid domiciliary visits, for the purpose of checking extravagant housekeeping (Athenæus 6, 46). They called on any citizen at their discretion to account for the employment of his time (Plut. *Vit. Sol.* c. 23). They summoned before their awful tribunal a little boy for the offence of poking out the eyes of a quail (Quintil. 5, 9, 13). They fixed a mark of disgrace on a man who had dined in a tavern (Athenæus 13, 21). Athens, in the prosperity which she enjoyed during the last fifty years before the Peloponnesian war, might have tolerated the existence, but certainly not the general activity, of such an inquisition.

It appears from the language of contemporary writers, that, while there were any remains of public spirit and virtue in Athens, the council was regarded with respect, appealed to with deference, and employed on the most important occasions (Lys. *Contr. Theomnest.*, p. 117, 12; *De Evandr.*, p. 176, 17; *Andoc.*, p. 11, 32; *Dem. Contr. Aristocr.*, p. 641-2). In the time of Isocrates, when the dokimasia had ceased, or become a dead letter, and profligacy of life was no bar to admission into the council, its moral influence was still such as to be an effectual restraint on the conduct of its own members (Isocr. *Areop.*, p. 147). In the corruption of manners and utter degradation of character which prevailed at Athens, after it fell under the domination of Macedonia, we are not surprised to find that the council partook of the character of the times, and that an Areopagite might be a mark for the finger of scorn (Athenæus 4, 64). Under the Romans it retained at least some formal authority, and Cicero applied for and obtained a decree of the council, requesting Cratippus, the philosopher, to sojourn at Athens, and instruct the youth (Plut. *Vit.*

Cic., c. 24). It long after remained in existence, somewhat superior in dignity, and perhaps equal in power, to a modern court of aldermen in a municipal corporation. The old qualifications for admission were neglected in the days of its degeneracy, nor is it easy to say what were substituted for them. Later times saw even a stranger to Athens among the Areopagites.

We shall conclude this article with a few words on the forms observed by the council in its proceedings as a court of justice in criminal cases. The court was held in an uninclosed space on the Areopagus, and in the open air; which custom, indeed, it had in common with all other courts in cases of murder, if we may trust the oration (*De Cæde Herodis*, p. 130) attributed to Antiphon. The Areopagites were in later times, according to Vitruvius, accommodated with the shelter of a roof. The prosecutor and defendant stood on two separate rude blocks of stone (Paus. i. 28), and, before the pleadings commenced, were required each to take an oath with circumstances of peculiar solemnity; the former, that he charged the accused party justly; the defendant, that he was innocent of the charge. At a certain stage of the proceedings, the latter was allowed to withdraw his plea, with the penalty of banishment from his country (Dem. *Contr. Aristocr.*, p. 642-3). In their speeches both parties were restricted to a simple statement, and dry argument on the merits of the case, to the exclusion of all irrelevant matter, and of those various contrivances known under the general name of *paraskeue* (*παράσκευη*), to affect the passions of the judges, so shamelessly allowed and practised in the other courts (Or. *Lycurg.*, p. 149, 12-25; Lucian. *Gymn.*, c. 19). Of the existence of the rule in question in this court, we have a remarkable proof in an apology of Lysias for an artful violation of it in his Areopagitic oration (p. 112, 5). Advocates were allowed, at least in later times, to both parties. Many commentators on the New Testament have placed St. Paul as a defendant at the bar of the Areopagus, on the strength of a passage in the Acts of the Apostles (xvii. 19). The apostle was indeed taken by the inquisitive Athenians to the hill, and there required to expound and defend his new doctrines for the entertainment of his auditors; but, in the narrative of Luke, there is no hint of an arraignment and trial.

Some of our readers may perhaps be surprised that we have made no mention of a practice so often quoted as peculiar to the Areopagites, that of holding their sessions in the darkness of night. The truth is, that we are not persuaded of the fact. It is, indeed, noticed more than once by Lucian, and perhaps by some other of the later writers; but it is not supported, we believe, by any sufficient authority, whilst there is strong presumptive evidence against the common opinion. It was, as it should seem, no unusual pastime with the Athenians to attend the trials on the Areopagus as spectators (Lys. *Contr. Theomn.*, p. 117, 10). We suspect that few of this light-hearted people would have gone at an unseasonable hour in the dark to hear such speeches as were there delivered, and see nothing. Perhaps there may be no better foundation for the story, than there is for the notion, till lately so generally entertained, that the same gloomy custom was in favour with the celebrated Vehmlic tribunal of Westphalia.

AREQUIPA, a department of the republic of Peru, bordered to the north by that of Lima. It is 185 leagues long, and 30 wide; the temperature is mild, and the soil fertile; the aspect of the country is that of a perpetual spring. It is watered by the Lona, the Arequipa, the Tambo, and the Chile, and has a considerable commerce in wine with the adjacent provinces; cochineal is also produced, and there are gold and silver mines, particularly those of Calloma. It has excellent pastures for vast herds of cattle, and produces wheat, maize, and sugar. It is backed by the Andes, offsets from which come down to the sea coast, and form a succession of delightful valleys.

AREQUIPA, one of the largest and finest cities of Peru, second only to Lima, is situated in the beautiful valley of Quilca, about thirty-five miles from the coast. It was originally founded by Francisco Pizarro in 1539, but not on its present site; its inland situation having secured it from the attacks of pirates who infested the coast, it has continued in a flourishing condition, though repeatedly desolated by earthquakes. The inhabitants have acted altogether on a different system from the people in most other parts of this country, who build slightly, that there may be the less danger in the overthrow of their edifices, and less ex-

pense in restoring them. On the other hand, the houses of Arequipa are built of stone, very substantial, low, and vaulted, with the view of their being able to withstand the shock. The town is populous, the inhabitants being estimated at 40,000; it is a bishop's see, with a cathedral, under the archbishopric of Lima, is divided into three parishes, has two Franciscan convents, one Dominican, and one Augustine, a college of Jesuits, and a hospital of S. Juan de Dios. A handsome bridge is thrown over the Chile, which runs through the city, and, being let off in sluices, irrigates the country; it is also conducted through the streets by canals, which contribute to cleanliness, and to the health of the inhabitants. An elegant bronze fountain adorns the Plaza, or great square. The climate is delightful; in winter a slight frost is perceptible, and the summer heats are not excessive. Gold and silver, cloths, woollens, and cottons, are manufactured at Arequipa, which carries on a great trade with Buenos Ayres, exporting brandies, wines, flour, cotton, and sugar; and importing cattle, dried flesh, tallow, cocoa, &c. The great commercial road passes through the city from Lima to the southern provinces. (Ulloa).

Mollendo, the port of Arequipa, consists of about fifty huts built of reed-mats, and covered with flat cane roofs, without windows and chimneys. The whole has the appearance of a wicker-work cage. The anchorage is open, but, like other ports on the coast, is safe, from the general absence of storms. The site of this village was chosen for the advantage of a sandy beach to land on in the balsa. (Hall.)

ARES (*Ἄρης*), the God of War among the Greeks, generally considered as corresponding to the Roman Mars. Homer makes him a native of Thrace, and others consider him the father of several Thracian rivers and races. It is therefore highly probable that he was the god particularly worshipped by some northern people, though nearly all other traces of this circumstance have disappeared. The Scythian deity known to Herodotus as the God of War, whom he calls by the Greek term *Ares* (iv. 62), was worshipped under the form of an iron scimitar, to which horses and other quadrupeds were annually offered; and also every hundredth man of captives taken in war. In the later genealogy of the gods he was considered the son of Jupiter and Juno, and, as such, took part in the war against the giants, and slew Mimas and Pelorus. In the contest with Typhon he fled with the other gods into Egypt, and was changed into a fish. He was not more successful in his engagement with Otus and Ephialtes, the children of Aloüs, by whom he was imprisoned for thirteen months. To a still later period we must refer the murder of Halirrhothius, and his trial before the court of Areopagus, as well as his combat with Hercules.

It is a curious circumstance that the Greeks, though constantly engaged in war, should have paid little attention to the worship of Ares. There were few temples erected to his honour in Greece. Geronthræ, a village of Laconia, had a temple and grove where a yearly festival was celebrated, to which no female was admitted (Paus. iii. 22): there was another on the road from Amyclæ to Therapne in Laconia (iii. 19), and a third at Athens (i. 8). Though, as we have remarked, Ares seems to be a Thracian god, yet the element of the word Ares is an integral part of the Greek language, and the word which denoted best and bravest, *aristos* (*ἀριστος*), is the superlative of *ares*. The Sanscrit *ari*, nom. *aris*, signifies an enemy. In early times human sacrifices were offered to him by the Lacedæmonians, dogs by the Carians, and asses by the Scythians (Apollod. *Fragm.* p. 394, ed. Heyne).

It is difficult to say what distinctive character ancient artists wished to give to this god, because no Greek state honoured him as their principal deity. We have no distinct account of his statues by Alcámenes and Scopas in the temple at Athens, but we can collect, from some that have been preserved, and also from heads of the god on gems, that the following is the general character under which he is represented. The expression is stern and thoughtful; firm nervous muscles, a strong fleshy neck, and short bristly hair; the mouth is small, the lips full, and the eyes deep-set. It is only in later times that he appears with a strong beard as the Roman Marspiter. When not naked, his dress is a chlamys (*σαγυμ*). See a beautiful head on a gem (Millin, P. Gr. 20); a standing figure on a basso-relievo (Pio Clem. iv. 7); head on the coins of the Mamertini (Magnani, iv. 31, 32); on the Denarii of Fonteius Capito

(Patin, p. 114). See this subject fully treated by Hirt, *Bildende Kunst*, 1833; Müller, *Archæologie der Kunst*, p. 492. (For the Italian God of War, see MARS.)

ARETÆUS, surnamed **CAPPADOX**, or the **CAPPADOCIAN**, one of the most valuable medical writers of antiquity, is supposed to have lived in the latter part of the first and the beginning of the second century after Christ. There are no positive accounts as to the time and circumstances of his life: the above supposition, therefore, rests solely on the fact of the medicinal preparations of Andromachus, physician to the Emperor Nero, and the medical dignity of the Archiatri, being mentioned in his works; whilst, on the other hand, the name of Aretæus occurs in the *Euporista* of Dioscorides, which appears to have been written during the reign of Vespasian. Hence it is concluded, that Aretæus wrote shortly after the time of Nero. He takes notice of the wine of Falernum, and other Italian wines, which has led critics to believe that his residence must have been in Italy. The learned have found some difficulty in fixing upon the sect, or school of medicine, to which Aretæus belonged. P. Petit considered him as a follower of the dogmatic sect, who founded their explanations of life and disease on the four elementary qualities. But his frequent allusions to the *pneuma*, or spirit, have led others to regard him as one of the pneumatic school founded by Athenæus, which embraced a considerable proportion of the medical men of eminence at the period when Aretæus is supposed to have lived. It seems to be a peculiar merit of this physician, however, to have remained free from the predominant influence of any one of the prevailing theoretical schools, and to have preserved a praiseworthy independence in the observation and treatment of diseases. Aretæus was an original observer; his writings bear no traces of compilation; and if a part of the information which he affords belongs to the age in which he lived, there is another very considerable part for which we seem to be indebted to his own personal experience.

Aretæus regarded a knowledge of the structure and functions of the body as a necessary step towards the study of disease; his anatomical remarks, however, betray sufficiently the imperfect state of this science in his time. He concurred with the pneumatic physicians and the Stoic philosophers, in believing the heart to be 'the principle of life and strength,' and the seat of the soul. He gave a full account of the distribution of the *vena portarum*, and regarded all veins as having their origin in the liver; he also was aware of the numerous communications which exist in various parts of the venous system, which led him to refute the notion that particular veins in the arm are connected with particular internal organs, and the consequences which were drawn from this notion as to bloodletting. Aretæus looked upon the liver as the organ destined to prepare the blood, and the spleen as fitted to purify that fluid. He regarded both the stomach and colon as organs of digestion, and bestowed much attention on the morbid affections of the latter organ. He knew that the kidneys had a glandular structure. He stated the nerves to be the organs of sensation and motion. The fact that injuries of the head are apt to produce paralytic affections on the opposite side did not escape his observation, and, in order to account for it, he stated that the nervous fibres in the brain form a decussation in the shape of the Greek letter X, whilst the nerves arising from the spinal marrow proceed directly to the organ for which they are designed. Notwithstanding these curious remarks on the functions of the nervous system, Aretæus evidently did not make any clear distinction between the nervous and tendinous parts; the latter are undoubtedly alluded to, when he says that, besides the nerves proceeding from the brain, there are others which pass from one bone to another, and are the principal sources of motion.

The descriptions which Aretæus has given of the diseases to which the human economy is subject are accurate delineations, evidently taken from nature, and distinguished by a peculiar liveliness, elegance, and conciseness of diction. He is thought to have excelled all antient authors, not even excepting Hippocrates, in the art of describing diseases, and may still be regarded as a model in this species of literature. His account of epilepsy, tetanus, acute and chronic headaches, hæmoptysis and *causus*, or burning fever, are peculiarly happy specimens of his manner of writing.

In the treatment of diseases, Aretæus regarded experience as the best guide (*ἀγαθὴ διδάσκαλος ἢ πείρη*), and he

repeatedly refers to the necessity of following the hints which nature gives to the physician. His methods of treatment seem to have been energetic where it appeared necessary, but always simple; and he was averse to that farrago of medicines to the use of which some of his contemporaries were addicted.

He frequently employed emetics, purgatives, and clysters; and he was aware that emetics not only evacuate the contents of the stomach and intestines, but derive a great part of their efficacy from the shock which the act of vomiting produces in those parts. He was fond of bloodletting in chronic as well as acute diseases, but cautious with regard to the quantity of blood which he took away: he advises the blood to be stopped before fainting supervenes, and recommends not to take away too much blood at one bleeding in apoplexy. He also mentions the practice of opening a vein on the back of the hand, and he practised the operation of arteriotomy. He employed cupping-glasses and leeches, and he is the first author who mentions blistering with cantharides: as he recommends this practice as preferable to other rubefacients, without mentioning it as having been formerly in use, it appears probable that we are indebted to him for this most important remedy; nor had the tendency which it sometimes has to injure the functions of the urinary organs escaped his observation; he enjoins, therefore, milk to be drank in large quantities before the blister is applied.

Scarcely any internal medicines were employed by Aretæus in the treatment of acute diseases; but he paid strict attention to diet and regimen: among his dietetical prescriptions, those on the use of the different kinds of milk deserve to be mentioned. In treating chronic diseases he more frequently had recourse to the aid of medicines; we find him prescribing diuretics, sudorifics, and several of the compound stimulating preparations which were in vogue in his time. One of the substances he most frequently resorted to is castoreum, which he regarded as very efficacious in various affections of the nervous system.

Of the writings of Aretæus, only four books on the causes and symptoms, and as many on the treatment, of acute and chronic diseases are extant; nor have they been preserved in a perfect form: chap. i.—iv. and part of chap. v. of the first book on the causes, and several passages in the books on the treatment, of diseases are lost. In this work the author alludes to his treatises on surgery, on pharmacy, on fevers, and on the diseases of women, of all which works not a single fragment now remains. Had they been handed down to our times, they would have formed most important additions to medical literature. Aretæus wrote in the Ionic dialect of the Greek language, which at his period had nearly ceased to be employed in writing; but he was, probably, induced to adopt it by the example of the older medical authors, Hippocrates and his contemporaries and successors, who wrote in this dialect, which was also used in the antient sentences of the school of Cos.

The eight books of Aretæus were first edited from the Parisian MSS. by J. Goupyl, and published at Paris, 1554, 8vo. The standard edition is that of Mr. John Wigan, student of Christ Church, Oxford: it was undertaken by the advice and with the assistance of Dr. Freind, and printed at the Clarendon Press, 1723, folio. Wigan gave a very good Latin translation, notes, and a valuable dissertation *de Aretæi ætate, secta, in rebus anatomicis scientia, et curandi ratione*. This edition is scarce, only 300 copies having been struck off. Another edition was published under the superintendence of Boerhaave, Leid. 1731, folio, the greater part of it had been printed as early as 1719, before the publication of the Oxford edition; and the text, as well as the Latin translation, are such as they had been before Wigan's labours. Boerhaave added, however, the valuable critical commentaries of Peter Petit, a Parisian physician, which had remained in MS. for nearly seventy years. Aretæus also forms the 24th volume of Kühn's edition of the Greek medical authors. This volume (Lips. 1828, 8vo.) contains the Greek text and Latin translation, Wigan's preface, notes, and dissertation, Boerhaave's preface, Petit's commentaries, Triller's conjectures and emendations, and a copious Greek index by Michael Mattaire. An English translation of Aretæus, by John Moffat, was published at London, 1785, 8vo.

ARETHU'SA, a celebrated fountain in the island Ortygia, one of the five divisions of antient and the site of modern Syracuse. For the story of the nymph Arethusa,

the manner of her change into a fountain, and the pursuit of her by the river-god Alpheus from Eleia below the sea to Sicily, see ALPHEIUS, and Ovid, *Mét.* v. 572. Pausanias tells rather a different story; he says that Arethusa passed over into Orygia, and there was changed into a fountain (v. 7). Diodorus says, that the nymphs produced the fountain Arethusa to gratify Diana, after one of whose names the island was called Orygia, and to whom it was consecrated. He calls it 'a very large fountain,' and adds, that it abounded in large fish, which were held sacred, and never caught; and that if any persons were impious enough to eat them (as had been done in time of siege), they incurred the anger of the deity and fell into great misfortunes (v. 3). Cicero speaks of it as a 'fountain of sweet water of incredible size and abounding in fish, which would be covered by the sea but for a stone bulwark.' (*Verr. Act.* ii. iv. 53.) That beauty and abundance of water which attracted the admiration of the poets, has disappeared. Swinburne speaks of the rock as riven by earthquakes, and of the spring as sometimes failing in the volcanic convulsions which from time to time desolate that region. Wilkins thus describes its appearance at the beginning of this century: 'The fountain now springs from the earth under a natural arch in the rock, within a few paces of the sea, and is only separated from it by the city wall, through an aperture in which it is discharged into the harbour. It is a considerable spring of brackish water, although of little depth; and is resorted to by the poor female inhabitants of Syracuse, who, after the Sicilian manner of washing, perform the operation standing up to their knees in the stream. Over the arch is a rude image of the Madonna, which the Syracusans pretend to be a statue of the nymph Arethusa.' (*Magna Græcia*.)

It was commonly said that things thrown into the Alpheus would reappear in this fountain. Strabo asserts that a cup did so. Seneca quotes it as an article of popular belief, that when the Olympian festival was celebrated on the banks of the Alpheus, the sweepings of the temple reappeared in the Sicilian fountain. (*Nat. Quæst.* iii. 26.) Moschus intimates a similar belief in his seventh Idyll. In the middle ages the story reappeared with a change of form adapted to the change in religion, and the fountain was said to cast up leaves not known to grow except on the river Jordan. (Marifotti, *Cron. Antiche di Calabria*, ap. Wilkins.) A strong spring bubbles up under water near the place where the stream from the fountain runs into the sea; and this has been said to come from the waters of the Alpheus. It is now called *L'Occhio della Zilica*. The Syracusan poets, Theocritus and Moschus, make frequent mention of this favourite stream. There was another Arethusa in Samos, and another in Eubœa. (*Schol. in Theoc.* i. 117.)

ARETINO, PIETRO, an Italian writer of the sixteenth century. He was born at Arezzo in 1492, and was the natural son of Antonio Bacci, a patrician of that city. He left his native place very young, and went to Perugia, where he found employment as a bookbinder. Here he had an opportunity of reading the books which were entrusted to him, and of thus acquiring some information. His regular education had been very limited, and indeed he remained all his life ignorant of Latin and Greek; but he had much quickness of parts, a fervid imagination, and great fluency of expression. After some years he set off from Perugia on foot; and with nothing but the clothes he had on, went to Rome in quest of better fortune. He first met with a patron in a wealthy merchant, Agostino Chigi, the same for whom Raphael painted the palace called La Farnesina, who lodged him in his house. His next step was an introduction to Pope Leo X., and to Cardinal Giulio de' Medici, afterwards Clement VII., in whose service it appears that he remained seven years, but in what capacity is not known. A circumstance which strongly shows the profligacy of those times drove him away from Rome about 1524. The celebrated painter, Giulio Romano, sketched a series of most obscene drawings, Marco Antonio Raimondi engraved them, and Aretino illustrated them by sonnets. The court of Rome, being informed of this scandal, ordered the arrest of the offenders. Giulio Romano escaped to Mantua, Aretino also ran away, but Raimondi was seized, and would have been severely punished, had he not succeeded in escaping from prison. Aretino now found a friend in Giovanni de' Medici, the famous captain of the Florentine republic, and in Francis I. of France. Giovanni took a particular liking to him, and introduced him to the king, who made him presents in

return for the praises which Aretino lavished on him. The death of Giovanni de' Medici having deprived Aretino of a generous patron, he went to live at Venice, where he depended on his writings for subsistence. He wrote both prose and verse, obscene dialogues, satirical *capitoli in terza rima*, heroic cantos, sonnets, and comedies, besides a multitude of letters which he addressed to all the princes and great men and ladies of his time, sometimes flattering them, sometimes praising himself, and generally asking money or some other favour in exchange for his praise, or for the dedication of some of his works; and sometimes threatening them with the lash of his satire if his demands were not complied with. It is a curious fact, that by these means he received considerable sums of money, which enabled him to lead a dissolute life, and also to satisfy his taste for prodigality, which he mistook for generosity. His house was open indiscriminately to the destitute poor, the adventurer, and the profligate of either sex. He dressed in costly garments; and spent nearly a thousand scudi, or crowns, a year, a large sum in his time. He was often embarrassed, and ever craving for money, though he received presents from most Italian princes, as well as from Francis I., Charles V., Henry VIII. of England, and even, it is said, from Solymán, Sultan of the Turks.

Owing to the virulence both of his speech and pen, he narrowly escaped from several attempts to assassinate him. Twice at Rome, in the time of Leo X., he nearly lost his life, but was saved by a friend. Piero Strozzi, a celebrated captain of his time, who was serving in the French armies in Italy, being incensed at some satire of Aretino, sent him a message, that if he continued to slander him, he would have him killed in his bed; the threat so frightened the poet, that he shut himself up in his house, and would not trust any one within as long as Strozzi remained in the Venetian territory.

Aretino still cast a longing eye towards Rome, in expectation of dignities and emoluments. For this purpose he wrote several compositions on sacred subjects, such as the *Lives of Christ*, the *Virgin Mary*, *St. Catherine*, *Thomas Aquinas*, *A Commentary on the Book of Genesis*, and *A Paraphrase of the Seven Penitential Psalms*. These works met with no success, being, with the exception perhaps of the last, utterly contemptible both in their conception and style. The language of Aretino is generally turgid, affected, full of metaphors and hyperbole, resembling that which became prevalent in Italy a century later, and which is known by the name of *del seicento*. He wrote with great facility, but at the same time with carelessness, and his taste was coarse and trivial. The Duke of Urbino applied in his favour to Pope Paul III., and even proposed that Aretino should be made a cardinal. Luckily for the credit of the Roman hierarchy, the pope would not listen to such a suggestion; and it was perhaps in resentment of this, that Aretino unmercifully lashed the pope's grandson, Pier Luigi Farnese, Duke of Parma. After Paul's death, Julius III., who was a native of Arezzo, was addressed by Aretino in a letter of congratulation, accompanied by a sonnet characterized by the most fulsome praise of the new pontiff. Julius, being at the same time importuned by several persons around him in favour of Aretino, made the poet a present of 1000 scudi, and sent him the bull or diploma of Knight of St. Peter, an inferior order, to which a small income was attached. Aretino still expecting more, went to Rome with the Duke of Urbino in 1553, was kindly received by the pope, but meeting with no further encouragement, he again left that city in disappointment a few months after, and returned to Venice, where he remained till his death in 1557. He was buried in the church of S. Luca, at Venice, where a monument was raised to him, which Sansovino mentions in his *Venezia Illustrata*; it was afterwards removed in the reparations which that church underwent. The witty epitaph which has been reported by many biographers and travellers, and by Misson among the rest, was never placed on his tomb. Pietro Aretino must not be confounded with the historian Leonardo Bruni, also called 'L'Aretino'; nor with the poet Bernardo Accolti, who was styled 'L'Unico Aretino.' Some travellers, seeing the monument of Leonardo Bruni in the celebrated church of Santa Croce, at Florence, by the side of the tombs of Galileo, Michel Angelo, and Machiavelli, have mistaken it for that of Pietro, and have indulged in uncalled-for moral reflections on the subject. Pietro Aretino was never married, but he left several natural daughters. His works, and the most obnoxious of them in

particular, have been re-published separately at different times, notwithstanding the censure of the Inquisition, and have been translated into several languages. His *Capitoli* are the best specimens of his poetry: they are partly satirical and partly laudatory of several conspicuous characters of his age—Charles V., Catherine of Medici, Pope Julius, and the Duke of Urbino. He wrote *L'Orazia*, an historical tragedy in blank verse, one of the earliest Italian tragedies. His five comedies in prose,—*Il Filosofo*, *La Cortigiana*, *Il Mariscalco*, *L'Ipocrito*, and *La Talanta*,—are not without some merit in the invention, but, like most of the old Italian comedies, they are deficient in dramatic plot, and objectionable in their language. His *Letters* were published at Venice at different epochs during his lifetime, and form six volumes, octavo, besides two volumes of letters written to Aretino by his numerous correspondents. Amidst a multitude of unmeaning or egotistical phrases, much of the life and character of Aretino, as well as of the character of his times, may be gathered from these letters. He was either the flatterer or the enemy of almost every Italian writer of his age; and it was one that abounded in writers. He bestowed freely the epithet of 'divine' on Cardinal Bembo, Fracastoro, Giovio, Alamanni, Tolommei, Lollo, and even upon Molza and Dolce, and they in gratitude returned the compliment with interest. Ariosto has not disdained to call himself 'Il divin Pietro Aretino.' Berni, on the contrary, was never his friend, and wrote a most bitter invective against him. Franco, another poet, nearly as immoral as Aretino himself, bandied satire with him. Aretino directed his enmity chiefly against the prelates of Rome: Clemens VII., Cardinal Caraffa, afterwards Paul IV., and the estimable and learned Cardinal Sadoletto, were all the objects of his low and vulgar abuse. At last they paid so little attention to it at Rome, that it was considered rather an honour to be satirized by the cynic poet. Aretino boasted of his impudence, styling himself 'by divine grace a free man,' and 'the scourge of princes.' He is indeed one of those instances of successful shamelessness which occasionally appear to astonish the world, and make us wonder that such nuisances are so long endured. But the heaviest guilt of Aretino lies in his licentious writings. He was the most offensive writer of a most immoral age, an age abounding in impure works, which might rival in obscenity those of ancient Rome, and are only surpassed in infamy by some of the worst productions of the French erotic press of the eighteenth century. (Count Mazzuchelli's *Vita di Pietro Aretino*.)

ARETINUS (Musician). [See GUIDO.]

AREZZO, a very antient and still considerable town of Tuscany, thirty-four miles S.E. of Florence. The citadel of Arezzo is in 43° 27' 52" N. lat. and 11° 52' 35" E. long. Arretium was one of the wealthiest and most populous among the twelve cities of ancient Etruria, was repeatedly at war with Rome, and afterwards became its ally, and supplied money and arms towards Scipio's expedition to Africa about the end of the second Punic war. Its government was then partly popular and similar to that of Rome, having its senate, and its patricians and plebeians. Arretium, having joined the Marsi and other Italian nations in the social war against Rome, was devastated by Sylla, its inhabitants were dispersed, and a Roman colony was sent into the country. It is a matter of doubt whether the colony did settle at old Arretium, as we find in the Roman geographers two colonies mentioned, one about eight miles to the north of it, called Arretium Julium, and another the same distance to the south, called Arretium Fidens, both distinguished from Arretium Vetus, which last, however, survived them both, having been restored by the care and liberality of Mæcenæ, who was said to be descended from the old kings or rather nobles of that part of Etruria. The pottery of Arretium was in great repute. After the fall of Rome, Arretium, or Aritium, as it is sometimes called, was ravaged by the Goths under Totila, but was restored under Justinian. It then passed under the dominion of the Longobards, and afterwards of Charlemagne and his successors. The bishops of Arezzo were made feudal counts, and as such governed the town and its county or district, in the name of the Emperor and King of Italy. In the eleventh century, however, Arezzo, like most Italian cities, threw off its allegiance to the empire, and adopted a republican form of government. It was subsequently distracted by the factions of Guelphs and Guibelines. The Guibelines at last prevailed in the

time of Frederic II.; and having at their head the Bishop Guglielmo Ubertini, drove the Guelphs out of the city. They next made war against Florence, and were defeated at the battle of Campaldino, in 1289, when the bishop was killed. In the following century, another bishop, Guido Tarlati of Pietramala, also a Guibeline, became Lord of Arezzo. He was a warrior and a statesman. He enlarged and fortified the city, made roads, conquered several neighbouring towns, fought against Florence, and maintained himself in his see although deposed by the pope, from whom he took Citta di Castello, and other places. Under him Arezzo attained a high degree of power and splendour. He died in 1327, and his monument is in the cathedral of Arezzo. After his death there came fresh dissensions among the citizens, and new wars with the Florentines, until 1384, when the city was taken and plundered by Ingelram of Coucy, a famous Condottiere of the times, who sold Arezzo to the Florentines for 40,000 golden florins. After more than a century Arezzo revolted against Florence in 1502, was again taken, and treated with great severity. In 1529 it opened its gates to the army of Charles V., which was then besieging Florence. Arezzo was obliged, in 1531, to submit, as well as Florence, to the Medici, and has ever since made part of the duchy of Tuscany. But its inhabitants have always retained something of their former independent and warlike spirit. In 1799, they rose against the French who had occupied Tuscany: the following year, after the battle of Marengo, being attacked by a French division, they resolutely defended themselves; but the town being stormed on the 19th of October, 1800, a dreadful scene of violence and slaughter ensued.

Arezzo is situated on two hills, and in the middle of a fine plain, watered by the Arno and the Chiana, and surrounded by an amphitheatre of mountains. The citadel is on the summit of one of the hills. It lies on the high road from Florence to Perugia and Rome, and three miles from the left bank of the Arno. The walls of Arezzo are about three miles in circuit, and have four gates: the streets are tolerably wide and well paved. The only remains of antiquity are the ruins of an amphitheatre. The cathedral is a large Gothic building, besides which there are several other remarkable churches with fine paintings, and various handsome palaces belonging to the nobility. But the handsomest structure in Arezzo is that called *Le Logge*, by the side of the town-house on the principal square, which has a fine portico nearly 400 feet long. It contains a theatre and the custom-house. It was built by Vasari, who was a native of this place. Arezzo has produced many other distinguished men—the monk Guido, the first restorer of modern music; Guittone, one of the earliest writers in Italian; the celebrated Petrarch, who was born here, though of Florentine parents; the historian Leonardi Bruni, Pietro Aretino, Pope Julius III., the naturalist and physician Cesalpini, the learned Redi, &c. Arezzo has about 10,000 inhabitants, and its comunita, or territory, 17,000 more in 1825, according to Professor Giuli's *Statistica della Val di Chiana*. But Arezzo is also the chief town of one of the five compartimenti, or provinces, into which Tuscany is now divided, which includes the large district called Val di Chiana, once a marsh, but now drained, and the towns of Cortona, Montepulciano, and others. The territory of Arezzo is fertile in corn, oil, wine, and fruits. The celebrated wine called *Alleatico*, the finest in Tuscany, is made here. There are also manufactories of woollens and of pins. Arezzo is a bishop's see, which has an income of 3,000 scudi, or crowns, per annum.

ARGALI, in zoology, the name of a species of wild sheep (*Ovis ammon*) found on the mountains of Siberia and Kamtschatka. [See SHEEP.]

ARGAND LAMP, so called from the name of its inventor, who was a native of France. This lamp has been made of various forms, for the different purposes of reading and of diffusing general light. Fig. 1. exhibits the external appearance of the reading-lamp; A is the reservoir of oil, from which it descends gradually to the cistern B, and is thence conveyed through by the pipe C to the burner D, containing the wick, placed between two tubes and immersed in oil. The wick rises a little above the upper surface of D, at E; F is the glass-chimney, the lower part of which is enlarged, in order to increase the current of air upwards; the chimney rests in the gallery G, and is kept in its place by four wires, two of which are marked H, H. By turning the gallery G, the wick is either raised or low

Fig. 1.

Fig. 2.

The reservoir A terminates in a neck, which screws into the upper part of the oil cistern B; when it is unscrewed and

inverted, the oil is poured into the reservoir at the hole N; by moving the handle L, the short tube O is made to cover this hole and prevent the oil from running out, and the reservoir is then screwed into its place, and the handle depressed so as to uncover the hole and to allow the passage of the oil into the cistern B. Within the perpendicular tube P there is placed a smaller tube Q, and both are closed at bottom and open at the top; the space between these contains oil and the wick R, stretched over the short tube S, rising a little above the tubes at T. The outer surface of the tube Q has a spiral groove formed round it, and a tooth in the ring or gallery G entering this groove, when it is turned round, causes the tube and wick attached to it to ascend or descend, so as to regulate the flame. On account of the nature of the reservoir which contains the oil, a constant supply will be kept up at the level marked by the dotted line U, both in the cistern B and in the wick-tubes P and Q.

It has been mentioned that various forms are given to the Argand lamps. In those employed for the purpose of giving a general and diffused light, the reservoir of oil is circular, and surrounds the cistern and wick, and is nearly on a level with the latter; a ground-glass shade, which in the smaller lamps is frequently globular, and in larger ones rather flat, rests upon a groove.

The chemical Argand lamp is a very useful instrument, and is represented by fig. 3. 3.: a is the reservoir of oil; b the

opening at which the oil is poured into it; c is a short copper chimney; d is a pinion by which motion is given to the rack e, so as to raise or depress the wick; the apertures at f supply air; and the dish g, in which the lamp stands, serves to retain any oil which drops from the reservoir.

ARGEIL, a name sometimes applied by Homer to the whole body of Greeks assembled at Troy; it is derived, probably, from the inhabitants of Argos, who had even in those early times raised their city to considerable celebrity. Homer, indeed, employs the word Argos not only to designate the name of a town, but also the whole Peloponnesus: Agamemnon is styled the sovereign of all Argos and the islands. (See Strabo, viii. 369.) The capital of Agamemnon's kingdom of Argos, which certainly did not comprise all the Peloponnesus, was Mycenæ. Homer often qualifies it with some epithet, as Achaicum (*Iliad*, ix. 141), when Argos of the Peloponnesus is meant, and Pelasgicum when the Thessalian city or district of that name is intended. Strabo (viii. 372) tells us that in later times the word Argos in the Thessalian and Macedonian dialects signified a plain or field, and we may therefore perhaps consider it as having the same root with *ager* in the Latin language. What connexion this has with the several cities named Argos, the geographer does not think proper to inform us, though he may perhaps intend us to infer that they were so called from being situated in a plain. Pausanias (viii. 7) mentions a plain (called the πεδὶον ἀργὸν) close to the mountain Artemisium, but we doubt if this has any reference to the use of the word Argos, of which we are here speaking. The early inhabitants of the Peloponnesian Argos and of the district around it were, we have good reason to believe, Pelasgi. (Strabo, viii. 371; Eurip. *Orest.*, 931; Æschyl.

Suppl., 268.) The arrival of Danaüs from Egypt, according to tradition, caused their name to be changed to Danaï, a term that occurs in the *Iliad*, but the mass of the population no doubt still remained the same. Eighty years after the Trojan war, or B. C. 1104, the invasion of the Peloponnese by the Heraclidæ took place, and Argos, like most of the other cities of southern Greece, was obliged to submit to the Dorians. Still this was only a change of dynasty, and all the older Achæan inhabitants were not compelled to leave their country. From this time the names Argos and Argeiî los. their more extensive signification; but the city Argos itself continued an important place under this new race. [See ARGOLIS, ARGOS, and ΑΧΑΪΕ.]

ARGEMONE, the name of a small genus of the poppy tribe, of which three species are cultivated in this country as ornamental plants. They are all natives of Mexico, and are characterised by having six petals and three sepals, a very unusual number of parts in the natural order to which this genus belongs. Their leaves are prickly, and generally marked with whitish or pale bluish-green veins; the flowers are white or yellow. The commonest species is *A. Mexicana*, from the seeds of which the Mexicans obtain an oil very useful to painters; the handsomest is *A. grandiflora*, the flowers of which are pure white, and as much as three inches in diameter. They are all hardy, and will thrive in almost any soil or situation. Their seeds should be sown in a hot-bed, and the young plants treated as half-tender annuals.

ARGENS, MARQUIS D', JEAN BAPTISTE BOYER, a writer of the last century, more remarkable than illustrious for his opinions, adventures, and literary reputation, was born at Aix in Provence, on the 24th June 1704, and, as he says, was destined to the bar from his birth, because his father, who was Procurator-General of the parliament of Aix, had resolved if possible to keep that office in his family. But the ardour of youth, and a restless disposition, led the marquis to frustrate the prudent designs of his parent, and to choose a profession which he thought more conducive to a life of pleasure. He therefore, by force of importunity, obtained his father's consent, and was placed in the army. Pleasure became his principal pursuit, and a course of illicit amours occupied a great portion of his time for several years. At last, interest was made to get him into the suite of Monsieur Andresel, in an embassy to Constantinople, which gave him an opportunity of visiting Algiers, Tunis, Tripoli, and some other places, and also of making a short tour in the Black Sea. In these voyages he had some curious adventures in the pursuit of his favourite pleasure, and was more than once in danger of experiencing the severity of Turkish retribution. He did not, however, neglect the opportunity of making many useful observations, and as he always attached himself as much as possible to the best informed and most respectable persons of the embassy, he was introduced by them into the best society. The remarks which he made upon the manners and customs of the people he conversed with, and his sketches of the characters and qualifications of those who were employed in the embassy, evince considerable ability for so young a man. Upon his return to France, he took seriously to the study of the law; and so far qualified himself as to be able to plead two remarkable causes, both of which he gained. Flattered by this success, and complimented upon the progress he had made and the fair prospect of future eminence thus opened to him, he began to think better of the bar. But, unfortunately relapsing into his former habits, his disgust for all professional studies returned. His intrigues becoming troublesome, and the state of his finances more so, he left home, and found his way to Paris, where accidentally gaining a sum of money in his first and only adventure at a public gaming-table, he had the good sense to keep it and retire to Rome, to study music, for which he had great taste, and to perfect himself in the art of painting, in which he became very skilful. The same propensities that drove him from home compelled him to return, by exhausting his funds, and subjecting him to the danger of assassination. On his return to Aix, where he was received with more kindness than he had a right to expect, he again applied to the law, but only for the purpose of employing himself till he could find some other occupation more suitable to his inclinations. An event soon occurred that he contrived to turn to his own purposes. This was the famous trial of the Jesuit Girard before the Parliament of Aix, for seducing Mademoiselle La Cadière, his penitent. The decision of this case was un-

satisfactory to the people of Aix and its neighbourhood: a riot ensued, and the military were called in to protect the magistrates. The marquis made this a pretext for again quitting the legal profession, his dislike for which seems to have been confirmed by a consideration of its being so often involved in religious disputes in Roman Catholic countries.

He went to Paris, obtained a commission, and was slightly wounded at the siege of Philipsbourg. At the siege of Kehl he received an injury by the fall of his horse, which rendered him incapable of further service, and he quitted the army without having distinguished himself as a military man.

In the meantime he had been guilty of his usual imprudences, and his father, thinking him incorrigible, disinherited him, and reduced his pecuniary allowance to half its former amount. Being in some measure compelled by this circumstance to abandon the fashionable world, he retired to Holland, where he lived under an assumed name, and endeavoured to obtain a livelihood by his pen, which he could there use with more freedom than in his native country. His *Lettres Juives* attracted the attention of Frederic the Great, then Prince Royal of Prussia, who commenced a correspondence with him, offered him his friendship, and invited him to Berlin, 'to live and philosophize with him.' The marquis declined this invitation, for good reasons: the king, Frederic William, was not partial to literary men; he had interfered with Frederic's studies, and had hanged one of his best friends before his face.

When Frederic came to the throne, in 1740, the invitation was renewed, and accepted. The marquis was now appointed one of his chamberlains, with a pension of 6000 francs; made a member of the Royal Academy of Belles Lettres, and Director of the Philological Class, with a salary of 800 francs, and other marks of royal favour. He had apartments in the palace, and the king built and furnished a country retreat for him. D'Argens was so disinterested as to refuse an addition to his emoluments, telling his majesty that he had many officers who had served him faithfully in his wars, who stood in greater need of his bounty.

There is evidence that his good sense influenced the king's conduct on some important occasions, which also show the extent of the confidence placed in him. His amours ended in a marriage with Mademoiselle Cochois, a dancer. When it took place is not known. His biographers choose to call it a sexagenarian adventure, but it is certain that this lady accompanied him to France in 1747. In the latter part of the marquis's life, his health and spirit appear to have failed together; he became unwilling to exert himself, and was too often absent from the supper parties under pretence of illness. He felt it was time to retire, and had reasons for wishing to end his days among his own relations. His brother, who had become president of the parliament of Aix, had honourably given him up a family estate, and built a house upon it for his reception. An agreement existed between D'Argens and the king that he should be allowed to retire when he had completed his sixtieth year, and he demanded the fulfilment of the bargain. It was, however, with great difficulty that he obtained only a leave of absence for six months, in 1759, under a solemn promise to return; this he meant to keep, and, though in bad health, he began his journey to Berlin, and reached Bourg en Bresse, where he was detained by a long and serious illness. Unfortunately, his wife neglected to write to Berlin, and a letter of admonition from a friend there missed him. The king, thinking he had broken his word and did not intend to return, hastily cashiered him, and the marquis, on hearing the news, as hastily returned to Aix, though not without grief and vexation. Before his departure from Berlin, he returned all the letters which he had at various times received from the king, telling him, in a written letter, that he thought it might not be right in the present state of his health to carry these marks of his majesty's confidence into a foreign country. The king returned the letters, with a reassurance of his confidence in the marquis. He died in 1771, while on a visit to his sister near Toulon, leaving a daughter, who inherited his property.

It is stated by all his biographers that he maintained the character of a good husband and master, and that he was always firm in his friendship. The natural ardour of his mind led him to make considerable acquisitions; he understood several languages, knew something of chemistry and anatomy, was a great reader of the fathers and doctors of the church, and of all sorts of polite literature. His works are:—

1. *Mémoires de Monsieur le Marquis d'Argens*, avec quelques *Lettres sur divers sujets* (fourteen not in the collections of his works); Londres, 1736, 12mo. (certainly a foreign print—Hague); 1737, Londres, 12mo.—1807, Paris, 8vo.
 2. *Mémoires du Marquis de Miremon, ou Le Philosophe Solitaire*; 1736, 12mo. An interesting work.
 3. *Mentor Cavalier*; 1736, 12mo.
 4. *Nouveaux Mémoires du Comte de Bonneval*, publiés sous le nom de *Mirone* (perhaps the name he took in Holland); 1737, 4 vols. 12mo. The *Mémoires de Bonneval* is an inferior work by another writer.
 5. *Mémoires du Comte de Vaxère, ou Le Faux Rabbín*; 1737, 12mo.
 6. *La Philosophie du Bon Sens*; 1737, 12mo.—1768, with Nos. 8, 15, and 16; called his works in 24 vols. 12mo.
 7. *Triomphe de la Vertu, ou Voyages sur Mer, et Aventures de la Comtesse de Bressol*; 1741, 3 vols. 12mo.
 8. *Lettres Juives*; 1742, 6 vols. 8vo.—1754, 8 vols. 12mo.
 9. *Lettres Philosophiques et Critiques*, par *Mad. Cochois*; avec les *Réponses de M. d'Argens*; 1744, 12mo.
 10. *Mémoires Secrets de la République des Lettres*; 1744, 7 vols. 12mo. These *Mémoires* contain notices of the lives, acts, and peculiarities of numerous writers that can only be found elsewhere by consulting a great variety of authors. The *Lettres Juives et Chinoises* contain similar notices.
 11. *Mémoires du Chevalier de ****; 1745, 2 vols. 8vo.
 12. *Songes Philosophiques*; 1746, 12mo.
 13. *Nonnes Galantes, ou l'Amour Embéguiné*; 1749, 12mo.
 14. *Réflexions Critiques sur les différentes Ecoles de Peinture*; 1750, 12mo. Much has been written upon this subject with great pretensions; but nobody has said so much as the marquis, so well, and in so few words, nor indeed anything more to the purpose. See also *Letters* in No. 1.
 15. *Lettres Cabalistiques*; 1754, 7 vols. 12mo.—1769, 7 vols. 12mo.
 16. *Lettres Chinoises*; 1755, 6 vols. 12mo.
 17. *Ocellus Lucanus*, Gr. et Fr.; 1762, 8vo.
 18. *Timée de Locres*, Gr. et Fr.; 1763, 8vo.
 19. *Défense du Paganisme*, par l'Empereur Julien, Gr. et Fr.; 1764, 8vo.—1768, avec des *Notes de M. de Voltaire*. Ces trois traductions ont des *Dissertations et Notes* sur les principales Questions de la Métaphysique, de la Physique, et de la Morale, qui peuvent servir de suite à la Philosophie du Bon Sens. These translations are very good.
 20. Certain pieces in the *Mémoires de l'Esprit et du Cœur* that bear his name; he had no part in the rest.
 21. Letters printed in the *Works of Frederic the Great*. The editor of his *Mémoires* (Paris, 1807) has collected what was necessary to complete his life, and has reviewed some of his works with considerable tact and delicacy, and not without censure where it is due. But where he accuses the marquis of making insidious attacks on religion through his priests, he expressly alludes to the religion of the church of Rome, to which the word is exclusively applied by all its writers. Writers of other sects, and their errors, are also remarked upon with great levity by the marquis; but many ecclesiastics have attacked each other with infinitely more virulence, and without a due regard to the decency which their order should never lose sight of.
- The marquis's name was again brought forward when, we are told, it was nearly forgotten in France, by the well meant zeal of certain declaimers against the licentious opinions which were promulgated during the revolution in the reign of Louis XVI. As all ranks and establishments were then thrown into confusion, so all names were confounded in searching for the authors of those calamities, and the Marquis d'Argens was associated with 'atheists and desolators of religion, morals, and government.' These words have been repeated by some who must be supposed to feel the very existence of the desolation they describe in the destruction of the old French government. More impartial writers have traced the causes of the French revolution to the accumulated grievances of many ages, and shown that it was not caused, though it may have been quickened, by the writers alluded to; if so, they may be classed together as instigators, but if their names are worth preserving, they are entitled to their just distinctions in biography. 'The marquis was not an atheist,' he says; 'he always thought: would be opposing his clearest notions not to believe in the existence of God;' he never abjured religion. After

his return to France, 'he manifested sentiments and exhibited acts of devotion that were not expected from him, considering his life and writings.' This only proves that those who did not expect such things were not acquainted with his habits—perhaps not with his writings, for he frequently asks, whether certain opinions and practices 'are consistent with true religion?' his objection to them being that he thinks they are not. The last of the sweeping accusations against him clearly indicates the temper of the person who first brought it forward, and of those who have copied it, whose thorough detestation of the Philosophy of Common Sense seems to have induced them to abandon the small portion of that valuable commodity which may have naturally fallen to their share. From their own biographical works it can be quoted that 'Frederic the Great was the best legislator of his day in Europe; that his people were the best governed; and that the Marquis d'Argens, a desolator of government, according to their ideas, was his confidential friend and adviser during the whole term of his literary life, lived under his special protection, died most sincerely regretted by him, and was, by his command, characterized on his monument as a lover of truth and an enemy of error.'

ARGENSOLA, BARTOLOME' LEONARDO DE, was a native of Barbastro in Aragon, and descended from a noble family, originally from Ravenna in Italy. He was born in 1566. He studied at the university of Huesca, and entered the ecclesiastical profession. Through the influence of his brother he was made a chaplain to the princess Maria of Austria, and rector of Villahermosa. He followed his brother to Naples, and remained in Italy three years after his death. In 1616, having first visited the principal cities in Italy, he returned to Spain, and was made a canon of Zaragoza, in which town he died, according to some authorities in 1633, and according to others in 1631.

Argensola left behind him a continuation of the *Annals of Aragon* by Zurita, a *History of the Conquest of the Molucca Islands*, some letters, satires, and other poetical effusions. The continuation of the history of Zurita, in point of style, exceeds the original, and the events are related with no less accuracy than freedom. The history of the Molucca islands, though it was written in his youth, is not inferior either in judgment or elegance to his later performances. As poets, both the brothers are, if not in point of originality, at least for their correctness and purity, among the first that Spain has produced. Their poetry is vigorous, abounds in wit and classic dignity of style, and above all, is marked by singular correctness of taste, on which account they have been styled the *Horaces of Spain*.

ARGENSOLA, LUPERCIO LEONARDO DE, brother of Bartolomé, was born in 1565, and began his studies at the university of Huesca. He afterwards went to Zaragoza, where he studied Greek, history, and rhetoric. Before he had attained his twenty-fifth year he went to Madrid, where his patroness, the princess Maria of Austria, had fixed her residence, and he was made her secretary. The archduke Albert of Austria made him his chamberlain, and Philip III. honoured his talents by appointing him historiographer of Aragon. The count of Lemos, having been appointed viceroy of Naples, took Argensola with him and made him his secretary of state, and also secretary for war. In 1613, he died at Naples. He left behind him three tragedies, some poems, and other works which are still unpublished.

(See Nicolao Antonio, *Bibliotheca Nova*; Fernandez, *Rimas de Lupercio y Bartolomé de Argensola*; Bouterwek, *History of Spanish Literature*, pp. 392-405.)

ARGENTAN, a town in France, in the department of Orne, 115 miles W. of Paris, twenty-five N. of Alençon, and thirty-four S. by E. of Caen: 48° 44' N. lat., 0° 1' E. long.

It is on the river Orne (which falls into the sea below Caen), and on an eminence in a very fertile plain. It is tolerably well built, with good broad streets, and its fortifications have been converted into a pleasant promenade. Near it are the ruins of a strong castle. The trade of Argentan is considerable. Lace similar to that of Alençon is made here; and also leather, the waters of the Orne being considered excellent for tanning. The cottons manufactured in the town and in its vicinity are carried to Caen and sold there, where they bear a good price. A considerable quantity of poultry is reared about the town; and there is an iron mine at no great distance. The village of Rye, in the neighbourhood, was the birth-place of the historian Mezeray. The population of Argentan is about 6000.

Before the revolution, Argentan possessed a priory and three other convents.

It is the capital of an arrondissement, or sub-prefecture, containing 248 communes and above 115,000 inhabitants.

The form of this word and of the next (Argenteuil) may be compared with some Celtic names which occur in the map of Gallia: Argentomagus (Argenton), between Poitiers and Bruges, Argentoratum (Strasbourg), &c.

ARGENTEUIL, a town in France, in the department of Seine and Oise, on the right bank of the Seine below Paris, just where the river serves as boundary between the department above-mentioned and that of Seine: $48^{\circ} 56'$ N. lat., $2^{\circ} 14'$ E. long.

It stands in the middle of a district abounding in vineyards and gardens, the produce of which forms the chief trade of the town. There are also in the neighbourhood quarries of gypsum, which furnish an abundant supply. Some ruins still indicate the site of a monastery, founded in the seventh century, which has acquired celebrity as the retreat of Heloise. [See *ABELARD*.] The lordship of the town was in the prior of the Benedictine monks, who appear to have occupied the monastery which once sheltered Heloise. Two other religious houses existed before the revolution. Population 4700. (*Reichard's Guide des Voyageurs*.)

ARGENTEUS CODEX, or Silver Book, the name given to a very curious manuscript, or rather fragment of a manuscript, containing the greater part of the Four Gospels in the Mæso-Gothic language, preserved in the library at Upsala, in Sweden. It is believed to be a relic of the Gothic Bible, all or the greater part of which was translated by Ulphilas, bishop of those Goths who were settled in Mæsia and Thrace, and who lived under the emperor Valens about A. D. 360. This curious fragment was discovered in the library of the abbey of Werden in Westphalia. The leaves are of vellum, some purple, but the greater part of a violet colour; all the letters being of silver, except the initials, which are of gold. These letters, which are all capitals, appear not to have been written with the pen, but stamped or imprinted on the vellum with hot metal types, in the same manner as book-binders at present letter the backs of books. This copy is judged to be nearly as antient as the time of Ulphilas, or at least not later than a century or two after.

Michaelis and one or two other learned men have opposed the current opinion, that the Silver Book contains part of Ulphilas's Gothic version, and have offered arguments to prove, that it is rather a venerable fragment of some very antient Francic Bible: but they have been confuted by Knittel and others. The letters used in the Gothic Gospels, being twenty-five in number, are formed, with slight variations, from the capitals of the Greek and Latin alphabets, and are believed to have been really the invention or application of Ulphilas. See the notes to Bishop Percy's *Translation of Mallet's Northern Antiquities*, vol. i. p. 366.

The Gothic Gospels of the Silver Book were first printed in types approaching to a fac-simile, by Junius, in 1665; again in common type at Stockholm, in 1671; by Mr. Lye at Oxford, in 4to, 1750, with a Gothic Grammar prefixed; and lastly, by Zahn, 4to, Weissenfels, 1805.

Palimpsest fragments of this Gothic version of the Scriptures, though not in the silver character, have been since found in other places. Knittel printed a fragment, containing part of the Epistle to the Romans, which was discovered in the library at Wolfenbützel: it was reprinted in 1763, by Professor Ihre; and again in the Appendix to Lye's Saxon Dictionary. In 1819, some further fragments were published by Angelo Mai, and Car. Oct. Castiglione, in 4to., at Milan, containing small portions of Esdras and Nehemiah, parts of the 25th, 26th, and 27th chapters of St. Matthew, of St. Paul's Epistles to the Philippians, Titus, and Philemon, and of a homily and calendar; these were discovered in separate leaves in the Ambrosian library at Milan.

A *Dissertation on the Argenteus Codex*, by Ericus Sotberg, printed at Stockholm, in 1752, contains two of its pages in fac-simile. Knittel and Mai have also engraved some of the palimpsest fragments which they respectively published.

ARGENTIE'RA, an island of the Grecian Archipelago, so called from its having been supposed to contain a vein of silver. It lies to the N.E. of Melos or Milo, from which it is separated by a narrow strait, only half a mile in breadth, which, though not free from dangers, may be passed through by ships of large size, the connecting ridge of the two islands having five fathoms water over it. The extreme length of

[Argentierra.]

the island is five miles, and breadth three miles and a half; it has no port, and but one small village, standing on an eminence at the S.E. side of the island, in $36^{\circ} 48'$ N. lat., and $24^{\circ} 35'$ E. long. It consists of only a few miserable huts; the whole population of the island does not exceed 800 souls. There are some hot springs in this island, like those in Milo, and the soil is also of the same volcanic nature, dry and barren, but producing in the valleys, with much care, a little cotton, corn, and fruit (chiefly figs and grapes). The only trade is the supply of a few kaik-loads of wine; for other articles the inhabitants visit Milo. The island generally is high; the hills rise to an elevation of 800 to 1000 feet. The antient name was Kimolos, which is still always used by its present Greek inhabitants.

This island was noted in antient times for an earth used in dyeing and bleaching cloths. (See Strabo, p. 484, and Plin. xxxv. 17, on the *Creta Cimolia*.)

ARGENTIE'RE, L', the capital of an arrondissement, in the department of Ardèche, in France. It is in the south of the department, in a deep valley, on the banks of the little river Ligne, one of the streams which run into the Ardèche: $44^{\circ} 32'$ N. lat., $4^{\circ} 17'$ E. long.

L'Argentière derives its name from the mines of argenteriferous lead (*i. e.* lead combined with silver), which were formerly worked in its neighbourhood, but are now exhausted or neglected, as being of little value. Its chief trade is in silk, of which there are several manufactories. The population is nearly 3000.

The air of the town is pure, though it is situated in so deep a hollow that its eastern part does not enjoy the sun's rays till the afternoon. The western part, being more elevated, fares better in this respect. A public library of 4000 volumes was established in the town as far back as 1784.

The arrondissement of L'Argentière contains 104 communes and 85,000 inhabitants. (*Dictionnaire Géograph. de la France*; Malte Brun, *Géographie de la France*.)

ARGENTINE REPUBLIC. [See LA PLATA.]

ARGENTON SUR CREUSE, a small town in the department of Indre, in France. [See INDRE.]

ARGIL. [See ALUMINA.]

ARGO, the ship, a southern constellation, the greater part of which, containing all the more important stars, is not visible in this country. It has one star of the first magnitude, CANOPUS (which see). The part of it which is visible in our latitude may be found in and above a line drawn through Orion's belt, and continued beyond Sirius. The star Cor Hydræ is just above the end of the mast, and the direction of the mast is that of a line passing through Regulus and Cor Hydræ. The latter comes on the meridian at six in the evening in the middle of May. For the mythological story connected with Argo, see ARGONAUTS.

The stars in Argo are as follows, in which, as before, the

simple number in the column marked Flamsteed, &c. is that of Flamsteed; () denotes Piazz; C, Lacaille; and Fa, Fallows.

Owing to the extent of this constellation, it is usual to subdivide it into four, between the stars of which dotted lines are drawn in the preceding table. They are named as follows: Argo in Carina (in the keel), Argo in Puppi (in the stern), Argo in Velis (in the sails).

The stars to which a note of interrogation has been placed are those about which some mistake has arisen in the catalogues. Thus the star which, according to Flamsteed, is 13 Argus, is really in Canis Minor: and 3 Argus, to which Flamsteed has affixed the letter τ , Lacaille has affixed l ; while τ Argus, according to Lacaille, is No. 579 of his own catalogue. (See *Memoirs of the Astronomical Society*, vol. iv. p. 291.)

ARGOL is an acidulous concrete salt which is deposited by wine, and forms a crust on the sides of vessels in which that liquid is kept. This crust becomes hard, brilliant, and brittle; it is easily reduced to powder. The colour of argol depends upon that of the wine from which it is separated. That which is deposited by white wine contains fewer impurities than the other, but when refined, the produce of both is identical. Argol brought from Germany is the most esteemed, and it is understood that the excellence of its quality is owing to the successive additions of new wine which are made from time to time during a series of years to the contents of the same casks or vats, which are commonly of large dimensions.

Argol is largely used by dyers as a mordant, that is, as an intermediate substance, which, having a stronger affinity for both the cloth and the colouring matter employed than exists between the cloth and the colouring matter, becomes, as it were, a bond of union between the two. It is employed also by dyers with another object, in combination with alum, the sulphuric acid of which would injure the texture of cloth, if it were not neutralized by the potass which argol contains. At the same time the tartareous acid, which is the other component of argol, combines with the alumina of alum and forms tartrate of alumina, which is decomposed by the cloth more easily than alum.

A further use is made of argol in the same art, by combining it with nitro-muriate of tin dissolved in water. A double decomposition is thus effected. The nitro-muriatic acid combines with the potass of the argol, while the tartareous

acid of this substance dissolves the oxide of tin. The mordant thus produced is therefore a tartrate of tin. These few explanations will perhaps suffice to indicate the purposes to which this substance is applied in the important art of dyeing. The chemical properties and further uses of argol will be described under the head of TARTAR.

About 3000 casks and cases (nearly 1000 tons) of argol are annually imported into this kingdom. It comes to us from almost all wine-producing countries. It is admitted at the trifling duty of two shillings per hundred weight from foreign countries, and half that rate from British possessions. The best, after that from Germany, comes from Bologna and the Cape of Good Hope; that shipped from Florence and Leghorn ranks next. Its present price varies, according to quality, from 42s. to 58s. per hundred weight, including the duty.

ARGOLIS, one of the antient divisions in the north-eastern part of the Peloponnesus: it is of a peninsular shape, being bounded on the south and north-east respectively by the Argolic and Saronic gulfs. On the west, it was separated from Arcadia by a range of mountains, which, shooting off from Cyllene, now Zyria, the highest mountain of the peninsula, not far from the frontiers of Achæa, run southwards, and were known by the appellations of Artemisium and Parthenium. Pausanias (viii. 6) mentions several passes from the plain of Argolis into Arcadia, two of which were respectively over the ranges of Parthenium and Artemisium. The territory of Corinth bounded it on the north. Argolis lies between $37^{\circ} 12'$ and $37^{\circ} 46'$ N. lat., and extended from $22^{\circ} 32'$ to $23^{\circ} 33'$ E. long. Its greatest length, measured in a straight line along its western frontier from Laconia to Corinth, was nearly thirty-eight miles, and the peninsular part of it varied from twenty-five to eleven miles in breadth. Mr. Clinton calculates (*Fasti Hell.* i. 385) its area in English square miles at 1059.

Argolis is traversed by a ridge of mountains which run nearly in a continued line through the peninsula, from Cyllene on its western frontier eastward to Cape Scyllæum, now Skylo; these mountains are intersected by deep valleys, through which flow rivulets, generally dry during summer. Arachnæum is the antient name of part of this range, which was crossed on the road from Argos to Epidaurus. The valleys are most numerous and of greatest breadth on the southern side of the ridge, but none of them are of any great extent. That in which Argos and Mycenæ were situated is the largest; and through it flowed the ancient Inachus, now Bânitzá. The coast is of an irregular shape, with numerous indentations, and it is generally low. The only good harbour is Nauplia, now Napoli di Romania, at the head of the gulf of Napoli; which, however, is exposed to a southerly wind.

Argos, with a territory around it of about 524 English square miles, was situated in the south-west part of the province near Mycenæ. On the eastern coast were the three independent republics, Epidaurus, now Pidhavo; Træzen, now Damala, and Hermione. In the mountains to the west was situated Phlius. The only other city of any importance in Argolis was Tiryns, the mythological birth-place of Hercules, and known for its Cyclopien walls. [See TIRYNS.] The district of Cynuria, which was long a subject of contention between Argos and Sparta, lay on the west side of the Argolic gulf, on the borders. (Thucyd. ii. 26. iv. 56, &c.) It was finally adjudged to the Argei by the Romans. [See ARGÆII and ARGOS: and Cell's *Argolis*.]

ARGONAUTA. [See NAUTILUS.]

ARGONAUTS, a term signifying the crew of the Argo, or members of the Argonautic expedition. This is one of the most remarkable of those mythological tales in which, as in the legends of the Trojan war, and the war of the Seven against Thebes, there is reason to believe that a substratum of truth exists, though overlaid by a mass of fiction. Anterior to these events (it is placed by Newton B.C. 937, by Blair B.C. 1263), the Argonautic expedition has a larger share of what is purely fabulous; the license of the poet being of course curtailed in proportion as the events which he related came nearer to his own times. No story has been more frequently treated by Grecian writers. We shall give a brief outline, and then offer a few remarks upon it.

Jason, the son of Æson, king of Iolcos in Thessaly, having been defrauded of his father's kingdom by his father's brother Pelias, in hope of recovering his paternal inheritance, undertook to bring from Colchis the golden fleece of the ram

which carried Phrixus thither. Argus, the son of Phrixus, by the help of Athene (Minerva), built the ship Argo, of fifty oars, at Pagasæ, and it was manned by the most celebrated heroes of Greece, in number fifty. The lists differ, for every state in later times wished to include its own national hero among them; but by general consent the most distinguished warriors, as Heracles (Hercules), the Æacids, the Dioscuri, Orpheus, Theseus, &c., were on board the vessel, which was steered by Tiphys, the son of Agnius. Embarking from Iolcos (or, some say, Apheta, *departure*), they steered first to Lemnos; thence to Mysia, where Hercules remained behind, seeking his favourite Hylas, who had been carried off by the Naiades, and drowned. (See Theocr. *Idyll.* 13.) They touched next at Bebrycia, where Amycus, king of the country, was slain by Polydeukes (Pollux), in boxing with the *cestus*, or weighted glove. (Theocr. *Idyll.* 22.) Apollonius next conducts them to the coast of Bithynia, where Zetes and Calais, the winged sons of Boreas, delivered the seer Phineus from certain winged monsters called Harpies, and in return he gave the Argonauts instructions for the conduct of their voyage. (Apoll. Rhod. ii. v. 178-425.) The entrance to the Euxine sea was fabled to be closed up by certain rocks, called *Symplegades*, *clashers*, or *Planktas* (Od. xii. 61), or *Cyanean*, which floated on the water, and when any thing attempted to pass through, came together with such velocity that not even the birds could escape. Phineas advised them to let fly a pigeon, and to venture the passage if the bird got through safe. It passed, with only the loss of its tail; and the Argo, favoured by Juno, and impelled by the utmost efforts of its heroic crew, passed also, though so narrowly that the meeting rocks carried away part of her stern-works. Thenceforward they remained fixed. The expedition reached the river Phasis without any more adventures worthy of notice. Æetes, king of Colchia, hearing from the strangers the cause of their arrival, promised to give Jason the golden fleece, which was suspended on a tree in the sacred grove of Ares, on condition of his yoking two bulls with brazen feet, which breathed flames, ploughing a piece of land with them, and sowing part of the teeth of the serpent slain by Cadmus, which had the peculiar property of producing a crop of armed men. These difficult tasks he performed by the help of the celebrated sorceress Medea, daughter of Æetes, who fell in love with him, placed the fleece, which Æetes ultimately refused to surrender, in his possession, and became his partner in flight.

How the Argo got back to Greece, it is not easy to say; but somehow or other she found her way from Colchis, at the eastern end of the Euxine, to the western extremity of the Mediterranean. Here the Argonauts touched at Æea, the island of Circe (see Od. xii. 69), which by Homer is placed in the westernmost part of the Mediterranean, and by some later writers has been said to be the promontory of Circæum, on the Latian coast. Hence they passed all the wonders of the western world described by Homer: the Sirens; Scylla and Charybdis; Thrinakia (Sicilia), the isle of the sun; and Phæacia, or Coreya. Near Anaphe, one of the Sporades, they narrowly escaped shipwreck, but were saved by Phœbus. They touched at Crete, proceeded to Ægina, thence to Iolcos, where Jason delivered up the fleece to Pelias; after which he sailed to the Isthmus, and dedicated the Argo to Poseidon, or Neptune.

For a full account of the adventures of the Argonauts, see, besides the passages referred to, Pindar. *Pyth.* IV.; Apollonius Rhodius; the Orphic *Argonautica*; Diodorus, book iv. c. 40; see also Hesiod. *Theog.* 992; Ovid, and the Latin poem of Valerius Flaccus, entitled *Argonautica*.

The reader will readily understand that it was a difficult matter to get the Argo home from Colchis to Greece, by way of the Mediterranean. Besides numerous large streams, two very great rivers, the Ister and Tanais (Danube and Don), flowed into the Euxine sea, from the west and north-east respectively, in addition to the Phasis (Faz), which entered it on the east side, within the limits of Colchis. Of none of these did the early Greeks know either the rise or course; and this was convenient, for they could do as they liked with them. Pindar (*Pyth.* iv. 44 and 448) conducts the Argonauts into the 'Red Sea' (probably the Indian Ocean), and by the ocean to the coast of Libya, where they carried their ship over land for twelve days, and launching her into Lake Tritonis, entered the Mediterranean. According to the tradition preserved by He-

rodotus (iv. 179), Jason was driven off the south coast of the Peloponnesus into the shallows of the Lake Tritonis, while he was on his voyage (apparently before the commencement of the great expedition) to carry a hecatomb and a brazen tripod to the god of Delphi. He only got out of the difficulty by surrendering the tripod to Triton, the god of the lake, who on no other terms would consent to pilot him out. Hecateus of Miletus improved the story, by making them sail from the ocean down the Nile, into the Mediterranean. Pisander and Timagetes, followed by Apollonius Rhodius, carried them up the Ister, and down one of its branches, by which they perhaps meant the Rhone, into the Celtic or Tyrrhene sea. Timæus and others took them up the Tanais to its source, from which they dragged the Argo to an unnamed stream, which carried them to the ocean, and they sailed home by Gades (Cadiz), that is, the straits of Gibraltar. The poet who writes under the name of Orpheus took them up the Phasis down another branch of it to the Palus Mæotis, at the head of which they entered a river, probably the Tanais, and crossed the Rhipæan mountains to the Cronian or Baltic sea. They passed by the land of the Cimmerians, and the isle Iernis (Ireland?), and home by the strait of Tartessus (Gibraltar) into the Mediterranean.

The gross geographical ignorance involved in each of these routes need not be pointed out. Why later writers should have laboured to solve such an impossible problem, it is hard to say, except that Homer brings the Argonauts into the Mediterranean (Od. xii. 70), and they may have thought themselves bound to follow him. Diodorus, however, takes them quickly home by the Euxine Sea.

The name of Minyans, which was given to the Argonauts, according to the mythologists, because most of them were descended from Minyas, son of Poseidon on the maternal side, has led Mr. Keightley (*Mythology*) to suggest that the expedition may have been in fact undertaken by the Minyans, an early race in Greece, probably a branch of the Æolian tribe, who inhabited the southern part of Thessaly, and whose port was Iolcos, and their deity Pagasæ, and who are conjectured to have been a wealthy and commercial race. (Müller's *Orchomenos*; and Buttmann's *Mythologus*, ap. Keightley.)

Mr. Keightley further suggests, that the voyage may in fact have been to the west, for the wool and gold of Spain, and that this explains the universal agreement of all writers in bringing the Argonauts home by the Mediterranean; while at the same time the commodities for which the voyage was undertaken might readily be mythologized into the legend of the golden fleece. We prefer, however, the simpler belief of Mitford and others, that the expedition was of a piratical nature, on a large scale; in which, according to the notions of honour of the age, a number of young men of the highest rank and spirit engaged under one celebrated leader. The notion of the expedition being a warlike one seems to be untenable; the bold attempt of exploring the Black Sea, with the mingled objects of plunder, curiosity, and traffic, appears to be a more natural story. (See Herod. i. 2.) As to the Argonauts being found in the western part of the Mediterranean on their return, this notion arose, as we have already intimated, from the ignorance of the later Greeks as to the true course and character of the great streams which enter the Euxine or Black Sea on the north. When the geographers of Strabo's time (Strabo, *Canaan* p. 121.) could believe, in opposition to the earlier statement of Herodotus, that the Caspian lake was as far or bay of the ocean running southward into the land, we may easily conceive how the ignorance of a previous age connected the Euxine with the waters of the ocean. When the Euxine was explored, so as to leave no doubt of its true character, ignorance and credulity merely transferred the same hypothesis to the Caspian. The wanderings of Io, as given in the *Prometheus* of Æschylus, are a good sample of poetical geography, which may be compared with that of the Argonautic voyage.

Bryant, in his learned work on ancient mythology, considers this expedition of the Argonauts as one of those corrupt traditions in which the recollection of the Deluge, and the preservation of mankind in the ark, was long maintained. Jason, therefore, he believes to be the arkite deity, and the name of Argo to be connected with and derived from the ark itself. The reader will find this question discussed with great research and ingenuity in his *Jason's Mythology*; but the author's prejudices in behalf of an

favourite theory are so strong, that his arguments require to be examined with more than usual care.

ARGONNE, a woody district in France, on the frontier of the ancient provinces of Lorraine and Champagne, and extending into each of them. It is now included in the departments of Meuse, Marne, and Ardennes. It is about sixty miles in length, with a very unequal breadth. It may be described as a vast forest, in the intervals and void spaces of which, towns and villages have been built. The inhabitants of these cultivate the lands in their neighbourhood; but the badness of the soil, and the quantity of deer, and animals of that kind (*bêtes fauves*), render tillage an unprofitable pursuit, and lead the inhabitants to attend rather to rearing stock. The cattle and the wood, which is so abundant, furnish the chief articles of trade. St. Menehould was the capital of this country, and among the other towns which are situated in it, are Clermont, Varennes, Beaumont, and Grandpré. Some of these take from the district a distinctive addition to their name, as Clermont-en-Argonne, Beaumont-en-Argonne, &c.; just as in England we have Henley-in-Arden, &c. [See **ARDEN**.]

Argonne was the great scene of operations in the Duke of Brunswick's invasion in 1792, when the enthusiasm of republican France enabled her new levies to triumph over the disciplined forces of Prussia and Austria, and expel them from her territory. (*Encyc. Méthod. Dictionnaire de la France*.)

ARGOS, called also Argi by Latin writers, the most ancient city of the Peloponnesus, the chief city of Argolis, is situated on a level plain at the foot of a hill called Larissa, on which was its citadel and a temple of Jupiter, and on the banks of the rivulet Inachus, now Banitza. We admit the fact of its high antiquity, but we do not venture to decide whether its foundation took place B.C. 1857, as Eusebius affirms, or B.C. 1886, which is the opinion of Larcher. Its earliest known inhabitants were Pelasgi. In the remains of the Acropolis on the hill Larissa, we see traces of walls approaching to the massive Tirynthian style (see **TIRYNS**), and others of the later polygonal kind, which is characterized by the absence of regular horizontal courses, and by the accurate fitting together of the stones. In the mythic age it was governed by kings, of whom Inachus was the first; or, according to other accounts, he was the river-god, and his son Phoroneus was the first king. (Paus. ii. 16.) Danaüs, from Egypt, afterwards founded a new dynasty by wresting the sovereign power from Gelanor, a descendant of Phoroneus. Herodotus, in his story of Io, whom he calls the daughter of Inachus (i. 1.), a story in itself of no historical value, states the general belief as to the importance of Argos at this remote period, and indicates that it was known to the enterprising merchants of Phœnicia. According to Homer, the city Argos belonged to the kingdom of Diomedes, and not to that of Agamemnon, who however seems to have enjoyed a kind of sovereign power over the whole peninsula.

[Silver Coin of Argos. Brit. Mus.]

Under Pheidon, in the 8th Olympiad, the power of Argos appears, for a time at least, to have acquired a considerable extension. [See **PHIDON**.]

In the more certain historical age, Argos appears under a republican form of government, and becomes first known to us when engaged in war with the Spartans respecting the territory of Thyrea. This war was contemporaneous with the capture of Sardes by Cyrus. (Herod. i. 82.) Before this epoch, the possessions of Argos had extended to Cape Malea, and included Cythera and other islands. At a later period, B.C. 493, there was another contest between Argos and Sparta, in which Argos was unsuccessful, and so many of the citizens fell in battle, that the slaves, or more probably the Pericæi, found no difficulty in seizing the government, and are said to have retained it till the sons of their masters had grown up, when they were again expelled from the city. (Herodot. vi. 83.) It was probably on this account that the Argeians took no part in the Persian war B.C. 480, though many much less creditable reasons for

their conduct were afloat in Greece at the time. It was, in fact, believed that they had been bribed by Xerxes; but Herodotus is evidently unwilling to credit the story. (vii. 148—152.) A few years afterwards, B.C. 468, we find them at war with the inhabitants of Mycenæ, who had refused to acknowledge the supremacy of Argos, and had been supported for many years in their independence by the Spartans. Mycenæ fell, and it never again rose from its ruins. (Diod. Sic. xi. 65.) [See **MYCENÆ**.]

Though Argos remained neutral during the earlier part of the Peloponnesian war, her feelings were at all times opposed to the Spartans, and she at last took an active part with the Athenians. The defeat, however, of the Argeians at Mantinea, B.C. 418, dissolved the confederacy, of which she was the head, and Argos was compelled to accept an aristocratical constitution. (Thucyd. v. 65-81.) She subsequently shook off the yoke, and we find her assisting the Thebans at the battle of Mantinea, B.C. 362; but her history becomes gradually less important; nor is there any fact worthy of being noticed, till the unsuccessful attempt made by Pyrrhus, B.C. 272, to take the city. It joined the Achaean league, and continued to form a part of this confederacy till its final dissolution by the Romans. (Strabo, viii. 377.) The great deity of Argos was Hera (Juno), and it seems probable that a great catalogue of the priestesses had been preserved, which may have served as the basis of the work ascribed to Hellanicus on the succession of the priestesses. (See Herod. i. 31. Thucyd. ii. 2.)

Argos is still known by its ancient name, and at the beginning of this century contained 1200 families. Part of the plain around is cultivated, and where the moisture is sufficient, cotton and vines are grown: in the marshy parts towards the sea, some rice. The plain of Argos does not abound in water, for which Pausanias assigns a mythological reason (ii. 15: but compare Strabo, p. 371.) A ruined castle, of lower Greek construction, which now occupies the summit of Larissa, still preserves some remains of the famed Acropolis of Argos. For a detailed account of its ancient remains, see Leake's *Travels in the Morea*, London, 1830; and for its ancient history, Mannert's *Geographie des Griechenlandes*, Leips. 1822. Pausan. ii. 19, &c.; Strabo, p. 368, &c.; Müller's *Dorians*.

ARGOS, in Amphiloehia, a town near the S. E. angle of the gulf of Arta. Its ruins are supposed by some to be those at the bottom of the gulf of Karavasara. (See *Lond. Geog. Journal*, vol. iii. p. 85, and the article **ARTA**.) This Argos was founded, according to tradition, by Amphiloehus of the Peloponnesian Argos, after his return from the war of Troy. (Thucyd. ii. 68.)

ARGOSIE, a ship of great burthen, whether for merchandise or war. Shakspeare, in his *Merchant of Venice* (Act i. Scene 1) says—

Your mind is tossing on the ocean,
There where your *Argosies* with portly sail,
Like signiors and rich burghers on the flood,
Or as it were the pageants of the sea,
Do over-peer the petty traffickers.

It is mentioned in the same sense by Chapman, Drayton, Beaumont and Fletcher, and other writers. In Rycaut's *Maxims of Turkish Policy*, chap. xiv. it is said, 'Those vast caracks called *Argosies*, which are so famed for the vastness of their burthen and bulk, were corruptly so denominated from Ragosies,' i.e., ships of Ragusa, a city and territory on the Gulf of Venice, then tributary to the Porte. We have no proof, however, that the Ragusan vessels were particularly large; and it seems more likely that the *Argosie* derived its name from the classical ship *Argo*. Indeed Shakspeare himself has hinted as much in the play just quoted, when he makes Gratiano, in allusion to Antonio's *argosie*, say (Act iii. Scene 2)—

'We are the Jasons; we have won the fleece.'

Sandys, in his *Travels*, p. 2, applies the term *argosie* to a ship of force. Describing the boldness of pirates in the Adriatic, he observes, that from the timorousness of others they 'gather such courage that a little frigot will often not fear to venture on an *argosie*.'

ARGO-STOLI. [See **CEPHALONIA**.]

ARGUIN, or **ARGUIM**, one of a cluster of small islands in a bay of the same name, about fifty miles to the S.E. of Cape Blanco, on the western coast of Africa. It is only about two miles long, and would be unworthy of notice were it not for the variety of masters to whom it has been subject, and the loss of life incurred there. It was discovered in 1444, by Nunez Tristão, and in 1461 a fort was erected for

the protection of commerce, then consisting of gold and negroes, which were received in exchange for cloths, knives, glass-beads, bells, &c. The Portuguese remained in quiet possession till 1638, when they were driven out by the Dutch, who established a traffic with the Moors in gum Arabic, and claim the merit of being the first to introduce that article into Europe. The bay also abounded in stock-fish, which they cured with salt, obtained from the opposite shore and exported to Holland. In 1665, the fort was destroyed by an English squadron; but the Dutch, recapturing the island in the following year, strengthened it very much, entered into an alliance with the Moorish chiefs, and by giving a high price for the gums greatly injured the trade of the French Senegal Company. In consequence an expedition was sent, which drove the Dutch out, and the island was ceded to the French by the treaty of Nimègue. It appears that in 1690 the French exported hence a thousand tons of gum Arabic, with many chests of ostrich and herons' feathers, and a quantity of ambergris. The Dutch, however, still carried on their trade in spite of the French company; but in 1725 they were finally driven away, and the gum trade gradually merging into the establishments on the Senegal, Arguin has been abandoned, and subsequently to the treaty of Versailles in 1763 the forts have been demolished.

The opposite coast of the main land is only a barren tract of sand; but the country inland is described as being fertile, yielding corn and fruit in abundance. The country of the gold-mines, called Darha, is fifty leagues in the interior. The anchorage was good, and the bay afforded plenty of turtle and fish.

Arguin has been supposed by Major Rennell to be the Cerne of Hanno; and Bougainville asserts that the cisterns found there are of Carthaginian construction. The largest of these cisterns (evidently an artificial work) is 96 feet long, 60 wide, and of considerable depth: it is situated about 400 yards from the ruins of the fort. There is plenty of fresh water on the island.

An extensive and dangerous shoal, called the Arguin Bank, stretches thirty leagues along the land in a S.S.E. direction, from off Cape Blanco to Cape Mirik; it is composed of hard sand with broken shells; a strong current sets along its edge to the southward. This was the scene of the melancholy wreck of the French frigate *La Méduse*. Arguin is in $20^{\circ} 24'$ N. lat., $16^{\circ} 14'$ W. long.

ARGUMENT, in astronomical tables, is the angle on which the tabulated quantity depends, and with which, therefore, in technical language, the table must be *entered*. If, for example, a table of the sun's declination were formed, corresponding to every degree, &c. of longitude, so that the longitude being known, the declination might be found opposite to it in the table, then the longitude would be made the *argument* of the declination.

ARGYLE, or **ARGYLL**, a shire in the west of Scotland, comprehending an extensive district on the main land, and several of the Hebrides, or Western Isles. The name is said to be derived from *Earra Ghaidheal*, the West Gaël's country. It is bounded on the N. by Inverness-shire; on the E. by Perth, Dumbarton, and Renfrew shires; from the last two it is separated by Loch* Long and the Firth of Clyde. On other sides it is washed by the sea; but the islands of Bute and Arran, which form the shire of Bute, lie close to it to the S.E. The line of the coast is very irregular: Deep indentations of the sea penetrate far inland. The principal of these, beginning from the N. are Loch Moidart and Loch Shiel (communicating with Loch Moidart by a narrow passage), which separate Argyshire from Inverness-shire; Loch Sunart, which runs into the land in an eastern direction; Linnhe Loch, which runs nearly N.E., and the extremities of which are Loch Eil (which runs first N.E., and then W. by N. till it approaches Loch Shiel), and Loch Levin; Loch Creran and Loch Etive are inlets of Linnhe Loch, on the right as you enter. From Linnhe Loch, the coast runs in a direction about S. by W. for a distance of between 80 and 90 miles (broken successively by the Lochs Feochan, Melfort, Craignish, Crinan, Swin, Killisport, and West Tarbet), to the Moyle or Mull of Cantire. From this headland, the coast, after running eastward a short distance, returns N. by E. for about 35 miles to Skipnish Point, forming the long narrow peninsula of Cantire. From Skipnish, Loch Fine runs inland first N. by W., then N.E., and has a subordinate inlet; Loch Gilp,

Lochs Riden and Straven also run N. by W., or N.; and the Firth of Clyde, with its terminating lochs, Long and Goyle, completes the circuit of the Argyshire coast, the extent of which is estimated at more than 600 miles.

Authorities differ considerably as to the dimensions of Argyshire: we give the following from measurement on the Map of Scotland published by the Society for diffusing Useful Knowledge.

Length from the northern extremity of the county in the territory of Lochail to the Mull of Cantire, 115 miles.

Length from the point of Airdnamurchan to the Mull of Cantire, 101 miles.

[Statement in Dr. Smith's Survey of the Agriculture, &c., of the County (1798), 115 miles.]

Breadth from the point of Airdnamurchan to the border of Perthshire, near the source of the river Urchay, 66 miles.

[The breadth is given by Dr. Smith at 68 miles.]

There is equal diversity of statement as to the superficial contents; Dr. Smith's calculation is as follows:—

	Sq. miles.
Mainland, exclusive of Cantire	2475
Peninsula of Cantire	260
Islands	1063
	3798

But the Doctor gives this statement as conjectural, in the absence of good authority; and as he appears to have over-estimated the length and breadth of the county, it seems better to take the statement in the *Gen. Report of Scotland*, drawn up under the direction of Sir John Sinclair, Appendix, vol. i. pp. 49, 58 (1814):—

	Sq. miles.	Eng. acres.
Land on the main	2200 or	1,408,000
Lakes	60	—
Islands	929 or	594,560

3189 or 2,002,560, more

than one-tenth of the whole surface of Scotland and its islands.

Of the land, the quantity in cultivation is —

	Eng. acres.
On the main land	163,970
Islands	107,020

270,990, about

13.5 parts in 100, or between one-seventh and one-eighth of the surface of the county; and between one-eighteenth and one-nineteenth of the cultivated land in Scotland.

The islands attached to Argyshire are as follows. The length and breadth are given from measurement on the Society's map; the proportion of land in cultivation is from the *General Report of Scotland*; the population from the census of 1831:—

Canna: greatest length, $4\frac{1}{2}$ miles, E.N.E. to W.S.W.; greatest breadth, 1 mile; proportion of land cultivated in Canna and its dependency, Sandy Island, 45 parts in 100; population, 264.

Rum: greatest length, 8 miles, N. to S.; greatest breadth, $7\frac{1}{2}$ miles; proportion of land cultivated, 6 parts in 100; population, 134.

Rum is the most mountainous and rugged of all the Hebrides.

Muck, Muick, or Monk: greatest length, 2 miles, E. to W.; greatest breadth, $1\frac{1}{2}$ mile; population, 155.

Muck contains good pasturage and excellent corn land. The above islands, with the isle of Eig or Egg, lying between Rum and Muck, but included in Inverness-shire, make up the parish of Small Isles, one of the most laborious ministerial charges in Scotland. The population here has been rapidly decreasing, as appears by the statement below:

	Population in 1831.	Diminution.
Canna	436	264
Rum	394	134
Muck	321	155
	1151	553

Coll: greatest length, 12 miles N.E. to S.W.; greatest breadth, $3\frac{1}{2}$ miles; proportion of land cultivated, about one-third; population, 1316.

Tirree, or Tir-y, or Tyree: greatest length, 13 miles N.E. to S.W.; greatest breadth, $6\frac{1}{2}$ or 7 miles; proportion of land cultivated, 30 parts in 100; population, 4453. The dimensions of this island, which is not included in the So

* Loch is a lake, and also an inlet of the sea.

ciety's Map, are given from Langlands and Son's Map of Argyleshire, 1801.

Mull: greatest length, 29 miles, from Duart Castle, N.E., to the point opposite to Holmin Island, S.W.; greatest breadth, 28 miles; proportion of land cultivated, 8 parts in 100. The following islands are dependencies of Mull:—Gometray: greatest length, 2 miles, E. to W.; greatest breadth, $1\frac{1}{2}$ mile. Ulva: greatest length, 5 miles, E. to W.; greatest breadth, $1\frac{1}{2}$ mile. Staffa: dimensions under a mile. I-calm-kill, or Iona, antiently called Sodor: greatest length, $3\frac{1}{2}$ miles, N.E. to S.W.; greatest breadth, 1 mile; all arable or good pasturage: and several smaller islands. Population of Mull and its dependencies 10,538.

Lismore: greatest length, $10\frac{1}{2}$ miles, N.E. to S.W.; greatest breadth, $1\frac{1}{2}$ mile; one-half cultivated, very fertile; population, 1790.

The Islands of Lorn: 35 parts in 100 cultivated; the population cannot be given, as it is included in that of the parishes on the main land to which they belong.

Kerrera, or Kervera: greatest length, $4\frac{1}{2}$ miles, N. by E. to S. by W.; greatest breadth, 2 miles.

Seil: greatest length, 4 miles, N. by E. to S. by W.; greatest breadth, 2 miles.

Easdale, or Eysdill: dimensions under a mile: famous for its slate quarries.

Luing: greatest length, 7 miles, N. to S.; greatest breadth, $1\frac{1}{2}$ mile.

Shuna: greatest length, $2\frac{1}{2}$ miles, N. to S.; greatest breadth, 1 mile*.

Lunga: dimensions about or under a mile.

Scarba: greatest length, 3 miles, N.E. to S.W.; greatest breadth, $2\frac{1}{2}$ miles.

Jura: greatest length, 25 miles, N.N.E. to S.S.W.; greatest breadth, 8 miles; proportion of land cultivated, 7 parts in 100; population, 1312.

Colonsa and Oronsa: greatest length, 10 miles, N.N.E. to S.S.W.; greatest breadth, 3 miles; proportion of land cultivated, two-fifths; population, 893.

These are counted as one island, and their united dimensions given, as the channel between them is dry at low water.

Isla or Ilay: greatest length, 26 miles, N. by E. to S. by W.; greatest breadth, 21 miles; one-fourth cultivated or in woods or pastures; population, 14,992.

Gigha: greatest length, 5 miles, N.E. to S.W.; greatest breadth, 2 miles; proportion of land in cultivation, 30 parts in 100: population, 534

Sanda (a small island near the southern point, or Mull of Cantire): greatest length, nearly 2 miles N.E. to S.W.; greatest breadth, about a mile.

Several of these islands deserve further notice for their magnitude, productions, or other circumstances. [See IONA, ISLA, JURA, MULL, and STAFFA.]

The population of the islands, as given above, amounts to 35,065: that of the whole shire, at the same period, amounted to 101,400, leaving 66,335 for the main land.

Argyle is mountainous; and presents an appearance more pleasing to the lover of the picturesque than to the agriculturist. The barrenness of the soil and the want of cultivation are shown by the scanty population, which amounts only to about 32 for every square mile of land in the shire, or 1 for every $2\frac{1}{2}$ acres under cultivation.

The northern and eastern parts, where it borders on the Grampians, are the most rugged: along the coast the ground is in general lower and more level, yet particular mountains near the sea rise to a great height, and are indeed among the loftiest in the shire. We subjoin a table of the principal:—

Cruchan Ben, between Loch Etive and Loch Awe	Feet.	3669
Benmore, in the Isle of Mull		3168
Cruch Lussa, to the E. of Loch Swin	(S)	3000
Beden na bean, or Bedan ambran, N. of the termination of Lake Etive	(L)	2720
Paps of Jura, on the Isle of Jura		2580
Buchael Etive, or Buachaille, N.E. of the extremity of Loch Etive	(L)	2537
Ben na hua, on the N. side of Linnhe Loch		2515
Ben Ima, Ben Arthur, or the Cobler, at the extremity of Loch Long	(S)	2389
Ben More, in Rum		2310

* There is another Shuna off this coast, N.E. of Lismore, and a Shona in Loch Moidart, between Argyle and Inverness shires.

Ben ea Tan, S. of Loch Sunart	2306
Slia Gaoil, between Loch Killisport and Loch Fyne (S)	2228
Crock Moy, in Cantire	(L) 2036
Oreval, in the Isle of Rum	1800
Ben Tuirek, in Cantire	1515
Ben Varn, in Isla	1500
Isle of Scarba	1500
Ben Ronastill, in Isla	1050
Isle of Canna	810
Ben Tarteil, in Isla	762
Cliffs near the Mull of Oe, in Isla	750
Isle of Muck	600
Ben Oe, in Isla	546
Isle of Sanda, near Mull of Cantire	300

The above, where they have no distinctive mark, are from the *Map of Scotland* published by the Society for diffusing Useful Knowledge: those marked (S) are from the Appendix to the *General Report of Scotland*, drawn up under the direction of Sir John Sinclair (1814); and those marked (L) from a table of heights given with Langlands' *Map of Argyleshire* (1801).

The chief rivers in the county are, the Urchay, which rises in the Grampians and flows into Loch Awe, an inland lake lying in a direction nearly parallel to Loch Fyne; and the Awe, which serves to connect Loch Awe with Loch Etive, and through it with the sea. The basin of these streams is estimated at 250 square miles. Streams of smaller importance are numerous, as the nature of the country would lead us to expect. There are no large inland lakes except Loch Awe just mentioned, which is about 24 miles long from N.E. to S.W., and from half a mile to two miles and a half broad. It is thickly studded with small green islets, and surrounded with picturesque scenery of woods and mountains.

Argyleshire is divided into six districts: 1. Mull, including the island of that name, and its dependent isles, with Canna, Rum, Muck, Coll, Tiree, and Airdnamurchan, Sunart, Ard-gower and Morvern, N.W. of the Linnhe Loch, which separates these divisions from the rest of Argyleshire: 2. Lorn, a large division, comprehending the subordinate districts of Appin, Benederaloch, and Muchairn; with Glen Urchay or Glenorchy, Glen Etive, and Glen Co; the island of Lismore and those grouped together, as the islands of Lorn: 3. Argyle proper, or Inverary; separated from Lorn by Loch Melfort, Loch Avich (which is united by a channel with Loch Awe), and Loch Awe, and by a line drawn S.E. from the last mentioned lake to the eastern frontier of the county: 4. Cowal, including the district S.E. of Loch Fyne: 5. Cantire or Kintyre (including Killislate), a long peninsula, formed by Loch Killisport, the ocean, the Sound of Kilbrannan (which is the strait between the Isle of Arran and the mainland), and Loch Fyne; the Island of Gigha is joined to and forms part of Cantire: 6. Isla or Ilay, including the islands of Isla, Jura, Colonsa, and Oronsa, with a small part of the continent between Argyle and Cantire. Knapdale is divided between districts 5 and 6.

With respect to the geology of Argyleshire, granite forms the principal constituent of the mountain masses which stretch from the river Awe, N.E. into Perth and Inverness shires; it also extends along the N.W. shore of the Linnhe Loch in the districts of Morvern and Sunart. Mica-slate predominates in nearly every other part of the mainland, together with the islands of Isla, Jura, Colonsa, Oronsa, Coll, Tiree, and the south part of Mull. It constitutes the mass of the Grampians (which form the E. border of the county) and of the mountains of Cantire. Floetz trap prevails in Canna, Rum, and the north side of Mull; in some districts, of no great extent, along the coast of Airdnamurchan and Morvern; and in the neighbourhood of Campbeltown in Cantire. A small extent in the last mentioned neighbourhood is occupied by the coal formation and the rocks connected with it, being perhaps part of the great coal-field of Scotland, and serving as a link between that and the coal formation of the North of Ireland. The columnar basalt will be noticed under the head of STAFFA.

The minerals which are turned to economical purposes are numerous. There are lead-mines in several places, as at Strontian near the extremity of Loch Sunart; at Tyn-drum on the border of Argyle and Perth shires, and in the islands Isla and Coll. Copper was obtained from a mine in Kilmartin in the district of Argyle, but the mine is no longer worked. A vein is, however, worked in the island of Isla. Coal is obtained in the neighbourhood of Campbeltown. There are seams of coal also in Mull,

but not sufficient to defray the expense of working them: peat is the common fuel, except at Inverary and Campbeltown, and at gentlemen's houses on the coast. The slate-quarries of Easdale island have been among the most considerable in Britain; and there are quarries at Balaclulish or Balahulish in Appin in Lorn. In the Appendix to the *General Report of Scotland* (1814), the yearly produce of the quarries in Easdale and the other islands of Argyshire is stated at 5,000,000 slates; and the produce of those at Balaclulish and other parts of the mainland of the same county, at 3,000,000. Marble is procured in several places, of various quality and colour: among the most beautiful specimens is that of the island of Tirree, which is very hard, and takes a good polish. Limestone is abundant in most parts of the county. The granite quarried near Inverary takes as fine a polish as marble; and the *lapis ollaris* (a kind of micaceous slate), with which the Duke of Argyle's castle at that place is built, is one of the handsomest of the building-stones found within the borders. The earth strontian takes its name from the place so called near Loch Sunart, where it was found and first analysed. In Glenorchy in Lorn, specimens of cobalt are found; and the coasts of Cantire towards the south end, and of the isle of Colonsa, abound with coral.

Argyshire has a very variable and moist climate, but from its situation on the coast, and from the numerous inlets of the sea by which it is so deeply indented, the temperature is mild. Frost seldom continues long on the sea-coast, and snow rarely lies more than two or three days at a time. Mildew, blight, and hoar-frost seldom do much injury to the husbandman. The north-eastern parts, bordering on the Grampians, have a colder climate; though even there the valleys, sheltered by the surrounding heights, are neither so cold nor so uncomfortable as might be expected.

The farmers of this county direct their attention chiefly to the breeding of stock and the feeding of sheep, for which the rough and mountainous character of the surface is better adapted than for tillage. There is, indeed, a considerable quantity of arable and improveable ground in the vales interspersed among the mountains, and along the margin of the streams which wind through them, but the chief proportion of arable land is on the coast. The soil varies materially: by the rivers and by the sea there is a light loam, mixed with sand or gravel, on a clay or gravelly bottom, while on the sides of the hills there is a light gravelly soil. Sometimes the soil of the lower grounds has a mixture of clay, and sometimes of moss. The pasture grounds differ much, and the difference is manifested by the produce; in one place there is sweet fine grass; in another, coarse grass and rushes. Moss and marshes occupy a part of the flat grounds; and heath covers a large portion both of the hills and flats. The tops of the highest hills are usually quite barren.

The farmers (with the exception of the tacksmen, a kind of intermediate class between the land-owners and the great body of the farmers), owing to the small size of their farms, the short terms of their leases, and their want of capital, are in a dependent and even depressed state. They excel in rearing live stock, and in the knowledge of the diseases of their cattle; but are regarded as deficient in general industry and skill, wedded to old customs, and unwilling and unable to promote improvements. The principal kinds of grain raised are oats, and bear or big, a species of barley much used in distilling. Wheat and rye are cultivated in Cantire, though to a small extent. Peas and beans are grown, but not to any large amount; and flax is raised for family use. Potatoes are cultivated extensively, and serve as a staple article of food for a considerable part of the population. Turnips, cabbages, kail, and the artificial grasses, are little attended to, except in Cantire, and there not to any considerable extent. As late as the commencement of the present century, the old custom of ploughing with four horses abreast, the driver walking before them backwards, was kept up in many parts; but as it was then yielding to improved methods, it is probably now nearly or quite done away. The rotation of crops is not well understood; grain crops are raised with little interruption, on the same ground, till it is exhausted. (Smith's *General View of the Agriculture of Argyle*, 1798.) Although there is a considerable extent of meadow-land, the quantity of hay made is not great. It is usually cut in August; the artificial grasses in July. The bear harvest begins in general in the middle of August, and is followed by the harvests of oats (middle

of September), beans, peas, and potatoes, in succession. The inhabitants, even the poorest, have usually gardens attached to their houses, but they are neither well cultivated, nor is their produce much varied. The general food of the people is oatmeal and potatoes. Of oatmeal a considerable quantity is imported.

The extent of wood land in Argyshire has been very differently estimated. Dr. Smith (*General View of the Agriculture of Argyle*) gives 30,000 acres for the natural woods: and the plantations of the Duke of Argyle and others are estimated at about 4000 more; to which 2000 acres may be added for the wood of the islands. The scarcity of wood is severely felt in many places. In former ages a great part of the country was covered with it.

The cattle of this district constitute one of the chief articles of export. They are of the west Highland breed, and are reared for the southern market, where they are preferred to almost any others. Being of small size, and of hardy constitution, they can bear to be driven to distant markets, which is an important consideration. Their milk is rich, but small in quantity. In Cantire, the dairy is the chief object of attention; and both butter and cheese are made beyond the wants of the district. The sheep occupy, in many places, the high grounds, where they have been substituted with great advantage for black cattle. They are chiefly of the Linton or black-faced kind, having in a great measure driven out the small white-faced breed, which is supposed to have been the earliest introduced into Scotland, and which many have thought capable of being so far improved as to become a very suitable stock. The horses are of various, but on the whole of inferior, breeds. Since the introduction of sheep, less attention has been paid to rearing them. Swine were formerly few in number, the Highlanders having a prejudice against them; but they are increasing. Goats are few; poultry and pigeons not numerous. In the islands, black cattle are reared more than sheep. From Isla horses are exported to Ireland.

Wild animals are numerous in the rugged districts to the N.E. Roes and red deer are abundant in several parts: also grouse, ptarmigans, and black cocks. The eagle occupies the bare rugged summit of the rocks. Rabbits and a few hares are found in some of the islands.

The manufactures of this county are unimportant. The woollen manufacture was established at Inverary, and carried on for many years under the patronage of the Duke of Argyle, but it does not seem to have flourished, and has been given up for some time. The cotton manufacture has gained but little ground; whatever is carried on is at Campbeltown. A more important branch of industry is the herring, cod, and ling fishery, though these might be prosecuted with greater diligence and spirit. In the years 1819-20, at the two stations, Inverary and Campbeltown, 266 vessels and 798 men were engaged in this branch of industry, besides various workmen as curers, coopers, labourers, &c. who made up the total number of 1220. The quantity of fish on the coast and around the islands is very great, and the herrings of Loch Fyne are well known. The salmon of Loch Awe are remarkably good, and the trout perhaps unrivalled, being of all sizes, up to 20 lbs. weight. The quantity of kelp made on the coast and on the islands was considerable; but the reduction of the duty on foreign barilla has much diminished the demand for it.

Large sums of public money have been applied to making roads in this county, together with other sums raised by county assessments. The main road from the Lowlands enters the county by Glencro and Cairndhu, at the head of Loch Fyne; that from Perthshire, by Dalnally, near the N.E. end of Loch Awe; and that from the north Highlands crosses Loch Leven at Balaclulish, or Balahulish ferry, and Loch Eil at Carron ferry. Two canals, the Caledonian Canal (running through the great valley of Scotland from Murray Frith to Linnhe Loch), and the Crinan Canal (from Loch Crinan to Loch Fyne), belong to Argyshire: the former partially and in a small degree, the latter entirely; but the traffic on these canals, though much increased by the introduction of steam-navigation, is not commensurate with the outlay. Nothing, however, has given a greater impulse to agriculture and industry in Argyshire than the extension of steam-navigation of late years. By means of it, the most distant parts of the county are brought into communication with one another, and with Glasgow, to which they can now send their stock and produce, with the certainty of finding a good market.

Argyleshire contains few towns. Inverary, on Loch Fyne, an Argyle proper (population in 1831, 1117), is the county town, and a royal burgh; Campbeltown, in Cantire (population 4869), is also a royal burgh. [See INVERARY and CAMPBELTOWN.] Oban, perhaps the next place in importance, is on the coast of Lorn, nearly opposite the island of Kerrera. There are no weekly markets in the shire; but eighteen fairs for the sale of horses, cows, coarse cloths, yarn, &c. are held during the year at various places (Smith's *Survey*, &c.) The population of the whole county was, in 1831, 101,400, as already stated. It has increased in the last twenty years, notwithstanding the partial depopulation from the consolidation of smaller holdings into large sheep farms.

The county returns one member to the House of Commons; and the burghs of Inverary, Oban, and Campbeltown, unite with Ayr and Irvine (Ayrshire) to return another.

The chief landed proprietor is the Duke of Argyle, whose domains and influence were formerly such that he could bring 3000 to 4000 men into the field; and the name of Campbell, that of the ducal family, is by far the most prevalent. The marquises of Tweeddale and Breadalbane have also property in the county. The latter is a branch of the Campbell family.

The population returns of 1831 contain the names of fifty parishes in the mainland and isles, but we have no information of the number of benefices. The great extent of some of the parishes has led to the erection of new churches and manse (parsonage houses) by the 'commissioners for building churches in the Highlands of Scotland.' Eleven churches have been built, all except one, with a manse; and three manse erected where churches were previously in existence, or have been built by private individuals. Of these eleven churches, six are in the islands of Mull, Isla, Ulva, and Iona. Argyle gives name to a synod, which has jurisdiction over all the parishes of the county, except one, and over the shire of Bute. In the territory thus subject to the synod there were, in 1811, five presbyteries, and thirty-nine ecclesiastical parishes, with forty-one clergymen: but the number of the latter is now of course much increased. There are some catholics in the islands.

Argyleshire contains many antiquities. The ecclesiastical ruins in Iona will be mentioned in our notice of that island. There are in Oronsa the remains of a Cistercian priory, one of the finest religious antiquities of the Hebrides, after those of Iona. Of ancient castles, may be mentioned Duntaffnage, at the entrance of Loch Etive, a square building in a ruinous state, with round towers at three of the corners, leaving an old chapel of elegant workmanship near it; Ardernish or Ardnornish, on the sound of Mull; Skipnish in Cantire, Kilchurn at the east end of Loch Awe, and others; Inverary castle will be mentioned in the article INVERARY. There are in different places of the coast old Duns or Danish forts. Druidical circles, more or less complete, and cairns, are to be seen in different parts. Of natural curiosities, besides Staffa with its basaltic columns and cave [see STAFFA], may be noticed some singular caverns in the parishes of Loch-Goyle-head and Strachur, both in Cowal.

After undergoing a variety of political changes, we find, in the middle ages, the territory of Argyle subject to thanes, powerful and in fact independent. The lordship of Argyle, with Mull and the islands north of it, were subject to the M'Dougals of Lorn; Isla, Cantire, and the southern lands to the M'Donalds, known by the style of 'Lords of the Isles,' or 'Earls of Ross.' The nominal allegiance of these last to the kings of Scotland was unsteady; but their power was broken in the reign of James III., towards the latter part of the fifteenth century. The acquisition of Lorn by the Stuart family, by marriage, and the erection of a earldom of Argyle in favour of the Campbells of Loch Awe, weakened their sway still further, and produced the annihilation, and at last the annihilation of it. In 1614 the M'Donalds rose in insurrection to oppose the grant of Canrobie to the Earl of Argyle and his relations, but the power of the Campbells prevailed. In 1748 all heritable jurisdictions were abolished by act of parliament, and civilization as subsequently made great advances.

The Gaelic language still predominates in Argyle; but in Inverary, though in the Highlands, English is as much spoken as Gaelic. (Smith's *General View of the Agriculture of Argyle*, 1798; *General Report of Scotland*, drawn

up under the direction of Sir John Sinclair, 1814; *Parliamentary Papers*; Pennant's *Tour in Scotland*, 1774; and *Voyage to the Hebrides*.)

ARGYLE, a subdivision of the county so called. [See ARGYLE, SHIRE OF.]

ARGYLE, DUKES AND MARQUIS OF. [See CAMPBELL.]

ARGYRO (or ARGHIRO) CASTRO, an important town in the inland part of Albania, in European Turkey. It is in the fertile valley or district of Deropol, a name which appears to be sometimes applied to the town itself, and to the river which waters the valley.

Argyro Castro is built upon the declivity of the mountains which enclose the valley on the south-west side, and is not far from the river already mentioned, to which it gives name, and which is a branch of the Vouissa, or Bojessa. [See ALBANIA.] Several deep ravines approach each other at this spot, and the houses crown the summits of the steep and narrow ridges which separate them. Upon three of these ridges the greatest part of the town is placed. The central ridge is surmounted by the castle built by Ali Pasha, which is of great extent, and, with reference to Turkish warfare, strong. The included area of the castle, owing to the form of the ridge on which it stands, is very long and narrow, and the walls, though thick, were built in too great haste. The ground on which it stands is high and steep, but appears to be commanded by some of the neighbouring heights on which parts of the town are situated. Ali erected a seraglio, or palace, within this castle, and there are also a mosque, barracks for 5000 troops, and subterranean magazines of ammunition and provisions. Water is brought to the town generally, and also to the castle, a distance of six miles, by an aqueduct.

The situation of the town renders the streets so steep, that horsemen must dismount in order to proceed with safety, but it gives an air of magnificence to the place, which is increased by the size of some of the Turkish houses. The sides of the chasms, or ravines, are lined with houses intermingled with trees, shrubs, and gardens; but the mountain torrents, which, after the melting of the snows, sweep through these ravines, sometimes occasion fearful devastation.

The houses were estimated, when Dr. Holland visited the town in 1813, at 4000, and the inhabitants at 20,000; which agrees with the estimate of Sir John Hobhouse, who travelled in the country, though he did not visit the town itself, about three years and a half before. Mr. Hughes, who visited Argyro Castro about the same time as Dr. Holland, says, the inhabitants were computed at about 15,000. The trade of the town, which, before its reduction by Ali Pasha, was the principal depot for the internal commerce of the district, appears to have been considerable. M. Balbi states the population very vaguely at 4000 to 9000.

The distance of this town from Joannina is computed at fifty miles by Dr. Holland, and by Mr. Hughes at twenty hours' journey N. W. Mr. Hughes states, that it is not on the site of the ancient town, which had successively the names of Phanote, Hadrianopolis*, or Justinianopolis.

Previous to the winter of 1811-1812, Argyro Castro appears to have enjoyed a considerable degree of independence. The chief power had been divided, as in many towns in Albania, among the principal families. Ali Pasha attacked it in vain, till the time above mentioned. About that period, he contrived to inveigle away the bravest and most warlike of the inhabitants, and seized many of the merchants who were scattered about the country. The chiefs of this and some neighbouring parts assembled their forces to oppose him, but were defeated near Delvino, another Albanian town some miles to the south. Argyro Castro soon afterwards surrendered, and Ali built the fortress noticed above. When he was attacked by the forces of the Grand Seigneur, this strong hold was given up to the Turks by his son Mouctar, who deserted him in his hour of need.

Most of the people of Argyro Castro are Turks or Albanians, who profess the Mohammedan religion. The number of Greek families is very small: they have a bishop, and are remarkable for their courtesy and agreeable manner to strangers. (Hobhouse's, Holland's, and Hughes's *Travels*; Leake's *Researches in Greece*.)

A'RIA, the name of a province of the ancient Persian empire. It formed part of the country of Ariana, or Iran,

* Even this name Deropol seems to be a derivation. See Leake's *Researches*.

and bordered in the north upon the Tapuri, Margiana, and Bactriana, in the east upon the Paropamisadæ, and in the south and west upon Drangiana, Karmania, and Parthia. Its situation corresponds to that of the modern Sejestan and the southern part of Khorasan. Strabo (xi. c. 10) calls Aria and Margiana the best provinces of this part of the earth. They are, he says, watered by the rivers Arios and Margos. The former of these, called also Arias, Arieos, or Arrianos, is described by Arrian (iv. c. 6) as a river not less than the Peneios of Thessalia, yet losing itself in the ground. This account answers to the present Heri-Rud. The Margos is supposed to be the modern Murgh-ab.

The remark of Strabo, that Aria is 2000 stadia in length and 300 in breadth, can be understood only as applying to the principal part of the province, probably the valley of the river Arius, which seems to have been early celebrated for its fertility.

Herodotus does not mention the country of Aria, but he enumerates the Ariei (Ἀριοί) as constituting, together with the Parthi, the Chorasmii, and the Sogdi, the sixteenth of the twenty satrapies into which Darius divided the Persian empire. (Herod. iii. c. 93.) The antient name of the Medi was Ariei (Ἀριοί). (Herod. vii. 62.) Lassen (*Indische Bibliothek*, vol. iii. p. 71) supposes the name of the Ariei to be etymologically identical with the word *Arya*, by which the followers of the Brahmanic religion are designated in Sanscrit.

The importance of Aria, and the advantages which its situation affords to commerce, could not be attested by higher authority than that of Alexander the Great, who here founded a town, named Alexandria Arión (Alexandria of the Ariei). The situation of this town it is difficult to determine, in consequence of the discrepant statements concerning it found in antient authors. Ptolemy (*Geogr.* vi. 17) places Alexandria near the lake Arius, and conformably to this information D'Anville fixed its position at a place now named Corra, on the western side of the lake Zerrah. Pliny (*Hist. Nat.* vi. 23) says, that Alexandria Arión was washed by the river Arius; and if we take this Arius to be the present Heri-Rud, the position of Alexandria will answer that of the present Herat. Besides the popular belief now prevalent in the East, which is in favour of this opinion, it is also supported by Eratosthenes' statement of the distance of Alexandria Arión from Baktra = 3870 stadia, and from the Caspiæ Pylæ = 6400 stadia (Strabo, xi. c. 8), which it would be impossible to reconcile with the assumption that Alexandria was near the lake Zerrah. (See St. Croix, *Examen Critique des Historiens d'Alexandre*, p. 822, &c.) Mannert, who takes the river Arius to be the present Ferrah-Rud, supposes the present village of Pulki, at the south-eastern turn of the river Hirmend, to answer the situation of Alexandria.

The capital of the Ariei, at the time of the Macedonian conquest, was Arctoana: thus the name is written in the best (the Florentine) MS. of Arrian; others have Artacoana; Mannert prefers Artacauan, or Artacabane, from Pliny and Isidor. It must have been situated considerably to the north, as Alexander was able to reach it within two days from his march against Baktra (Arrian, iii. 25). Ptolemy places it at no great distance from Alexandria; and Mannert, assuming the southern position of the latter town, seems inclined to think that the extensive ruins of an antient town, discovered by Christie, at Dushak, near the river Hirmend, are those of Arctoana. [See ARIANA.]

A'RIA, in music (Ital. *air*). [See AIR.]

ARIA'NA is the general appellation given by antient authors, subsequent to the age of Alexander the Great, to the eastern portion of those countries which form the highland of Persia. According to Eratosthenes (quoted by Strabo, p. 723, Casaub.: tom. iii. p. 310. edit. Tauchn.), Ariana was bounded on the north by the Paropamisus mountains and their western continuation as far as the Caspiæ Pylæ; on the south by the Great Sea (the Indian Ocean); on the east by the river Indus, and on the west by the chain of hills which separate Parthylene from Media, and Karmania from Paraitakene and Persis. Its shape is by Strabo (l. c., p. 304, 305) compared to that of a parallelogram, the dimensions of which, reckoned from the mouths of the Indus to the Paropamisus, he estimates at 12,000 or 13,000 stadia; and in a straight line from the upper Indus to the Caspiæ Pylæ, on the authority of Eratosthenes, at 14,000 stadia (Strabo, i. c. 4, tom. i. p. 101, edit. Tauchn.); the length of the southern sea-coast from the mouths of the Indus to the entrance of the Persian Gulf is stated at 12,900 stadia

(Strabo, xv. c. 2, tom. iii. p. 305). The total of the distances on a road from the Caspiæ Pylæ by way of Hekatompylos, Alexandria in Aria, Prophthasia, Arachoti (the town), and Ortospana, to the confines of India, is in one passage of Strabo (xi. c. 8, tom. ii. p. 434, 435) reported, on the authority of Eratosthenes, to be 15,500 stadia, in another passage (xv. c. 2, tom. iii. p. 310), on the same authority, only 15,300: the latter appears more correct, as it approaches nearer to the sum of the single distances enumerated which amounts to no more than 15,210 stadia.

Strabo observes (p. 724: t. iii. p. 311), that the name Ariana is sometimes used so as to extend beyond the limits above assigned to it, and to comprehend part of the Persæ and Medi, and, towards the north, part of the Bactri and Sogdiani; 'for these,' says he, 'have very nearly the same language (as that spoken in Ariana).'

The countries properly belonging to Ariana are, according to Strabo, in the east, the Paropamisadæ, the Arachoti, and Gedroseni along the Indus, proceeding from north to south; the Drangæ towards the west of the Arachoti and Gedroseni; the Ariei towards the west of the Paropamisadæ, but extending considerably to the west and south, so as nearly to encompass the Drangæ; the Parthyæi west of the Ariei, towards the Caspiæ Pylæ; and Karmania to the south of the Parthyæi. It is observed by Mannert, *Geographie der Griechen und Römer*, vol. v. part ii. p. 3, 4, that antient authors sometimes confound Ariana with Aria, saying of the province what can only be understood as applying to the entire country.

The original form of the name Ariana in the Zend or antient Persian language is *Airyâne*. From this seems to be derived the modern Persian name Iran, by which oriental writers designate the country between the Tigris, the Persian Gulf, the Oxus or Gihon, and the Indus. M. Eugène Burnouf (*Commentaire sur le Yaçna*, vol. i. notes, p. 62) thinks that, in some passages of the Zend-Avesta, the word *Arya*, properly the name of the province Aria, must be taken as synonymous with *Airyâne* or Ariana. He observes that the countries not belonging to *Airyâne* are, in the Zend-Avesta, called *Anairyão Danhâvô* (pronounce Dang-hâvô) i. e. Non-Arian provinces: a name regularly formed from *Arya* by means of the prefixed negative *a* (*an*), which is also used in Greek and Sanscrit. An expression of analogous form and import had long since been read by De Sacy (*Mémoires sur diverses Antiquités de la Perse*, p. 54, &c.) in one of the Greek inscriptions of Nakshi Rostam copied by Niebuhr, where the Sassanide king, Sapor, son of Ardeshir, is called the king of the Arians and Non-Arians (APIANQN KAI ANAPIANQN).

ARIA'NO, a town in the province of Principato Ultra in the kingdom of Naples, and a bishop's see. It is situated on a very steep hill on the main road from Naples to Puglia, and in the highest point of the pass leading over the Apennine ridge into the plains of the latter country. From Ariano the road descends rapidly, following the course of the Cervaro, here a mountain stream, which flows eastwards, and enters the flats of Puglia a little beyond Ponte di Bovino. Ariano is forty-four miles E.N.E. of Naples, and thirty-two miles S.W. of the town of Foggia, in 41° 8' N. lat. and 15° 1' E. long. The road distance from Naples to Foggia, through Ariano, is about ninety English miles. It was built by the Greek governors of Apulia under the lower empire, as well as the neighbouring town of Troja, and was reckoned important during the subsequent vicissitudes of the country on account of its situation, which enabled it to command the pass from the eastern into the western provinces. It was made a feudal county by the Normans. Ruggiero I., king of Sicily and Duke of Apulia, held at Ariano a parliament of the barons of the kingdom in 1140, in which he fixed the new coin of the realm. Ariano had a castle, which was considered strong in those times, and was repeatedly taken and retaken during the wars of the Norman, Suabian, Angevin, and Aragonese dynasties. In the reign of Joanna II. the famous Sforza Attendolo bore the title of Count of Ariano. The fief subsequently reverted to the crown, and Ariano became a royal town. It has long since declined from its former importance. It has suffered greatly from earthquakes, especially from that of 1732. Its population in the last century amounted to 14,000, but is now under 10,000. A recent visitor informs us that the population now can hardly exceed 7000.

Close to Ariano, and between that town and the head of the valley of Bovino, there is a village occupied by an Al-

banian colony, a remarkably handsome race. They retain the use of their own language among themselves, but they can also speak that of the country. (Vitale, *Storia della Città d'Ariano*.)

ARIANS, a name applied in common to all who entertain opinions concerning the relation between Jesus Christ and the Father similar to those entertained by Arius, although they have not always derived their notions from him. According to the second oration of Athanasius against the Arians (§ 24), Eusebius of Nicomedia, Asterius, and Arius, agreed in the following opinion: God being willing to create the universe, and seeing that it could not be subject to the working of his almighty hand, made first a single being whom he called Son, or Logos, to be a link between God and the world, by whom the whole universe was created. (Compare Athanas. *c. Arian*. i. § 5.) The Arians formed a more exalted idea of Christ than the Socinians and the modern Neologians, or Rationalists, in Germany. According to the Rationalists, Jesus was a sort of Socrates among the Jews, and Socrates was a Grecian Jesus. But the Arians did not deny that Christ, in the New Testament, was called God, and they ascribed to him a sort of divine dignity; but asserted that he had this dignity, not by his own essence, but merely by the grace of God the Father. (Athanas. *Orat. c. Arian*. i. § 6.) The Arians fully admitted the incomprehensibility of God, and that Christians ought to pay divine worship to Jesus Christ. This they proved from Christ's saying, 'That all men should honour the Son, even as they honour the Father. He that honoureth not the Son, honoureth not the Father who hath sent him.' (St. John, v. 23.) Hence the Arians were accused by Athanasius of idolatry, because, according to their own notions, they offered to a creature that tribute which belonged to the Creator alone. The Arians distinguished the Logos in God from the Logos improperly so called.

These were the characteristic doctrines of the strict Arians. But in the western part of the Roman empire, all adversaries of the doctrine of Athanasius, that the Son was *homousios*, or of the same essence with the Father, were called Arians; although some of these opponents taught a doctrine which had already been propagated in the school of Origen, namely, that the Son was *homoiousios*, or of similar essence. These, afterwards called semi-Arians, were first compelled, by the opposition of the Homousiasts, to join the Arians, but, owing to the persecutions which they suffered from the strict Arians (who asserted the Son to be *ἀνόμοιος κατ' οὐσίαν*, dissimilar in essence), they were driven back into the orthodox church. The party of Aëtius, and of his pupil, Eunomius, went a step farther than Arius, by asserting the comprehensibility of the divine essence, and by considering the *precision of doctrine* (*δογματικὴν ἀκρίβειαν*) of chief importance in Christianity. The Antiochene church, under the Arian bishop Eudoxius, afforded an asylum to the ultra-Arian followers of Eunomius. The difference between Arians and semi-Arians became more evident from these extreme opinions, and contributed to the gradual assimilation of the latter to the orthodox church. This assimilation was easily effected, because the semi-Arians had constantly used an orthodox phraseology, which was taken by the people in an orthodox sense. According to Hilarius Pictaviensis *contra Aurentium* (§ 6), the ears of the people were holier than the hearts of their priests. At Constantinople, however, a dogmatizing spirit pervaded all ranks of society. Of this we have a graphic description in the *Oratio de Deitate Filii et Spiritus Sancti*, by Gregorius of Nyssa (Opp. t. iii. p. 466). 'The town is full of those who dogmatize concerning incomprehensible matters,—they are in the streets and markets, among the clothiers, money-changers, and victuallers. If you ask any one how much you have to pay, they dogmatize about being begotten and not being begotten. If you ask the price of bread, the reply is, "The Father is greater than the Son, and the Son is subordinate to the Father." If you ask, "Is the bath ready?" the answer is, "The Son is created from nothing." (Compare Neander's *Kirchengeschichte*, b. ii. pp. 767-904.) [See ARIUS, ATHANASIUS, EUNOMIUS, GREGORIUS of Nazianzus, GREGORIUS of Nyssa, BASILIUS.]

ARIARATHES. [See CAPPAODOCIA.]

A'RIAS MONTANUS (BENEDICTUS), in Spanish BENITO ARIAS MONTANO, was a celebrated catholic divine and orientalist, who possessed vast erudition in Jewish antiquities, and chiefly distinguished himself as editor and interpreter of the sacred Scriptures. He was born, in 1527,

of noble, but poor parents, in a village called Frexenal de la Sierra, which is situated in the province of Estremadura, near the Andalusian border, in a mountainous district; and hence his surname Montano. He also used to style himself Hispalensis, because at Sevilla (Hispalis) he laid the foundation of his future eminence as a scholar. During his stay at Sevilla he was supported by the magistrates of the city and other kind patrons: subsequently he took up his residence at Alcalá de Henares (Complutum), and there obtained the degree of Doctor of Divinity. He specially devoted himself to the study of Scripture in the original languages, and in general to that circle of philosophy which is connected with these tongues. He acquired a knowledge of the Arabic, the Syriac, and the Chaldaic, which, for that age, was truly surprising: at a later period, while journeying through France, England, Italy, Germany, and the Netherlands, he acquired the knowledge of several modern tongues. He himself, as well as several of his contemporaries, seems to have considered it a wonderful accomplishment, as no doubt it was in that age, to know ten languages. On account of his great scholarship, the bishop of Segovia, Martin Perez Ayala, took him for his companion to the Council of Trent, where he had his share in some of the most important transactions. After his return to his own country he determined to live in seclusion and devote his time to literature, and for this purpose chose a small place in the mountains of Andalusia, near Aracena, as his residence. But he made no long stay in this retreat, being invited by Philip II. to superintend the splendid and expensive edition of the *Polyglott Bible*, which, at the suggestion of a most diligent and enlightened printer, Christopher Plantin, was to be executed at Antwerp. Arias accordingly set out for Antwerp, in 1568, provided with the most honourable recommendations to the governor of the Netherlands, the Duke Ferdinand of Alba, so disadvantageously known for his cruelty and tyrannical administration. Arias devoted four years to this undertaking, and had the pleasure of presenting the finished work to Pope Gregory XIII. in 1572. During his sojourn in the Netherlands, he was also president of the committee, which, by the Duke of Alba's order, prepared the *Index Expurgatorius*. The edition of the Polyglott Bible which Arias gave to the world, in every respect justified the high expectation which had been formed of it; but in an unfortunate voyage from the Netherlands to Spain nearly all the copies were lost. The king, however, remunerated Arias's labours very splendidly, giving him a yearly pension of two thousand ducats, besides other honorary rewards and lucrative offices. Arias was an upright, sincerely orthodox catholic, but he was a declared enemy of the Jesuits, and that ambitious order omitted no opportunity to take revenge on so dangerous a foe—the more powerful, because his orthodoxy had never been questioned, and was supported by uncommon erudition. His *Antwerp Polyglott* had received the approbation and praise of the pope, and even that of the most eminent catholic universities; yet because he had edited the Chaldaic paraphrase in the Polyglott, and expressed certain opinions in his commentaries, he was accused of a leaning towards Judaism, and, in fact, of heresy in general. He was even in danger of falling into the hands of the Inquisition, and was obliged several times to go to Rome in order to defend himself. Having cleared himself of these accusations, he devoted the remaining years of his life to literature, sometimes residing at Sevilla, sometimes at Aracena; he died at Sevilla, in the year 1598, as prior of the convent of St. Iago, being then seventy-one years of age. His library, which was extensive, was incorporated in that of the Escorial, where, Schröckh says, some of his MSS. are still to be found. In respect to moral character, he enjoyed a high reputation for candour and blameless integrity.

Among Arias's numerous and extensive literary works, which chiefly belong to theological, but partly also to classical literature, his Polyglott certainly holds the principal place: it is generally called the *Antwerp Polyglott*, or, from the patronage bestowed on it by Philip II., *Biblia Regia* (the Royal Bible), and sometimes also after the printer, *Biblia Plantiniana*: a fuller notice respecting this great work, in eight folio volumes, will be found in the articles **BIBLE** and **POLYGLOTTS**.

Of Arias's other works the following are the most remarkable:

1. *Antiquitates Judaicae*. Lugd. Batav., 1593, quarto.
2. *Liber Generationis et Regenerationis Adam*, s. de His-

toris Generis Humani, operis magni pars prima, i.e. Anima. Antv., 1573, quarto. This is only a part of a Biblical Encyclopedia which Arias intended to write: another part of this work appeared after his death under the following title: 3. *Naturæ Historia, prima in magni operis corpore pars, Benedicto Aria Montano Descriptore.* Antv., 1601, quarto. 4. *Hymni et Sæcula.* Antv., 1593, 16mo. (being a translation of the Psalms of David and the Ecclesiastes). 5. *Monumenta Humanæ Salutis.* Antv., 1571, quarto. 6. *Speculum Vitæ et Passionis Christi.* Antv., 1573, octavo. 7. *David, Virtutis Exercitationibus probatum a Deo Spectaculum.* Francf., 1597, quarto. 8. *Dictatum Christianum, sive Aureus de Christi Vita et Doctrina Libellus.* Antv., 1775, octavo. 9. *Aforismos sacados de la Historia de P. Cornelio Tacito, i.e. Aphorisms collected from Tacitus's History.* Barcelona, 1614, octavo.

He wrote, about the year 1569, an hexameter poem on rhetoric in four books; and he also edited the *Tour of the Jew Benjamin of Tudela.*

Sources for the biography of Arias Montanus are:

Nicolas Antonio, *Bibliotheca Hispanica*, tom. i. p. 162—164. Nicoron, *Mémoires*, &c., à l'Histoire des Hommes illustres, tom. xxviii., p. 104—118. J. Matth. Schröckh's *Lebensbeschreibungen berühmter Gelehrten*, one volume, p. 291—304 in the Leips. edit. of 1790;—and Moreri's *Dictionary*, article *Arias*, where the Spanish translation of this great work is, as might be expected in the biography of a Spaniard, preferable to the French original.

ARICA, a district in the department of Arequipa, and the republic of Peru. The valley, which extends about eighteen miles from the coast into the lower chain of the Andes, is irrigated by a small stream of good clear water, about half a mile on each side of which the soil is fertile and the aspect verdant, but beyond this, as far as the eye can reach, is a complete desert of sand to the foot of the mountains, except a small space around the town. The valley is famous for Guinea pepper, which is principally cultivated with manure of 'guano,' or cormorants' dung, a singular but considerable branch of commerce, ten or twelve small vessels being employed in collecting it from the small islands along the coast. Cotton, olives, and castor-oil are produced; fruit and vegetables are plentiful; and oxen and sheep may be procured; *aguardiente* (spirits) and a small white wine are manufactured, and rock salt is dug out of the adjacent mountains. The people of the valley are subject to a sort of ague called *terteaga*, and the district is generally unhealthy; the heat is excessive by day, but the nights are very chilly.

Close to the beach, in a small bay formed by a projecting bluff, stands the town of Arica, once flourishing and populous; it was sacked by Sir Francis Drake in 1579, and, in common with other places in Peru, has suffered much from earthquakes, more particularly in November, 1608. It appears, however, successfully to have resisted the attacks of the Buccaneers, who twice attempted to reduce it. During the war of independence it was entirely desolated. It now consists of a few huts, the better sort built of sun-dried bricks, and plastered with mud, but mostly formed of canes or reeds set upright and bound together; these being only covered in with matting, the place appears at a little distance to be a heap of ruins. There is a custom-house, a convent of Franciscan friars, also one of the order of San Juan de Dios, and a parish church dedicated to St. Mark. The population does not exceed 400, the greater part of whom are Indians. The town is defended by two small forts of six guns each, and garrisoned by about fifty soldiers; it belongs to the see of Arequipa.

The bay is small, and safe, principally from the rare occurrence of storms; ships lie close to the shore in deep water; it is exposed to southerly and westerly winds, which seldom blow strong; but in winter time the north winds are violent. In the summer time the land and sea-breezes are very regular. There are no regular tides, but a rise and fall of about three feet, occasioned by the winds. The surf rolls so heavy on the beach, that ships' boats cannot land, and the only means of shipping or landing cargoes is on a *balsa*, a float formed of two inflated seals' skins fastened together, and in this manner bars of silver, bags of gold and silver, and all goods, are conveyed to vessels in the bay.

Arica is the sea-port of Tacna, distant thirty miles to the N.N.E.; most of the silver from the mines of Potosi was formerly shipped off hence to Lima, and much bullion is still exported.

Near the small bay of Chacota, south of Arica, a number of sepulchres of the antient Peruvian inhabitants have been discovered, whence the bodies have been dug in a very perfect state, but almost reduced to skeletons, covered with a tough, dark, brown skin. Latitude of the town $18^{\circ} 28' S.$, longitude $70^{\circ} 13' W.$ Distant 185 leagues S.E. of Lima. (Basil Hall; *Orig. MS.* of Captain Bansa, Spanish navy.)

ARIES (constellation), the Ram, is the first constellation of the antient zodiac. The sign of the zodiac, so called, including the first thirty degrees of the ecliptic, reckoning from the vernal equinox, owing to the precession of the equinoxes, now begins in the constellation Pisces.

The Greek mythology makes Arics to be the commemoration of the golden fleece, in quest of which the Argonautic expedition was undertaken. [See ARGONAUTS.] Owing to the difficulty of separating any account of discussions relating to the origin of this constellation in particular, from the general description of the ZODIAC, we refer to the latter term for further mythological elucidation.

This constellation is surrounded by Cetus, Taurus, Perseus, Andromeda, and Pisces, the first of which is directly below it. In the horns are two stars, α and β , the only two of any note, which are near together, and may be found by continuing the line drawn from Procyon through Aldebaran; or, by continuing the line drawn through the pole star, and γ Cassiopeiæ, the nearest to the Great Bear of the five. These stars (α and β Arietis) are on the meridian at midnight in the middle of October.

The principal stars are as follows. As before, a number without brackets is that of Flamsteed; in () that of Piazzi; in [] that of Bradley.

ARIES, in antient military science, is the Latin name for the BATTERING RAM.

ARIETTA, in music (the diminutive of the Italian word *aria*), a short air.

ARILLUS, in botany, is a fleshy expansion either of the umbilical cord by which seeds are attached to the placenta, or of the placenta itself. It is never formed till after the fertilization of the seed, and is only met with in a few plants; its use is entirely unknown. The most remarkable instance of the arillus among species of common occurrence is in the spindle tree, *Euonymus Europæus*, in which it is the fleshy red covering of the seed that renders that plant so ornamental in the autumn and beginning of winter. Another familiar case is the *mace* of the nutmeg; this substance is, when fresh, a crimson lacerated covering of the nut, which acquires its pale brown colour in consequence of the preparation it undergoes in being dried and prepared for market. Before the term was thus accurately defined, it was applied to a variety of parts of exceedingly different natures.

ARIMANES and AREIMANIOS are Greek corrup-

tions of the Persian name *Ahriman* or *Aberiman*, which, according to the ancient doctrine of Zoroaster, is the appellation of the author of evil, and the opponent of *Ormuzd*, who is the author of good. The genuine form of the word, as it occurs in the original text of the *Zend-Avesta*, is *Anro-Mainyus* (pronounce *Angro-Mainyus*), a compound term, the meaning of which might be expressed by perhaps an etymological equivalent in the Greek *ἀνδρομενής*, 'hostile, of evil disposition.' The *Zend* original of the word *Ormuzd* is *Ahuro-Mazdāo*, coming near the forms *Oromazes* and *Oromasdes*, under which the name occurs in Greek authors (e.g., *Plutarch, de Iside et Osir.* p. 660. ed. Steph.) In the Sanscrit paraphrase of a portion of the *Zend-Avesta* by *Neriosengh*, the name *Ahuro-Mazdāo* is interpreted 'the king of great wisdom.' This interpretation is adopted by *M. Eugène Burnouf, Commentaire sur le Yaçna*, vol. i. p. 72, &c.

The two individual beings *Ormuzd* and *Ahriman* were, according to the *Zend-Avesta*, the offspring of *Zeruan-Akerene*, the indefinite and impersonal divine substance and cause of all existence. Both were primarily equal in intellect and power; but *Ormuzd* was, from the beginning, pure, good, and luminous; while *Ahriman* was dark and wicked, and bent on destruction and mischief. *Ormuzd* is represented as the creator of the world: *Ahriman* constantly counteracts the designs of his goodness. *Ormuzd* created the six *Amshaspands*, or ministering angels of good: *Ahriman*, in opposition, created the six *Darjus* to be subservient to his evil purposes. 'I produced,' says *Ormuzd*, 'a place of delight, *Airyāne-Vaejo*, fairer than the entire existing world. I acted first; then this evil one acted, whose soul is not mortal. The first place similar to paradise which I made, I who am *Ormuzd*, was *Airyāne-Vaejo*, created pure. Then this *Paityare-Ahriman*, full of death, produced in the river (which watered that country) the great snake of winter,' &c. (*Anquetil du Perron's Zend-Avesta*, vol. i. part 2, page 263, &c.) Thus *Ormuzd* is always taking the lead by pure and good productions, and *Ahriman* follows, sowing the seeds of natural and moral evil in the new creations. The struggle of the two deities will, according to the doctrine of Zoroaster, continue during 12,000 years, after the lapse of which *Ormuzd* will defeat his opponent. *Ahriman* himself will then become a convert to truth and goodness, and a new world, happier and better than the present, will be created.

We abstain from entering into further detail concerning the dogma of the contest between *Ormuzd* and *Ahriman*, as the original documents in the *Zend* language, from which alone authentic information on the subject can be derived, have but just begun to be critically examined, and much is still wanted to a full understanding of them. The translation by *Anquetil du Perron*, though of invaluable service to those who wish to follow up the inquiry, has been found too loose, and in some instances too incorrect to allow inferences on many subtle points of the ancient Persian faith to be drawn from it.

The Persian doctrine of the two opposite principles was known to *Aristotle*, who, according to *Diogenes Laertius (De Vit. Philos. Proœm.* 2), distinguished them as *ἀγαθός* *δαίμων* and *κακός* *δαίμων*.

The most ancient foreign authors that have given some interesting details regarding the doctrine of Zoroaster are the Armenian chroniclers of the fifth century, especially *Elisæus* and *Esnac*. See *Elisæus's History of Vartan*, &c., translated by *C. F. Neumann*, London, 1830, 4to., and an extract from the *Chronicle of Esnac*, in the appendix to *P. Aucher's Grammar, Armenian and English*, Venice, 1819, 8vo. p. 198, &c.

ARINS (or **ARINNES**), are the remains of a Siberian people who inhabit the banks of the *Yenisei*. They have been reduced to their present limited numbers by the successive cruelties of the *Tartars*, by consequent emigration to the regions inhabited by the *Kirgishes*, and by intermarriage with the *Catchin-Tartars* and *Otiaks*. They reside in an *aimak* or single district, under the superintendence of a *bachlik* or elder, by whom the tribute, fixed by the Russian government in 1733, is regularly paid. When *Müller*, the traveller, visited the spot, he found but one single individual amongst them who was capable of speaking the native dialect, which has some affinity to the *Otiak*; the rest of his brethren had adopted the *Catchin-Tartar* tongue.

ARIOBARZANES. [See **CAPPADOCIA**.]

ARI'ON, a native of *Lesbos*, the inventor of the dithy-

rambus, and a great musician, was contemporary with *Periander* of *Corinth*, and with *Alyattes*, king of *Lydia* (B.C. 628—571). He travelled as far as *Taras* (*Taranto*) in *Southern Italy*, and acquired considerable wealth by his professional skill. (See his history, *Herod.* i. 23; and also *Alian. Hist. Anim.* xii. 45.)

ARIO'SO, in music (an Italian adjective, *airy*), used adverbially—in the manner of an air, as contradistinguished from recitative. When applied to instrumental music, it denotes a sustained, a vocal style. It is sometimes most improperly used substantively, and may be mentioned among the numerous instances of the misapplication of Italian words by English and German musicians.

ARIOSTO, LODOVICO, was born at *Reggio*, near *Modena*, September 8, 1474. He was the son of *Niccolò Ariosto* of *Ferrara*, a military officer in the service of *Duke Hercules I. d'Este*, and governor of the citadel of *Reggio*; his mother, *Daria Malaguzzi*, was of a noble family of *Reggio*. *Lodovico* was the eldest born of a family of five brothers and five sisters. He early showed a disposition for poetry, and wrote in his boyhood a drama on the subject of *Pyramus* and *Thisbe*, which he and his brothers rehearsed before their parents. *Lodovico*, being designed for the profession of the law, was sent to *Padua*, where he spent five years, much against his will, in the study of that science; and his father, at last convinced of his distaste for this pursuit, recalled him home and allowed him to follow his own inclination. *Lodovico* was then past twenty, and being

[From a bronze Italian medal in the British Museum.]

yet but little acquainted with the ancient writers, he put himself under the tuition of *Gregorio da Spoleti*, a learned scholar of the time, by whose assistance he made great progress in *Latin*. He was proceeding to study *Greek* when his teacher was called away to *Milan* to be preceptor to the young *Duke Sforza*. *Ariosto*, however, studied *Greek* later in life. On the death of his father, about the year 1500, he found himself charged with the guardianship of his younger brothers and sisters, and the management of a very moderate patrimony—a task which he entered on with brotherly affection, and which he fulfilled with integrity. In the midst of these cares he found time to write several lyric compositions, both in *Italian* and in *Latin*, by which he attracted the notice of *Cardinal Ippolito d'Este*, younger son of *Hercules I.*, and brother to *Alfonso*, the heir to the ducal crown. The cardinal, in 1503, appointed *Ariosto* one of the gentlemen of his retinue, and soon discovering that his abilities were not confined to poetry, he employed him in important affairs and missions both for himself and for his brother *Alfonso*, after the latter became *Duke of Ferrara*, by the death of his father in 1505. *Alfonso* having joined, in 1509, the famous league of *Cambray* against the Venetian republic, *Cardinal Ippolito* took the command of his brother's troops, and *Ariosto* was present at the campaign of that year on the banks of the lower *Po*, the atrocities of which, perpetrated chiefly by the Slavonian mercenaries in the service of *Venice*, he feelingly describes at the beginning of the thirty-sixth canto of his great poem. In December of the same year, he was sent by the duke on a mission to *Rome* to request the assistance of *Julius II.* against the *Venetians*, but the pope, who had been the first mover in the league, had already changed his mind and become jealous of his French and German allies. *Cardinal Ippolito*, however, in the meantime defeated the *Venetians* and destroyed their flotilla on the *Po*, and the object of *Ariosto's* mission of course ceased.

The following year, 1510, *Pope Julius*, having openly

joined the Venetians against his former allies, excommunicated the Duke of Ferrara for refusing to follow his example, and assembled an army in the Romagna to attack Alfonso's territories. Ariosto was now sent again to deprecate the wrath of the pontiff; but not succeeding, he was obliged to make a hasty escape from Rome, as the pope had threatened to have him thrown into the Tiber, a threat which he was not unlikely to have carried into effect. The war continued, between the Duke of Ferrara and the French on one side, and the Venetians, the pope, and the Swiss on the other, till the death of Julius, in the beginning of 1513, delivered Alfonso from his bitterest enemy. Cardinal Giovanni de' Medici being raised to the pontifical throne, by the name of Leo X., Ariosto went to Rome, to congratulate the new pope, whom he had familiarly known at Florence and at Urbino. Leo received him most graciously. 'He stooped from his pontifical chair, took him by the hand, and saluted him on both cheeks' (Ariosto, *Satira* iv). Ariosto thought his fortune made; but he had not enough of courtly patience and perseverance. He soon grew tired of waiting for more substantial demonstrations of favour, left Rome in disgust, and returned to Ferrara to resume his studies. He had long before this begun a poem, in *ottava rima*, on the fabulous adventures of the knights and paladins, Moors and Christians, of Charlemagne's age, an inexhaustible theme, which had occupied the pens of many Spanish, French, and Italian ballad and romance writers.

In Italy, Pulci, Bojardo, and Bello had each written a poem on the wars between Charlemagne and the Saracens, which tradition had confounded with the previous wars of Charles Martel and Pepin, and in which Orlando, or Roland, appeared as a prominent character, and the champion of the Christians. Bojardo took Orlando for the hero of his poem, and made him fall in love with Angelica, an infidel princess, of exquisite beauty and of consummate coquetry, who had come all the way from Asia for the purpose of sowing dissension among the Christian knights. Bojardo introduced numerous episodes into his narrative, in the midst of which he broke off the story of Angelica, in the fiftieth canto of his *Orlando Innamorato*, and never resumed it, although he had carried his poem to the sixty-ninth canto at the time of his death. Ariosto took up the thread of Angelica's story where Bojardo had left it, and making the jilt fall in love herself with Medoro, an obscure youthful squire, he represents Orlando as driven mad by jealousy and indignation: he continues in this state during the greater part of the poem, committing a thousand absurdities, until he is restored to reason by Astolfo, who brings back his wits in a phial from the moon. Orlando's madness, however, is rather terrific and lamentable than ludicrous; for the poet, often jovial and humorous in his episodes, never loses sight of the dignity of his narrative, nor descends to the low burlesque. But the madness of Orlando is not the principal subject of the poem, although it has furnished the name for it; the war between Charlemagne and the Saracens is continued throughout the narrative, of which it forms a most important and consecutive action, ending with the expulsion of the Moors from France, and the subsequent death of their king Agramante and their other chiefs. The poet has interwoven with these a third subject, which some critics, who are determined to find a unity of action in a poem which is not an epic, have assumed to be the principal one, namely, the loves of Rugiero, a young Saracen knight born of Christian parents, and Bradamante, a Christian amazon, and Rinaldo's sister. These two characters had been already introduced by Bojardo in his *Innamorato*, and Ariosto followed up the story of their mutual attachment; after numerous adventures, crosses, and narrow escapes, he makes them marry in the last or forty-sixth canto of the poem, and from their union he derives the genealogy of the house of Este.

Intermixed with these three subjects or tales are numerous and some long episodes of knights and damsels, of their fights and loves, of their strange adventures, some heroic, some ludicrous, and others pathetic; there are magicians and giants, enchanted palaces and gardens, flying norses and harpies, and other monsters; and the reader finds himself in the midst of a new world, created as it were by the wand of an enchanter. The poet has the art of sketching and particularizing every creature of his fancy with features and attributes so apparently appropriate and consistent with their supposed nature as to remove the feeling of

their improbability. He appears himself deeply interested in his fantastic creation, and at times so entangled in his own labyrinth, that he loses himself, as he ingenuously confesses, and is obliged to break off in the midst of a most interesting story, to run after some other personages, whom he left in a desert island, or on a dangerous voyage, or on the eve of a mortal combat, and to bring them again to the view of his readers. Yet he contrives to wind off all his threads at last with admirable skill. It is not always an easy thing to follow such a guide; but we wander along from tale to tale, from description to description, delighted with the present, and unconscious of the ultimate object of our journey. Such is the *Orlando Furioso* (as far as an idea of it can be given in a few words), the first of all the poems of chivalry and romance. A knowledge of Bojardo's *Innamorato* is, however, required for the proper understanding of the *Furioso*. In both poems there are licentious passages, which render them unfit for the perusal of youth.

Ariosto, after spending ten years in writing his poem, published it in one volume quarto, at Ferrara, in April, 1516, in forty cantos, which he afterwards increased to forty-six. He sold 100 copies of it to the bookseller Gigli of Ferrara, for 28 scudi; about 15 pence per copy. He dedicated it to Cardinal Ippolito, who, after perusing it, is said to have asked 'where he had picked up so many absurdities?' Whether this be true or not, it is certain that Ariosto gained no favour with his patron by his work, in which he had introduced his praises and those of his family in so many places. But the Cardinal had no taste for poetry; he was a busy man of the world, and he told Ariosto that 'he would have felt better satisfied if, instead of praising him in idle verse, he had been more assiduous in his service.' (Ariosto, *Satira* ii.)

In 1517, the Cardinal, being about to set off for Gran in Hungary, of which he was archbishop, asked Ariosto to follow him there, but the poet excused himself on the plea of his health, which was very delicate. His brother Alessandro, however, accompanied the Cardinal. The consequence of Ariosto's refusal was, that his patron was offended, and some time after his departure a small pension which he had allowed him was stopped. After the Cardinal's death, in 1520, Ariosto was called by the Duke Alfonso to his own service, in which he always experienced the kindest treatment. It ought to be observed, in justice to Cardinal d'Este, that, although he showed no sympathy for the poetical merits of Ariosto, it was he, nevertheless, who first patronised and brought him into notice, and introduced him to his brother, to the Medici, and other great men of his time; and that, had it not been for Cardinal Ippolito, Ariosto probably would not have had the leisure, the spirit, or the means of writing and printing his poem, at a time when the patronage of the great was a necessary encouragement to an author. The trifling pension of twenty-five scudi every four months, which Ariosto mentions as being stopped, was not the only remuneration which he had from the Cardinal: through his interest he enjoyed certain ecclesiastical perquisites, such as one-third of the profits of the archiepiscopal chancellor of Milan (about 100 scudi yearly), although he was not ordained priest nor even subdeacon, but had only taken the minor orders which are not attended by binding vows, and wore the clerical dress. (Ariosto, *Satira* ii. and iii., and also Mazzuchelli, *Scrittori d'Italia*, Biography of Ariosto.) Ariosto had also the reversion of the rectorship of Sant' Agata, in Romagna, the incumbent, an old maternal relative, having made it over to him. We ought not to judge of Ariosto's permanent feelings towards his patrons from the fits of poetical querulousness in which he occasionally indulges in his satires, for in the very midst of them we can perceive much grateful regard and affection for both the Cardinal and the Duke. The Duke indeed, by Ariosto's own acknowledgment, behaved liberally to him. Through his munificence the poet was enabled to build himself a house surrounded by a pleasant garden, opposite the church of S. Benedetto, at Ferrara. In February, 1521, Ariosto published a second edition of his poems with many corrections, but still in forty cantos only; this edition is now extremely rare, even more so than the first.

In 1522, having applied to the Duke for some more active and lucrative employment, he was sent as governor to the mountain district of Garfagnana, a dependency of Modena, situated on the western slope of the Apennines, and bordering upon Lucca. This country had just returned to the allegiance of the House of Este, after having been occupied by the Pope and the Florentines. The people

were restless and quarrelsome, and the mountains were infested with outlaws. Ariosto humorously describes the troubles of his government in his fifth Satire. He remained nearly three years at Castelnovo, the chief town of the district, during which he seems to have conciliated the minds of that rude population, and to have restored order among them. Being once stopped in the mountains by a band of robbers, his name and reputation proved his protection; the outlaws, on learning who he was, showed him much respect, and offered to escort him wherever he chose. In 1523 the Duke proposed to send him as ambassador to Clement VII., who had just been elected Pope; but Ariosto declined the mission, having been disappointed with Rome and the Medici once before (*Satira* vii). In 1524, he returned from his government to Ferrara, where it appears he remained ever after, nominally in the Duke's service, but enjoying leisure for his studies. He now wrote his comedies, which were performed with great splendour before the court, in a theatre which the Duke built for the purpose. In October, 1532, Ariosto, after correcting and revising his poem for sixteen years, published the third edition in forty-six cantos, which, in spite of some misprints of which Ariosto bitterly complains, remains the legitimate text of the *Orlando Furioso*. The six entire cantos which he added, are the 33rd, 37th, 39th, 42nd, 44th, and 45th, besides several stanzas here and there added to the other cantos. Some stanzas he wrote in twenty different ways before he fixed upon the present text. The apparent ease of Ariosto's verse is the result of much labour. Scarcely had Ariosto completed his third edition, when he found himself grievously ill with a painful internal complaint, which brought on a decline, and at last, death. It was remarked, that on the night preceding the last day of the year, on which his illness first assumed a serious character, a fire broke out in a wing of the ducal palace, and burnt the great hall and the theatre which had been constructed for the performance of his plays. After lingering several months, Ariosto died on the 6th of June, 1533, in his 59th year. He was buried without any pomp in the old church of San Benedetto, attended by the monks, who volunteered to do honour to his remains. Forty years later, after the church had been rebuilt, Agostino Mosti, of Ferrara, who had studied in his youth under Ariosto, raised a handsome monument to him in the chapel, which is to the right of the great altar, to which spot the poet's bones were transferred with great solemnity. In 1612, Lodovico Ariosto, grand nephew of the poet, raised another monument to his memory more magnificent than the first, in the other chapel to the left of the great altar, to which place Ariosto's remains were finally removed.

Besides the three Ferrara editions above-mentioned, printed under Ariosto's superintendence, several reprints of his poem were published in various parts of Italy in his lifetime. Numerous editions followed after his death; all, however, more or less incorrect, and some of them purposely altered and mutilated. The Aldine edition, of 1545, is one of the best of that age; it is also the first that contains five additional cantos, which are the beginning of a new poem, and were left in MSS. by the author, and delivered by his son Virginio to Antonio Manuzio. G. A. Barotti edited all Ariosto's works, Venice, 1766, six volumes, duodecimo, with many corrections and illustrations, and a life of the poet. Baskerville's edition, 1773, four volumes, octavo, with plates by Bartolozzi, is also much esteemed. The edition of the *Classici Italiani*, five volumes octavo, Milano, 1812-14, is valuable for the *varianti* added to every canto, which the editor Reina has taken from the first two editions of 1516 and 1521. But the best modern edition of the *Orlando Furioso* is that of Milan, 1818, in quarto, in which the learned editor Morali has faithfully restored the original text of 1532. The *Orlando Furioso* has been translated into most European languages, though seldom successfully. Of the English translations, that by Harrington is spirited and much superior to Hoole's, but the recent one by Mr. S. Rose is considered the best, and is generally faithful.

Ariosto is considered one of the best Italian satirists. The tone of his satires resembles that of Horace rather than that of Juvenal. He introduces several of the principal occurrences of his life, and exhibits the manners and vices of his time and country. He speaks of popes, princes, and cardinals, with great freedom, but in language generally, though not always, decorous. His satires, seven in number, and addressed to his brothers and other friends, were first published in 1534, after his death, and have been

often reprinted, both separately and with the rest of his works. He wrote five comedies in blank verse, *La Cas-saria*, *I Suppositi*, *La Lena*, *Il Negromante*, and *La Scolastica*. Cardinal Bibbiena, Ariosto, and Machiavelli, all three contemporaries, were the first writers of regular comedy in Italy. They adopted the manner of Plautus and Terence; they preserved the unities, and made their plots turn chiefly upon the intrigues and stratagems practised by dissipated and needy young men, assisted by worthless domestics, to deceive an old miser, a jealous husband or father, or a watchful guardian of some good-natured beauty. The language is often grossly indecent, and yet these plays were performed before the court and chivalry of those times. There are some other minor works of Ariosto, consisting of *canzoni*, *capitoli in terza rima*, sonnets, and a curious eclogue which has long remained inedited: it was composed in 1506, on the occasion of a conspiracy being discovered against the life of Duke Alfonso by his two brothers Ferrante and Giulio. There are also some short Latin poems on various subjects, and an epithalamium on Alfonso's marriage with the famous Lucrezia Borgia. They are all found in the Venice editions of Ariosto's works of 1741 and 1766, edited by Barotti.

Ariosto left two natural sons, Virginio, whom he had legitimated by public act in 1530, and who afterwards became a canon of the cathedral of Ferrara; and Giovanbattista, who was made a captain in the Duke's service. The number of commentators, critics, and biographers of Ariosto, is very great; some of the best have been mentioned in the course of this article. Baruffaldi junior has also written a life of Ariosto; Ferrara, 1807.

ARISH, or EL ARISH, a small town on a slight eminence about half a mile from the shore of the Mediterranean, and on the usual road from Egypt to Syria, 31° 5' N. lat.; 33° 48' E. long. There are some wells near it, and some clumps of palm-trees between the town and the sea. Thevenot (*Voyage de Levant*, p. 360) describes the castle, in his time, as being well built of small stones; and he says there were so many fine ancient columns at Arish, that the inhabitants made their coffee-houses and their wells of them, and the cemeteries also were filled with such remains. There are still some Roman ruins, and several marble columns at Arish. (Mangles and Irby.) Arish is the site of the ancient Rhinocolura, which was often considered a kind of frontier town between Egypt and Syria; and, in connexion with Petra in the interior, was an entrepôt of some importance (Strabo, 781). It stands on a small inlet of the sea, and near a scanty stream of water. The French took possession of it in February, 1799, in their expedition to Egypt, and kept it for some time.

It was at Arish that Sir Sydney Smith concurred a convention with the French army, allowing them to return to France with their baggage and arms, which was subsequently disavowed by the British government.

ARISTÆNETUS, a Greek writer, a native of Nicæa, whose epoch is not capable of being accurately determined. It has been conjectured that the Aristænetus to whom are attributed the *Erotic or Love Letters* (*Ἐπιστολαὶ ἐρωτικαὶ*) is the person to whom several of the letters of Libanius are addressed, and who lost his life in the earthquake at Nicomedia, A.D. 358: some are inclined to place him at a later epoch.

These Letters, of which there are two books, are a species of rhetorical exercise, and not real letters; they often exhibit very bad taste, but are of some value as presenting a picture of the manners, or at least of the literature, of the age. The latest and best edition is by Boissonade, Paris, 1822, 8vo. There is a German translation of Aristænetus by Herel, Altenburg, 1778, 8vo.: there are also several French translations.

ARISTEAS. [See SEPTUAGINT.]

ARISTARCHUS of Samos, an astronomer, lived about the same time as Archimedes, and some say survived him, though this is not likely. Archimedes died B.C. 212, but there is an observation of the solstices made by Aristarchus, and preserved by Ptolemy, of the date B.C. 280. (See Ptol. *Syntax*, iii. c. 2, tom. i. p. 163, ed. Halma.) Some accounts (in modern books) place him much earlier, but these are necessarily incorrect. In Plutarch's treatise *On the Appearances in the Moon's Disc*, it is said that Cleanthes, the successor of Zeno in the Stoic school, asserted that Aristarchus deserved punishment for his opinions about the earth's motion. This treatise of Cleanthes is cited by Dio-

genes Laertius. Whether the charge was ironical or not (Montucla conjectures the former), it serves to corroborate the preceding date, since Cleanthes succeeded Zeno about B.C. 264. We know nothing further of the life or death of Aristarchus.

Archimedes (in the *Arenarius*) attributes to Aristarchus the opinion that the earth moves round the sun, which is supposed to have been previously held by Pythagoras and Philolaus. His words are, 'He (Aristarchus) says, that the fixed stars and sun remain without motion, but that the earth is carried round the sun in the circumference of a circle, the sun being in the centre. and that the sphere of the fixed stars, which has the same centre as the sun, is so great that the circle described by the earth bears no more proportion to the distance of the fixed stars, than the centre of a sphere does to its surface.' Archimedes then proceeds to combat the singular notion contained in the last words. The passage from Plutarch's treatise on the moon, above referred to, states that Aristarchus supposed the heavens to be fixed, and that the earth moved in an oblique circle (λοξοῦ κύκλου), at the same time revolving round her own axis. We learn also from Archimedes, that Aristarchus supposed the apparent diameter of the sun to be the 720th part of the zodiac, that is, half a degree. This is about 2' too little.

One small work of Aristarchus has come down to us, 'On the Magnitudes and Distances of the Sun and Moon, which makes no mention of the preceding hypothesis with regard to the earth's motion. The scope of it will be shown in the following translation of the introduction (from Wallis's edition). The brackets contain remarks, mostly from Delambre.

'1. The moon receives light from the sun. [This was asserted before Aristarchus.]

'2. The earth is a mere point or centre when compared with the sphere of the moon. [This is wrong, since the moon would then appear at the same point of the heavens from different parts of the earth, which is not the case.]

'3. When the moon appears halved, the great circle separating the light and dark part of the moon passes through the eye of the spectator. [A very simple truth, but a great step in astronomy, as giving rise to the first determination of the relative distances of the sun and moon, the principle of which was correct.]

'4. In the preceding case, the angle between the sun and moon is less than a quadrant by its thirtieth part. [That is, the angle is 87° ; whereas $89^{\circ} 50'$ is nearer the truth.]

'5. The apparent diameter of the earth's shadow [that is, the section through which the moon passes in an eclipse] is twice that of the moon. [This would give it $64'$; it is nearer to $82'$.]

'6 The moon subtends the fifteenth part of a sign. [This would make the apparent diameter 2° , which is four times too great.]

'Hence the distance of the sun from the earth is more than 18 times the distance of the moon, and less than 20 times; that is, when the moon appears halved. And the [real] diameter of the sun bears the same proportion to the [real] diameter of the moon. The diameter of the sun bears to that of the moon a greater proportion than 19 to 3, but a less proportion than 43 to 6, as appears from what has been found of the ratio of the distances, the shadow of the earth, and the moon's subtending the 15th part of a sign.'

The preceding deductions follow correctly from the principles laid down, and of course partake of their numerical inaccuracy. The manner in which they are proved shows that the Greeks of this period had no trigonometry whatever; not even a table of chords, and the limits given are not so close as those which might have been obtained from the same data by a ruler and compasses. There are several propositions on the relative bulks of the three bodies, deduced by common methods.

There is a commentary of Pappus upon the work of Aristarchus, which has been given (in part at least) by Wallis in his edition.

From an obscure passage in Plutarch (*Πλουτάρχου Σημειώματα*. 8), in which the report of Archimedes is corroborated, Delambre infers that Aristarchus attributed day and night to the rotation of the earth. It is hard to see how he could do otherwise, if he supposed the sun fixed.

There is another work attributed to Aristarchus, published by Roberval at Paris, in 1543, on the System of the World. But this appears to have been probably one of the *restora-*

tions of which we have spoken in APOLLONIUS, as Des cartes and several others affirm that it was written by Roberval himself, and Wallis asserts that this fact was perfectly well understood by the French, both at the time of publication and in his time.

Vitruvius speaks highly of Aristarchus, as the inventor of many useful machines, and, in particular, of a dial which he terms *scaphæ*. This dial is described by Martianus Capella (cited by Weidler), from which, and partly from the name, we should infer that it was a part of a concave hemisphere, with a style ending in the centre, so that by drawing the equator, &c. inside the hemisphere, the sun's position might be found by marking the extremity of the shadow. Montucla describes one, dug out at Tusculum in 1741, which, since Cicero describes such an instrument, is conjectured to have belonged to him. (*Mont. Hist. Math.* i. 721; a drawing is given.)

The principal editions of Aristarchus are the Latin translation of Valla, Venice, 1498, containing the commentary of Pappus; and of Commandine, Pesaro, 1572; the Greek text of Wallis, Oxford, 1688, with a commentary and Commandine's version, which edition was also reprinted in the second volume of Wallis's works, Oxford, 1699. A new edition of the Greek text, with a Latin translation, appeared at Paris in 1810, 8vo. There is also a French translation by M. de Fortia D'Urban; Paris, Didot, 1823.

ARISTARCHUS, the critic, the son of Aristarchus, was born in the island of Samothrace; but he abandoned the narrow limits of his own country, in order to settle in the wealthy and populous city of Alexandria. The time of his birth is not exactly known; but he is stated to have flourished about B.C. 158. Ptolemy Philometor, king of Egypt, reigned from B.C. 181 to 145, and Aristarchus was the preceptor of his son, who was killed by his uncle Ptolemy Euergetes II. at the accession of the latter in 145 B.C. (Justin, xxxviii. 8.) Aristarchus was the disciple of Aristophanes of Byzantium, the celebrated grammarian, who flourished about 200 B.C., and was the first Grecian who laid the principles of philological criticism upon a sound and accurate basis; thus he was the first to inquire with precision into the genuineness of the early Greek writings, and into the grammatical analogy of the Greek language; he likewise introduced the use of the Greek accents, as they may now be seen in manuscripts and printed books (Wolf, *Proleg. ad Homer.* s. 44). Aristarchus succeeded his master Aristophanes (for whose opinions he is stated to have entertained great respect), as head of the grammatical and critical school of Alexandria; and obtained in that capacity, by his eminence as a teacher and by his various writings, a reputation greater than any other critic of antiquity. Forty grammarians are stated to have proceeded from his school (Suidas in *Ἀριστάρχου*), who doubtless contributed to spread his fame over Greece and the neighbouring countries. His name was highly celebrated among his contemporaries; thus Panætius the philosopher called him a *diviner*, from his facility in conjecturing the meaning of poets (*μάντις*, Athenæus xiv. p. 634. C.); and after his death, his authority was so much esteemed, that Horace and Cicero used Aristarchus as a general name for a great critic (*De Arte Poet.* 450. *Epist. ad Att.* l. 14), and Sextus Empiricus mentions him with Plato and other such eminent names (*Adv. Mathem.* ix. s. 110); one of the scholiasts to Homer likewise expresses an opinion (which a modern critic has applied to other persons), that it is better to err with Aristarchus than to be right with Hermapias, a grammarian of little note (*ad Il.* 235).

The critical works of Aristarchus appear to have been very voluminous, but they are now all lost, and are only known from extracts and citations preserved in other writers. His chief work was his edition of the *Iliad* and *Odyssey*, in which, 1. he revised the text, partly by means of the comparison of MSS., and partly by conjecture; 2. he divided the two poems into twenty-four parts or books, each distinguished by a letter of the Greek alphabet, which in the Alexandrine age contained twenty-four letters (*Incertus de Hom. Poesi.* in Ernesti's *Homer.* vol. v. p. 152); and 3. he placed certain critical marks before certain lines, some denoting that the verses so marked contained something worthy of notice, and others that they were spurious; the last were merely straight lines thus —, in the form of a spit or *obelos*, whence *ὀβελίσκειν* in Greek and *obelos notare* in Latin, 'to mark with an obelus,' meant to mark as spurious. The reasons for the changes which he made in the text, and for the marks

which he prefixed to the verses, and his explanations of doubtful passages, he appears to have given separately in some of his commentaries or *ὑπομνήματα*, of which he is stated to have written more than 800 books. (Suidas in v.) Probably these *books* were not longer than such divisions as we should now call chapters; these commentaries, however, included not only his labours on Homer, but also illustrations of Hesiod, Archilochus, Alcæus, Anacreon, Æschylus, Sophocles, Pindar, Aristophanes, Aratus, and other poets. Of these latter productions of Aristarchus few remnants have been preserved; of his Homeric criticisms, however, a large part is extant in the Scholia to Homer, from which a tolerably complete notion of his mode of treating ancient Greek poets may be formed. One of the most remarkable features of his criticism is the boldness with which he condemned numerous verses as unworthy of Homer, and as manifest interpolations of a later age. Various opinions have been formed on these judgments of Aristarchus; some moderns having thought that his method was in the highest degree arbitrary and uncritical, while others have thought that he exercised a sound and modest discretion. There can be no doubt that Aristarchus in rejecting verses of Homer for the most part did not rely on the faith of ancient copies, but trusted merely to his own sagacity in discovering the traces of interpolation; 'as Aristarchus (says Cicero, to his correspondent) denies that Homer wrote the verses of which he does not approve, so do you suppose that whatever part of my letters may be wanting in clearness is not written by me.' (*Epist. ad Fam.* iii. 11, and see Clinton, *Fist. Hellen.* part iii. pp. 492-5.) Whatever theory may be adopted with regard to the composition of the Homeric poems, whether we suppose that the *Iliad* and *Odyssey* were both entirely written by one poet, or that each was the work of a separate poet; or that they were a series of rhapsodies composed by a number of early bards, whose scattered songs, being originally like the old Spanish and Scotch ballads, were afterwards collected and joined together; it is equally certain that every part must have received its proper form from its original author; and that verses and passages might have been improperly introduced at a later date by the reciters of these poems. Now these interpolations, if any such existed, were doubtless made before the age when the *Iliad* and *Odyssey* were first reduced to writing; and therefore they could not be detected by the mere comparison of manuscripts. Consequently, Aristarchus ought not to be taxed with rashness for condemning verses of Homer which might be found in all the MSS., nor should it be said with Cicero that he rejected those verses of which he did not approve, simply *because* he did not approve of them; he rejected them because he thought them unworthy of Homer, and inconsistent with the general character of his poetry and language. If the existence of any additions to the Homeric poems, of considerably later date than the body of the poem (as the last book of the *Odyssey*), is ever susceptible of proof, it can only be established by such probable and indirect arguments as those employed by Aristarchus in justification of his obeli.

The division of Homer into books was doubtless made by Aristarchus for the purposes of reference, which were important to critics such as himself; and it has been retained on that account ever since his time. The earlier Greek writers, as Herodotus, Plato, Aristotle, &c., in citing Homer, refer by description to the part of the poem which they mean, as the exploits of Diomedes, the descent into hell, the battle of the gods, &c.

Aristarchus did not confine his criticism to grammatical and metrical questions, but he also gave historical and geographical illustrations of the author's text. Thus we are told that he considered Homer to have been a native of Athens, and placed him at the time of the Ionic migration, sixty years after the return of the Heraclidæ, or one hundred and forty years after the fall of Troy. (*Incertus de Hom. Poesi.* in Ernesti's *Homer*, vol. v. p. 151, comp. Wolf, *Prol. Hom.* p. cclvi.) His notes on the mythology and geography of Homer, preserved in the scholia, are very numerous. (See *Lehrs. de Aristarchi Studiis Homericis*, pp. 167-256.)

Aristarchus published two editions of his recension of Homer, as appears from numerous passages in the scholia to Homer, where the differences between the readings of the first and second editions are noticed. (*Lehrs. ib.* p. 27.) His recension became the established text of the *Iliad* and *Odyssey*, not only among the grammarians of

Alexandria, and their disciples; but among the copyists from whose transcripts the modern versions of Homer have been derived since the invention of printing. In the scholia to the *Iliad*, moreover, a constant reference is made to the explanations and obeli of Aristarchus, whose opinion is often stated without the addition of his name, as if he was pre-eminently the commentator of Homer. (Wolf, *Prol. ad Hom.* s. 47.)

Besides his edition of Homer and his Commentaries, he wrote some short works addressed to individuals, as to Philetas and to Comanus, the chief cup-bearer of the king (*Proclus ad Hesiod. Op. et Di.* 97); a treatise on the Paradox of Zeno, and another on the *Iliad* and *Odyssey*, are also mentioned. (*Lehrs.* p. 25.) These writings, which probably were occasional productions, were considered less accurate and elaborate than his Commentaries (see *Schol. Il.* ii. 111; *Lehrs.* pp. 20-6). He wrote also in defence of analogy in matters of criticism, against Crates the grammarian, who defended the principle of anomaly. (Wolf, *ib.* p. ccxxx.) He is likewise stated to have contended at Pergamus with Crates, who was a native of that town; and Zenodotus of Mallus (a different person from his more celebrated namesake of Ephesus), a disciple of Crates, wrote a book in defence of the verses in Homer rejected by Aristarchus. (Suidas in *Ζηνόδοτος*, comp. Clinton, *F. H.*, part iii. p. 491.) Late in his life he appears to have retired from Alexandria to Cyprus, where, being afflicted with a dropsy, he died of voluntary starvation at the age of 72; leaving as his successor in the Alexandrine school his disciple Ammonius. (Suidas in *Ἀμμώνιος*.) He had two sons, named Aristarchus and Aristagoras, who were both idiots; the former was sold as a slave (probably because he was a burden to his family), but having been brought by his master to Athens, he was redeemed by the Athenians, out of respect (as it appears) for his illustrious father. (Suidas in v.)

ARISTIDES (Ἀριστίδης), son of Lysimachus, a great Athenian statesman and general, who took a leading part in the delivery of Greece from the Persian invasion. He was of the tribe Antiochis, and born in Alopecce, a demos of Attica. Some doubt exists concerning his endowments of wealth and birth—a question of so little importance that we shall not stop to discuss it. It is to be regretted that Plutarch, from whom our knowledge of his personal history is almost exclusively derived, has given us little information as to the steps by which he rose to eminence in the state. Several anecdotes illustrative of his probity are told by that amusing, but not very accurate author, which, according to this arrangement of his life, ought to have occurred before the Persian war; but the date of their occurrence is not fixed, and they contain no distinct mention of Aristides's public employments, except that he was twice chosen treasurer of the public revenue of Athens. Plutarch further states, that Themistocles and others, whose malpractices he had exposed, had influence enough to procure his condemnation on a charge of malversation; but that, by the exertions of the more virtuous citizens, the fine imposed on him was remitted, and he was again elected to the office of chief treasurer. It appears that he was early opposed in politics to Themistocles, whose ambitious and unscrupulous temper led him to promote both his own and his country's benefit by measures quite at variance with the integrity and straightforward temper of Aristides. But the first distinct notice which we possess of his public life is, that he was one of the ten commanders who directed the Athenian army, B. C. 490, upon the occasion of the Persian invasion under Datis and Artaphernes. This rests on the authority of Plutarch, who ascribes to Aristides the honour of having first yielded his turn of command to Miltiades, and by his example and authority having carried the dissentients with him. (For a fuller account of these circumstances, and the battle of Marathon, see MILTIADES, and *Historical Parallels*, vol. i. p. 267.) Plutarch adds, that when the Athenians marched back to their capital in haste, to prevent the flying Persians from making any attempt on it by sea, Aristides was left with the men of his own tribe to guard the valuable spoil of the Persian camp; being selected for that duty on account of his incorruptible honesty. But Herodotus, in his account of the battle (vi. 109), never even mentions Aristides's name. This proceeded from no unfriendly feeling; for the historian (viii. 79) bears testimony to him as the 'justest and best man in Athens.' This silence would lead us to doubt whether Aristides did really act so important a part in the action as his biographer would

have us believe. That he did distinguish himself is, however, rendered probable by his having been elected archon *epónymos* in the following year. (Plut. Arist. c. 5.)

Of the transactions of his magistracy we have no account. In the sixth year after it (B.C. 483), he was banished by the process called *ostracism*. A person less obnoxious to the spirit of jealousy which dictated that singular expedient, whether of jealousy or precaution, could hardly have been found; but the practices of Themistocles prevailed with the suspicious temper of the Athenians against the approved integrity of his rival, though so well recognized, according to a story told by Plutarch, as to have already acquired for him the appellation of 'the Just.' In the third year afterwards (B.C. 480), the eventual transactions of the Persian invasion under Xerxes took place. At the battle of Artemisium, Aristides was still in exile; but before the battle of Salamis he was recalled, with other exiles. In the night preceding that memorable battle, he passed from the island of Ægina through the Persian fleet, bearing intelligence to his countrymen that they were surrounded, and that flight, which they were then meditating, was no longer possible. (Herod. viii. 79.) The details of the action do not belong to this place. (See *Historical Parallels*, p. 360, and SALAMIS.) We have only to state that Aristides, at the head of a body of Athenians, landed on the small island of Psytaleia, near Salamis, and put to the sword the Persian troops stationed on that island. (Herod. viii. 95; Plut. c. 9.) With respect to the prosecution of the war, he combated Themistocles's advice to sail for the Hellespont, and destroy the bridge built by Xerxes; and recommended, on the contrary, that every facility for evacuating Greece should be given to the Persians.

Before the battle of Platæa, fought in September, B.C. 479, he was reinstated in all and more than his former favour with his countrymen. The answer returned to Mardonius's offer of peace and alliance with the Athenians is said by Plutarch to have been dictated by him: 'Tell Mardonius that the Athenians say, while the sun goes in the same course as he is now going, we will never make peace with Xerxes; but we will fight him, trusting in the gods, who fight with us, and the heroes, whose temples and statues he, making no account of them, has burnt.' (Herod. viii. 143.) Aristides was one of the ambassadors sent to remonstrate with the Spartans for their tardiness in sending succours to resist the threatened second invasion of Attica by Mardonius; and at the battle of Platæa, contrary to the general usage, he was appointed sole general (*σπαρτηγός αὐτοκράτωρ*) of the Athenian troops, and signalized his moderation in a dispute with the Tegeatæ concerning the right of occupying the left wing of the allied army, the second post in point of honour, the right wing being always held by the Lacedæmonians. 'We came here,' he said, 'not to talk, but to fight. Since, however, the Tegeatæ have advanced their claims to renown, both in old times and of late, it is necessary that we also should explain to you our claims to priority over the Arcadians.' Then, after enumerating the warlike glories of his countrymen, he added, 'But this is no time to wrangle about place. We are ready to obey you, Lacedæmonians, wherever, and against whomsoever, you choose to station us; and wherever we are, we will do our best. Command us, therefore, as men who will obey.' The Lacedæmonians answered by acclamation, that the Athenians were more worthy than the Tegeatæ to lead the left wing. (Herod. ix. 27.) It is to be observed here (as of the answer returned to Mardonius), that what Plutarch says of Aristides, Herodotus says of the Athenians generally. It may be presumed, however, that on both occasions the people acted under the guidance of their leader; and that the words so full of wisdom, spirit, and moderation, agreeing so well with the character of Aristides, were really prompted or delivered by him.

Not long after the restoration of Athens, which had been destroyed by Xerxes and Mardonius, an important change took place in the constitution: though opposed to the principles of those with whom Aristides generally acted, it was supported at least, if not brought forward by him. By Solon's laws, noble descent and a definite amount of property were required as qualifications in candidates for the higher offices. It was now thought, either that in the great exertions made for the existence of the state, all had merited alike, and all were therefore entitled to an equal share in the direction of public affairs; or that the more numerous class who were excluded by law from the administration, having arms in their hands, and proud

of their recent exertions and success, would scarcely be brought to acquiesce in their former political inferiority. Aristides, therefore, proposed an alteration in the law, by which all were rendered eligible to the archonship, without regard either to birth or wealth. [See ARCHON.]

Aristides was the colleague of Thucydides in an embassy to Sparta, when the Spartan government interfered to prevent the rebuilding of the walls of Athens, destroyed by the Persians. (Thucyd. i. 91.) Cicero relates a story (*Off. iii. 11*), told in a slightly different manner by Plutarch, that Themistocles, after the end of the war, announced to the assembly of the people, that he had a scheme to propose greatly advantageous to the state, but of such a nature that it could not safely be made public. Upon this he was desired to communicate it to Aristides, who reported that nothing could be more advantageous, or less honourable; and the proposal was dropped without further inquiry. The measure proposed, according to Cicero and Valerius Maximus (vi.), was to burn the Lacedæmonian fleet at Gythium; according to Plutarch, to burn the dock-yard of the Grecians (*ναυσταθμον τῶν Ἑλλήνων*), by which we suppose the confederate fleet was meant. It is difficult to conceive how either measure could be reconciled with sound policy, any more than with justice. Diodorus (xi. 42) has a different version still of the same story, agreeing in the one point of the proposal of Themistocles being referred to Aristides.

B.C. 477, the unpopularity of the Lacedæmonians, especially of the commander-in-chief Pausanias, induced the Ionian Greeks to decline serving under him. They offered the command of the confederacy to Athens, whose ships at that time were under the command of Aristides; and to his moderation and probity, and to the favourable opinion entertained of the Athenian character, mainly through his virtues, that transfer of the command is chiefly to be ascribed, and the consequent establishment of what is called by historians the Athenian rule in Greece, which was overthrown seventy-two years afterwards, at the end of the Peloponnesian war. Under this new arrangement the Greeks of the west coast of Asia Minor, the islands, and Thrace, in conjunction with the Athenians, engaged to maintain a fleet sufficient to prosecute the war with Persia. Each state was assessed to furnish a certain sum of money, amounting in the aggregate to 460 talents; and the difficult task of making the assessment was executed by Aristides with such fairness, that, according to Diodorus (xi. 47), he obtained the highest praise for justice. Deputies from the states met in the sacred island of Delos, where the temple of Apollo was appointed for the common treasury, and officers called Hellenotamæ, 'treasurers of the Grecians,' of whom the chief was Aristides, were appointed to regulate the distribution of the common fund.

This is the last public office in which we know Aristides to have been engaged. The precise time of his death is not mentioned by the early Greek historians, or by Plutarch. Nepos says that it occurred in the fourth year after the ostracism of Themistocles, which fixes it to 467. Plutarch quotes a story from Craterus of his having been accused of taking bribes from the Ionians to reduce their annual contribution to the common fund, and being fined five minæ, which being unable to pay, he retired to Ionia, where he died. But the story is in itself highly improbable, and the silence of certain writers seems conclusive against it; and Plutarch himself argues against its credibility. He says also that the tomb of Aristides was in his own time to be seen at Phalerum, erected at the charge of the state, because the patriot died so poor that nothing was found in his house to pay for his burial. He left children—a son, Lysimachus, who is one of the speakers in Plato's dialogue of *Laches*, and two daughters (Plut. 27); all of whom were provided for by the state. Lysimachus had a pension and a grant of lands at Estæia in Eubœa. (Demos. *Leptin*. cap. 24.) Aristides lived and died in poverty, after having borne the highest offices of Athens, and possessed the most tempting opportunities for percolation of any man in Greece; a voluntary poverty, for he is said to have refused large sums offered to him by private liberality, saying that 'he could better boast of his poverty than others of their riches, which many did use ill, and few well: and that it was a hard thing to find one man of a noble mind that could away with poverty, and that such only might be ashamed of poverty as were poor against their wills.' (North's *Plutarch*.)

The character of Aristides (so far as we can trust our

chief authority, Plutarch, who is supported by the more scanty testimony of Herodotus and Thucydides) is one of the finest in antiquity. To him belongs the rarest of all praises, that of observing justice, not only between man and man, but between nation and nation. He was truly a patriot, for he preferred the good of his country to the gratification of his own ambition. A candid enemy, an impartial friend, a just administrator of other men's money, an observer of national faith, it seems hardly worth while to add to this catalogue of virtues the more common merit of being a brave and successful general, except that this latter quality completed his character, and fitted it to the stormy times in which he lived, giving to it a lustre and importance in the eyes of the many, which his peaceful virtues unassisted might have failed to command.

In the Elgin collection of the British Museum, there is a sepulchral stele, which bears the name of 'Aristides, the son of Lysimachus, of Estiæa.' It is conjectured that this Aristides was the grandson of Aristides the Just. (See *Elgin Marbles*, vol. ii., 149; Herod.; Plutarch, Cornelius Nepos, *Lives of Aristides*; Mitford, &c.)

ARISTIDES, a native of Thebes, and one of the great Greek painters, is said by Pliny (xxxv. 10) to have been the contemporary of Apelles. His excellence consisted in giving character and expression to his figures, and in the strong delineation of the passions: his colouring was hard. One of his great pictures represented the capture of a city. Among the most striking figures was that of a mother just expiring from a wound; her infant still clings to her breast, and the dying mother seems only anxious that her child should not suck the blood that is streaming from her body. Alexander the Great had this picture removed to Pella in Macedonia. He also painted an engagement with the Persians: this picture contained one hundred figures, and was liberally paid for by Mnason, tyrant of Elatea. The works of Aristides were numerous, and many of them were transferred to Rome with the rest of the plunder of Greece. At the capture of Corinth by L. Mummius, Polybius, the Greek historian, who was present on the occasion, saw with indignation the barbarians of Italy playing at games of chance on the most costly pictures which they had spread on the ground. (Strabo, p. 381.) A Dionysus (Bacchus) by Aristides, and a Hercules struggling with the poisoned shirt of Deianira, by the same artist, were treated in this shameful way. Strabo himself saw the Bacchus, which, by chance, had been safely transferred to Rome, in the temple of Ceres, and he pronounces it a most beautiful work of art. Unfortunately the picture was shortly after destroyed, when the temple of Ceres was accidentally burnt: Pliny also mentions this picture. Another fine painting of Aristides in the temple of Apollo at Rome was spoiled by an artist, whom M. Junius the Prætor had commissioned to clean it preparatory to its exhibition at the Ludi Apollinares.

See a passage in Athenæus (xiii. 567) on other subjects painted by Aristides.

ARISTIDES, ÆLIUS, a distinguished rhetorician of the second century, was born at Hadriani in Bithynia, probably about A.D. 117: but, according to other opinions, A.D. 129. He studied at Smyrna under Polemo, and at Athens under Herodes Atticus, after which he travelled extensively in Asia and in Egypt; finally, he settled at Smyrna, where he obtained the priesthood of Æsculapius. He also opened a lecture-room and gained such reputation by his rhetorical prelections, that by his contemporaries he was placed on a level with Demosthenes, the great Athenian orator. In A.D. 178, Smyrna was destroyed by an earthquake, and Aristides, by addressing a letter on the subject, which is still extant, to M. Aurelius, induced the emperor to restore the city. Owing to his services on this occasion, and the high reputation which he enjoyed as a rhetorician, statues were erected to his honour; one, now in the Vatican (see Winckelmann, ii. 475, French ed.), bears his name, and it is by no means improbable that the statue supposed by some to represent Aristides of Athens, really belongs to this Aristides, who affected to rival Isocrates and Demosthenes.

Of his fifty-five declamations, one entitled *Against Lep- tines*, is an imitation of the great oration of Demosthenes, which bears the same name; and another, the *Panathenikos*, was intended to show that he could write in the style of Isocrates, and rival one of the most famous specimens of that master. Aristides wrote also panegyrics on many distinguished cities, such as Smyrna, Rome, &c.

It was the practice of Aristides and other rhetoricians of his age, often to choose their topics from the republican times of Greece, and particularly from the most striking events of Athenian history. But instead of throwing any light on the historical events which they made their text, it is more frequently the case that in the effort after rhetorical effect, the truth of history is sacrificed to what were then considered the graces of style. The poverty of ideas in their declamations, and the total absence of the old Attic vigour of language, render them of less value in the judgment of the present age, than in that of the contemporaries of Aristides.

The latest edition of the Declamations of Aristides, together with his two books on Rhetoric, is by W. Dindorf, Leipzig, 1829, 3 vols. 8vo.

The statue which we have here assigned to Ælius Aristides was found in the ruins of Herulanum, and is now in the Museo Borbonico at Naples. The height is about 6½ feet. It is called the statue of Aristides the Just by G. Finati, in the work entitled *Museo Borbonico*; but from comparing the head with that of Ælius Aristides in the Vatican, and from the somewhat affected attitude, and the general character of the figure, we are convinced it is not the old Aristides. It may be objected by some that this statue is superior, as a work of art, to the age to which we have assigned it. The objection may be a good one; and the only conclusion then must be, that we do not know whom it was intended to represent. A cast of this figure may be seen at Sarti's, Dean Street, London.

ARISTIDES QUINTILIANUS, a Greek writer on music, whose age is uncertain, as he is not mentioned by any other ancient author. Some critics are of opinion that he was contemporary with Plutarch. His work on Music (*Περὶ Μουσικῆς*), in three books, is printed in the Collection of Meibomius, and is considered one of the most valuable musical works of antiquity. For further remarks, see GREEK MUSICAL WRITERS.

ARISTIPPUS, the son of Aritades, was born at Cyrene, a Greek colony on the north coast of Africa, and came to Athens when a young man in order to profit by the lessons of Socrates; his curiosity to hear this philosopher having been excited by some accounts of his doctrines which he had received from Ischomachus of Athens, whom he met at Olympia, during the celebration of the Olympic games. (Plutarch, *de Curiosit.* c. 2; on Ischomachus, see Xenophon's *Æconomic.*) Aristippus was a hearer of Socrates for some time; and as he could not have been very young when he went from Cyrene to the Olympic festival, and was attracted from thence to Athens by a philosopher's fame, we may suppose that he was at least twenty-five years old at the death of Socrates, B.C. 399; which would make his birth as early as B.C. 424 or 425. Lais, the courtesan, with whom he was in habits of intimacy, was born B.C. 421. (Clinton, *Fast. Hellen.*, part ii. introd. p. lv.) which agrees

with this determination. We know further, from explicit testimony, that he was celebrated in B.C. 366 (Olymp. ciii. 3; Diodorus, xv. 76); so that if he lived to the natural age of man, he probably died between B.C. 360 and 350.

Although Aristippus was a disciple of Socrates, his mode of life and his opinions were very different from those of his master. Instead of imitating the chaste, frugal, and temperate habits which distinguished Socrates, he was a lover of sensual pleasure; and we learn from a conversation between Aristippus and his master, reported in Xenophon's *Memorabilia*, that the former deliberately maintained in argument the superiority of his own habits of life and principles of conduct. In this discussion, being pressed by the interrogations of Socrates, he asserts that he does not wish to take any share in public affairs, that his object is to be neither a governor nor a slave, but a private citizen; and that he lives out of his own country in order to escape from all political duties. (*Xen. Mem.*, ii. 1. 1-18.) He appears to have prided himself on his knowledge of the world, on the popularity and versatility of his manners, and the ease with which he could adapt himself to the company of all persons, and to all varieties of fortune: hence Plato is reported to have said of him, that he was the only man who could wear with equal grace both fine clothes and rags. He recommended to others, as he practised himself, the pursuit of sensual pleasure, saying that the disgrace consisted not in enjoying it, but in being overcome by it. He attempted to profit by circumstances in order to adapt them to his own wants, and to be the arbiter rather than the slave of fortune; whence Horace says:—

'Nunc in Aristippi furtim præcepta relabor.
Et mihi res, non me rebus, subjungere conor.'

His principles and conduct made him obnoxious to Xenophon, with whom he is stated to have been on bad terms, and to Antisthenes, the head of the Cynic school, whom he is reported to have constantly ridiculed for the austerity of his manners. (*Diog. Laert.* ii. 65; Suidas in *Ἀριστιππος*.) Plato likewise aims a blow at him in the *Phædo*, for passing his time in luxurious enjoyment at *Ægina*, while his master Socrates was under sentence of death at Athens, at a distance of a few hours' sail. (*Plato, Phædon*, p. 59, ed. Steph.; Demetrius Phalereus *de Elocut.* § 288, ed. Schneider; see also *Aristot. Rhet.* ii. 23, for a saying of Aristippus against Plato.) But Aristippus, although on bad terms with Xenophon, Antisthenes, and Plato, entertained friendly relations with *Æschines*, another disciple of Socrates, and recommended him as a teacher of philosophy to Dionysius, the tyrant of Syracuse. (*Diog. Laert.* ii. 60, 82; *Plutarch De cohibenda Ira*, i. p. 462.) He seems to have remained true to the principle expressed by him in his conversation with Socrates, of avoiding his native country, and to have travelled to various Greek states; thus he passed much time at the court of Dionysius of Syracuse, and he is stated to have been taken prisoner by a satrap of the Persian king in Asia Minor. (*Diog. Laert.* ii. 79.) He probably retired late in his life to Cyrene, where we find his family and his school after his death. (*Diog. Laert.* ii. 86.)

Aristippus differed from Socrates and the genuine Socratic philosophers, not only in his mode of life, but also in taking money for his instructions (*Diog. Laert.* ii. 65, comp. *Xen. Mem.* i. 2. 60.): hence he is called by Aristotle a *sophist* (*Metaph.* ii. 2); a name which Aristotle never would have given to any person whom he considered a genuine philosopher. Aristippus, when blamed for teaching for money, defended himself (and it must be confessed with some reason), by saying that Socrates was provided for by the richest and greatest of the Athenians, whereas he had to provide for himself. (*Diog. Laert.* ii. 74.) Aristippus is reported once to have sent five minas to Socrates, who refused them, saying that his genius did not permit him to receive such a gift. (*Diog. Laert.* ii. 65.)

There can be no doubt that Aristippus was the founder of a philosophical school; but it is doubtful whether he inculcated his opinions in writing, or whether, like Socrates, he only imparted them orally to his disciples. A list of his works, chiefly dialogues, is given by Diogenes Laertius (ii. 85), on the authority of Panætius and Sotion; the latter of whom lived in B.C. 205, and wrote on the history and lives of the Greek philosophers. (*Clinton, Fast. Hellen.* part. iii. p. 526.) Sosicrates of Rhodes, however, who lived somewhat later, and wrote on the same subject, stated that Aristippus left nothing in writing. (*Diog. Laert.* ii. 84; *Clinton, ibid.* p. 565.) However this may be, it is certain that his doc-

trines were perpetuated after his death by his daughter Arete, and by another disciple named Antipater of Cyrene. Arete was the teacher of her son Aristippus, who, to distinguish him from his grandfather, was called *metrodidactus* (taught by his mother): and Theodorus the atheist, a philosopher of some note, is stated to have been a disciple of this Aristippus. Antipater, the other immediate successor of the elder Aristippus, is stated to have had disciples; but Hegesias and Anniceris, who were about contemporary with Theodorus, are the only philosophers in his branch of the Cyrenaic school of whose opinions anything is known.

As no precise or detailed account of the doctrines of Aristippus has been preserved, it is difficult to avoid confounding his opinions with those of his successors in the Cyrenaic school. The later Cyrenaics appear to have approached nearly to the doctrines of Epicurus: Aristippus, however, though agreeing in substance with the moral system of Epicurus, yet differed from it in many important particulars. Aristippus is stated to have considered ethics as the only subject which deserved the attention of a philosopher; and to have especially despised mathematical and physical science, as not being concerned about the happiness of mankind (*Aristot. Metaph.* ii. 2; *Diog. Laert.* ii. 92.) The ancient Cyrenaics, however, though they confined themselves to ethical philosophy, yet adhered to it only in name; for they divided ethics into five parts, viz. 1. on those things which ought to be pursued or avoided: 2. on the affections of the mind: 3. on moral actions: 4. on causes: and 5. on proofs: of which heads the first three alone belong to moral philosophy, while the fourth refers to physical, and the last to logical inquiries. Aristippus held that the happiness of man consists in pleasure, and his misery in pain: happiness being merely an aggregate of pleasures, and misery an aggregate of pains. That pleasure is the greatest good, he conceived to be proved by the fact, that the youngest children, and even brute animals, seek it, and avoid its contrary, pain. He did not, like Epicurus, consider the absence of pain to be pleasure, or the absence of pleasure to be pain: for he thought that pleasure and pain are accompanied with motion, whereas the absence of pain and pleasure is not accompanied with motion; the former of these two states being like sleep. He compared the three states of which the mind is susceptible, viz., pain, pleasure, or the absence of both, to the sea during a storm, during a gentle breeze, and during a perfect calm; but this analogy is not quite perfect, for the sea agitated by a gentle breeze is in a middle state between the storm and the calm; whereas the absence both of pleasure and pain, which is the middle state of the mind, is made to correspond to the calm, which is not the middle state of the sea. He further held, that all pleasures, whether sensual or intellectual, are equally good: one account even states that he considered the pleasures of the body as superior to those of the mind. Hence he taught, that however immoral an action might be, still the pleasure which it causes is a good, and desirable for its own sake. He did not, however, recommend an unrestrained pursuit of pleasure; true wisdom (he thought) consisted, not in abstaining from pleasure, but in seeking it without being carried away by the love of it. Thus when reproached with his visits to Laïs, he replied that there was nothing disgraceful in going to her; the disgrace consisted in not being able to leave her. He condemned all care for the past or the future, all regret and all forethought, as equally useless; and said that a person ought to think only of the passing day, and, if possible, only of the passing minute. He recommended calmness of mind and moderation of desires: and he particularly cautioned his daughter Arete against covetousness and love of money. He also thought that the wise man should be free from the passions of envy and love, from superstition, and from the fear of death. Such is a brief summary of the principal moral doctrines of Aristippus which have been recorded by ancient writers; in which there is less acuteness than is usually perceptible even in the most mistaken systems of the Greek philosophers. They do not indeed appear to have attracted much attention in his own time: for Aristotle, in his *Nicomachean Ethics*, when examining the different opinions of philosophers on the subject of pleasure, takes no notice of Aristippus. (See the *Life of Aristippus* by Diogenes Laertius, ii. 65-104, with Menage's notes; Suidas in *Ἀριστιππος*; and Ritter's *Geschichte der Philosophie*, vol. ii. pp. 87-103.)

ARISTOBULUS accompanied Alexander the Great in his campaigns, of which he wrote an account after the

king's death. This work, now lost, is one of the chief authorities for Arrian's history of Alexander. (See Arrian's *Preface to his Anabasis*.)

ARISTOBULUS: several of this name belonged to the Asmonæan dynasty. [See *ASMONÆANS*.]

ARISTOCRACY, according to its etymology, means a government of the *best* or *most excellent* (*ἀριστοί*). This name, which, like *optimates* in Latin, was applied to the educated and wealthy class in the state, soon lost its moral and obtained a purely political sense: so that aristocracy came to mean merely a government of a *few*, the rich being always the minority of a nation. When the sovereign power does not belong to one person, it is shared by a number of persons either greater or less than half the community: if this number is less than half, the government is called an *aristocracy*, if it is greater than half, the government is called a *democracy*. Since, however, women and children have in all ages and countries (except in cases of hereditary succession) been excluded from the exercise of the sovereign power, the number of persons enumerated in estimating the form of the government is confined to the adult males, and does not comprehend every individual of the society, like a census of population. Thus, if a nation contains 2,000,000 souls, of which 500,000 are adult males, if the sovereign power is lodged in a body consisting of 500 or 600 persons, the government is an aristocracy: if it is lodged in a body consisting of 400,000 persons, the government is a democracy, though this number is considerably less than half the entire population. It is also to be remarked, that where there is a class of subjects or slaves who are excluded from all political rights and all share in the sovereignty, the numbers of the dominant community are alone taken into the account in determining the name we are to give to the form of the government. Thus, Athens at the time of the Peloponnesian war had conquered a number of independent communities in the islands of the Ægean Sea and on the coasts of Asia Minor and Thrace, which were reduced to different degrees of subjection, but were all substantially dependent on the Athenians. Nevertheless, as every adult male Athenian citizen had a share in the sovereign power, the government of Athens was called, not an aristocracy, but a democracy. Again, the Athenians had a class of slaves, four or five times more numerous than the whole body of citizens of all ages and sexes: yet as a majority of the citizens possessed the sovereign power, the government was called a democracy. In like manner, the government of South Carolina in the United States of America is called a democracy, because every adult freeman, who is a native or has obtained the rights of citizenship by residence, has a vote in the election of members of the legislative assembly, although the number of the slaves in that state exceeds that of the free population.

An *aristocracy*, therefore, may be defined to be a form of government in which the sovereign power is divided among a number of persons less than half the adult males of the *entire* community where there is not a class of subjects or slaves, or the *dominant* community where there is a class of subjects or slaves.

Sometimes the word *aristocracy* is used to signify, not a form of government, but a class of persons in a state. In this sense it is applied not merely to the persons composing the sovereign body in a state of which the government is aristocratical, but to a class or political party in any state, whatever be the form of its government. When there is a privileged order of persons in a community having a title or civil dignity, and when no person, not belonging to this body, is admitted to share in the sovereign power, this class is often called the aristocracy, and the aristocratic party or class; and all persons not belonging to it are called the popular party, or, for shortness, the people. Under these circumstances many rich persons would not belong to the aristocratic class; but if a change takes place in the constitution of the state, by which the disabilities of the popular order are removed, and the rich obtain a large share of the sovereign power, then the rich become the aristocratic class, as opposed to the middle ranks and the poor. This may be illustrated by the history of Florence, in which state the *nobili popolani*, or popular nobles (as they were called), at one time were opposed to the aristocratic party, but by a change in the constitution became themselves the chiefs of the aristocratic, and the enemies of the popular party. In England, at the present time, aristocracy, as the name of a class, is generally applied to the *rich*, as opposed to the rest of the community: some-

times, however, it is used in a narrower sense, and is restricted to the *nobility*, or members of the peerage.

The word *aristocracy*, when used in this last sense, may be applied to an order of persons in states of any form of government. Thus, the privileged orders in France from the reign of Louis XIV. to the revolution of 1789, have often been called the aristocracy, although the government was during that time purely monarchical; so a class of persons has by many historians been termed the aristocracy in aristocratical republics, as Venice, and Rome before the admission of the plebeians to equal political rights: and in democratical republics, as Athens, Rome in later times, and France during a part of her revolution. It would therefore be an error if any person were to infer from the existence of an aristocracy (that is, an aristocratical class) in a state, that the form of government is therefore aristocratical, though in fact that might happen to be the case.

The use of the word *aristocracy* to signify a *class of persons* never occurs in the Greek writers, with whom it originated, nor (as far as we are aware) is it ever employed by Machiavelli and the revivers of political science since the middle ages: among modern writers of all parts of Europe this acceptance has, however, now become frequent and established.

The word *oligarchy* is likewise of Greek origin, and it means, according to its etymology, a government of a *few*. By the Greek historians it is used as synonymous with aristocracy, nor did it convey any offensive meaning; among modern nations, however, it generally has an opprobrious force, and when used, it commonly implies that the writer or speaker disapproves of the government or dislikes the class of persons to which he applies that name.

There is scarcely any political term which has a more vague and fluctuating sense than *aristocracy*; and the historical or political student should be careful to watch with attention the variations in its meaning: observing, first, whether it means a form of government or a class of persons: if it means a form of government, whether the whole community is included, or whether there is also a class of subjects or slaves: if it means a class of persons, what is the principle which makes them a political party, or on what ground they are jointly opposed to other orders in the state. If attention is not paid to these points, there is great danger, in political or historical discussions, of confounding things essentially different, and of drawing parallels between governments, parties, and states of society, which resemble each other only in being called by the same name.

It has been lately proposed by Mr. Austin, in his work on *The Province of Jurisprudence*, to use the term *aristocracy* as a general name for governments in which the sovereignty belongs to several persons, that is, to all governments which are not monarchies. There would, however, be much inconvenience in deviating so widely from the established usage of words, as to make democracy a kind of aristocracy; and it appears that the word republic has properly the sense required, being a general term including both aristocracy and democracy, and signifying all governments which are not monarchies or despotisms. (See *Journal of Education*, Part viii. p. 299, and the words *REPUBLIC* and *DEMOCRACY*.)

ARISTOGITON, an Athenian closely connected with an important event in Athenian history, which will be more particularly treated under the head of *HIPPÍAS*. We shall only state here, that having conceived a mortal hatred against Hipparchus, son of Pisistratus and brother of Hippias, who held the tyranny of Athens (Thucyd. i. 20), he plotted, in conjunction with another Athenian named Harmodius, the death of the brothers, and succeeded in effecting the murder of Hipparchus at the Panathenaic festival, B.C. 514. Harmodius was slain on the spot; Aristogiton fled, but was subsequently taken and put to death by Hippias. After the expulsion of Hippias, when the constitution of Athens was brought nearer to a democracy, the memory of Harmodius and Aristogiton was honoured as that of martyrs in the cause of liberty. Bronze statues were erected to them in different parts of Athens; among others, by the celebrated Praxiteles. (Plin. xxxiv. 8.) Xerxes, when he took possession of Athens, B.C. 480, carried off the statues of Harmodius and Aristogiton, which he sent to Susa. They were afterwards restored to the Athenians, when Susa fell into the hands of Alexander, and in the time of Arrian they stood in the Ceramicus at Athens. (Arrian, iii. 16.) Various privileges and immunities were conferred on their descendants; and their exploit was regularly celebrated in song at the Panathenaic

festival (Philostratus, *De Vit. Apollonii* vii. 2; ap. Meursius, *Pisist.* c. xiv.), and became (we might instance a similar feeling in the frequent introduction of the names of Hampden and Sidney in patriotic toasts) a very favourite subject for the songs, called *scolia* (σκόλια), with which the Athenians enlivened their festive parties. One of these, composed by Callistratus, is commonly printed among the fragments of various authors at the end of the editions of Anacreon (see also Athenæus, xv. p. 695); and will be found translated in Bland and Merivale's *Anthology*, beginning

* I'll wreath my sword in myrtle bough.*

The first stanza of this is ascribed by Meursius, *Pisist.* c. xiv., to Carcinus. With reference to the custom, and other proofs of the affection with which the memory of Harmodius and Aristogiton was regarded, see Aristophanes, *Eq.* 786; *Ach.* 980, &c. We have, however, the testimony of Thucydides, (an early and dispassionate, though from his political opinions perhaps not a favourable witness,) that the act of Harmodius and Aristogiton arose entirely out of a private quarrel; and that, far from effecting the immediate delivery of Athens, it made the sway of Hippias jealous and severe, instead of mild and beneficent; and Herodotus speaks to the same effect (vi. 123). That this mistake, as to the motives and merit of their action, was of early date, we may infer from Thucyd. vi. 54. Mitford (ch. vii. § 5) expresses an opinion that it was sedulously inculcated and fostered by the party of the Alcæonidæ, the true expellers of Hippias, with a view to the former establishment of their own power; a supposition not in itself improbable, but unsupported on the part of the author by any references to authorities. (Thucyd. vi. 54, 9; Mitford, ch. v. 5, ch. vii. 5.)

ARISTOLOCHIÆ, or the birth-wort tribe of plants, consists of a small number of genera which principally inhabit the hotter parts of the world. They are in many cases used medicinally on account of their tonic and stimulating properties; and some of them are reputed remedies for the bite of venomous serpents. The distinguishing characters of the order reside in the flowers, which have no corolla, and are constantly divided into three segments; the number of the cells of the fruit is also three or six, and the stamens agree in the same ternary character; the fruit is always adherent to the calyx, or, as botanists say, inferior. Notwithstanding the accordance which thus exists between aristolochiæ and monocotyledonous plants in the ternary

number of the parts of their flowers their structure is otherwise truly dicotyledonous. The arrangement of the woody matter of which their stem is composed is in longitudinal plates, surrounding a central pith, and surrounded by bark; but what is very curious, these plates are not placed in concentric circles like most other exogenous plants, but continue to increase uniformly and uninterruptedly as long as the plant grows. (See Lindley's *Introduction to Botany*, p. 66.) The leaves are veined like those of dicotyledonous plants, and the embryo of the seed has two lobes.

The most common plants of this singular order are the different species of *asarum*, or, as the gardeners call them, *asarabacca*; little stemless plants with dingy-brown flowers hidden among the leaves. This colour, which is far from common in plants, appears characteristic of the whole order, for even in those species which have yellow flowers, a brown stain seems to be mixed with the colour so as to change it, or brown spots are scattered over the surface. The most remarkable species of the genus *Aristolochiæ* are those which, in many of the tropical parts of America, excite the wonder of travellers by the gigantic size or grotesque appearance of the flowers, such as *A. cymbifera*, the border of whose calyx resembles one of the lappets of a Norman woman's cap, and measures seven or eight inches in length (see *Botanical Register*, vol. xviii. t. 1543), and *A. cordiflora* and *gigantea*, the flowers of which are from fifteen to sixteen inches across, and are large enough to form bonnets for Indian children.

ARISTOLOCHIA, MEDICAL USES OF. The most valuable of the species is the *A. Serpentaria*, which grows in North America, chiefly in Virginia, and hence is called Virginian snake-root. Though the whole root is used, the rootlets are more powerful than the solid root. These consist of a large portion of woody fibre and gummy matter, which have no virtues, along with some resin, bitter extractive, and a little essential or volatile oil, on which principles its virtues depend. It communicates its properties to water and to alcohol, which are employed as the means of extracting them, by forming an infusion or a tincture. Decoction should never be employed, as the heat drives off the volatile oil.

Its odour and taste resemble valerian, angelica, and camphor. In its action on the human system it most nearly approaches to camphor, but its effects are more permanent. It chiefly influences the nervous system, and seems to act most beneficially in those cases where the capillaries, either from not receiving an adequate supply of blood, or of nervous energy, are incapable of producing upon the blood those changes, which form secretions in the glands, the skin, and other secreting surfaces, or which are essential for the maintenance of a sufficient degree of vital action in every part of the body. The diseases or disordered states of the system in which it may be advantageously employed can, therefore, be easily inferred.

In protracted fevers, whether of a continued or intermittent kind, it is often eminently serviceable. In those cases of continued fever, which do not assume a very active character, but run on to a lengthened period, commonly called *low* nervous fever, it is preferable to every other agent, and may either be used alone, or in conjunction with cinchona bark, or some of its preparations. Hence, under the title of Huxham's tincture of bark, it is very much used: but a safer mode of administration is that of an infusion of the *serpentaria*, to which sulphate of quinine, and orange-peel, or other aromatic, may be added; as recommended under *Ague* (Vol. I., p. 227).

In eruptive or exanthematous fevers, such as small-pox and measles, when the eruption is imperfectly formed or threatens to recede, an occurrence always betokening great danger, and indicating much feebleness in the powers of the system, *serpentaria* is an invaluable agent.

In the sore throat of scarlet fever, or in other affections of the throat, where gangrene is to be apprehended, from the depression of the vital powers, *serpentaria*, given internally, and used as a gargle, alone, or with tincture of capsicum, is more likely to prevent so serious a termination than any other medicine. In none of these diseases should it be exhibited till after the bowels have been thoroughly cleared out by proper purgative medicines. But there are other diseases, not attended with fever, in which *serpentaria* is extremely useful. In that form of indigestion where no inflammatory state of the mucous membrane of the stomach exists, and where the skin is harsh and dry, *serpentaria*

Aristolochia.

1. A branch of *Aristolochia* siph: 2. one of its flowers cut lengthwise, showing the stamens lying in its bottom; 3. a cluster of stamens; 4. a seed-vessel; 5. the same cut across to show its six cells; 6. a seed; 7. a seed cut through to show the minute embryo lying in the albumen; 8. an embryo much magnified.

alone, or better with sulphate of quinine, is eminently serviceable. On the same principle, in the state of torpor or exhaustion to which literary persons are subject, from long-continued or intense mental exertion, this combination is highly useful.

In America, the infusion or tincture of serpentaria is sometimes taken every morning in damp aguish situations, to prevent intermittents. It is likewise said to prove useful in the treatment of a kind of pleurisy accompanied with great derangement of the biliary system, of frequent occurrence in autumn, among persons exposed to the exhalations of the marshes in America.

This species, and several others, both in America, and the East and West Indies, are much employed as antidotes against the bite of serpents; and hence the name snake-root. Dr. Hancock states, that the quaco, used by the South Americans in such cases, belongs to this tribe.

ARISTOMENES, a remarkable personage of antient Greece, who holds a middle place between the mythic age and the commencement of history. As of the Spanish national hero, the Cid, or our own Richard the Lion-hearted, so we have an outline, probably a correct one, of his life, but filled up with exaggerated facts and fictitious adventures, which the minstrels of a rude age never fail to attribute to those whom popularity or notoriety renders fitting subjects for popular songs.

Of the early history of Messenia we know little. A race of kings descended from Cresphontes, the Heracleid leader to whom that district of Peloponnesus was allotted, governed the country, until, not very long after the legislation of Lycurgus, a series of disputes and skirmishes arose on the borders of Messenia and Laconia, which gave rise to a confirmed hatred. Prompted by this feeling, without declaring war, and indeed with studied secrecy, the men of Sparta bound themselves by oath never to return home until Messenia was subdued; and they commenced the contest by a midnight attack on Amphaia, a frontier town, which they took, and put the inhabitants to the sword. This was the commencement of what is called the first Messenian war. The chronology of these events, which in themselves are half fabulous, must of course be uncertain, and we can only give the dates of the conflicting systems of Newton and Blair, without pronouncing any judgment upon them. The former places the capture of Amphaia B.C. 652; the latter, B.C. 743. Under two able princes, Euphaes and Aristodemus, the Messenians continued the war for twenty years with various success; but in the end they were overpowered, and treated with great rigour. They bore the yoke for twenty-five years (Newton, thirty-nine Blair); at the end of which a new generation had grown up, high-spirited, impatient of their national humiliation, and of the tyranny of their Spartan masters. In Aristomenes, a young man of the royal blood, a leader was found qualified to command both their affection and respect. Endowed with prudence as well as courage, he refused to move until assured of external support, of which the antient jealousy of Arcadia and Argos towards their formidable neighbour, Sparta, gave good hope; and those states proved hearty in the cause. The revolt is dated by Pausanias (iv. 15) thirty-nine years after the end of the first war (*Ol. xxiii. 4*), B.C. 685 (Newton places it in 607), and the first battle was fought at a place called Deræ. It was obstinately contested, and each party claimed the victory; but even this doubtful issue was encouragement to the Messenians. Aristomenes performed more than one man seemed able to do, and his countrymen offered to him the regal dignity. This he declined; accepting however (under the title of *παραγῶς αὐτοπάριον*) the sole direction of military affairs. Upon this he undertook a singular enterprise, 'thinking it important above all things, by scaring the Lacedæmonians in the outset, to become more terrible in their eyes for the future.' He entered Sparta (an unwall'd town, and therefore of easy access) by night, and suspended a shield upon the temple of Athena of the Brazen House, inscribed, 'Aristomenes to the goddess, from the spoil of the Spartans.'

The year after the battle of Deræ a second engagement took place at a village called the Boar's Tomb. The Messenians were supported by auxiliaries from Elis, Argos, Sicyon, and Arcadia; the Lacedæmonians by Corinth and two minor cities. There was a chosen band of eighty Messenians who formed a sort of body-guard to Aristomenes, and fought around him; and to their exertions principally the Messenian legends ascribe the victory gained on this occa-

sion. At their head Aristomenes attacked and routed, after a hard fight, the flower of the Spartan troops ranged round their king, Anaxander. Leaving it to others to improve this success, he led his companions from point to point, wherever the enemy seemed most inclined to make head; and finally achieved so complete a victory, that the Lacedæmonians 'fled without shame, no longer waiting for one another.' Aristomenes lost his shield in a very odd way in the pursuit (see Paus. iv. 16, or *Historical Parallels*, i. p. 41), and we might conjecture from the story, that the Messenians, pressing too eagerly, received a check.

The war was continued in a series of predatory incursions, in the course of which some romantic adventures are told of Aristomenes, B.C. 604. (Blair, 682.) A third pitched battle was fought at Megalaphrus (the Great Ditch), in which the treachery of Aristocrates, prince of Orchomenus in Arcadia, and commander of the Arcadian auxiliaries, who was bribed by the Lacedæmonians, led to the entire defeat of the Messenians. So great a number were slain, that 'having before expected to become masters instead of slaves of the Lacedæmonians, they now gave up even the hope of safety.' Aristomenes found himself too weak to maintain his ground in the open field, or even to defend the inland forts; and he withdrew with his followers to the strong hold of Eira near the sea, abandoning to the Lacedæmonians all the country except a strip of land along the coast, held by the Pylians and Methonæans. From Eira he kept up a war of constant incursion along the Laconian border, carrying off agricultural produce and prisoners both from Laconia itself, and from Messenia, now occupied by the Lacedæmonians. At last the Lacedæmonians were obliged to prohibit the cultivation not only of Messenia, but of the borders of Laconia, 'as tilling the land rather for those who were in Eira than for themselves.'

This compelled the Messenians to seek their spoil in more distant excursions, in one of which Aristomenes was taken prisoner, and cast, with several of his companions, into a pit called Ceadas; such was the name of a place into which criminals at a later period were thrown at Sparta. All but Aristomenes were killed by the fall. For three days he lay waiting the slow approach of death; at the end of that time, his eyes being accustomed to the dim light, he saw a fox attracted by the dead bodies. The idea of escape then suggested itself; he caught the fox, and allowing it liberty enough to choose its own path, was conducted along a narrow passage terminating in a crevice just wide enough to admit the animal. He enlarged the opening with his hands, and returned to Eira. The news of his escape soon spread abroad; but the tale was so singular that the Lacedæmonians refused to credit it, until the rout of a body of Corinthians, with great slaughter, on their march to join in the siege of Eira, convinced them that 'Aristomenes, and no other, had done this.' After this exploit, he offered for the second time to the Ithomæan Jupiter the sacrifice called hecatomphonia, a rite peculiar to the Messenians, and performed by those who had slain a hundred men in battle. In the course of the war he had occasion to perform it a third time.

In the eleventh year of the siege of Eira, the fulfilment of an oracle warned Aristomenes that the contest could not be much longer protracted. The Messenians were in possession of some mystical treasure, which, if preserved, so it was said by oracles, would ensure the ultimate restoration of their national existence. This Aristomenes buried secretly in the most desolate part of Mount Ithome, hoping that the gods who had hitherto favoured them would watch over this the last deposit of the hopes of his countrymen. One stormy night, when the vigilance of the Messenian sentinels was lulled by the violence of the tempest, and by the knowledge that Aristomenes, confined by a wound, was unable to exercise his usual superintendence, the Spartans, warned by a deserter, took possession of the walls. When the alarm was given, the Messenians flew to arms, and for three days maintained possession of the place. At length, being overmatched in numbers, and exhausted by constant fighting, they found it necessary to abandon the place. Aristomenes collected the survivors, and placing their women and children in the midst, demanded, by signs, a free passage. The Spartans opened their ranks rather than encounter the onset of such an enemy reduced to desperation.

The remnant of the Messenians took shelter with their faithful friends, the Arcadians. Bent on avenging his country, Aristomenes selected 500 men of approved courage,

and, in presence of the Arcadians, asked if they were ready to die with him, to obtain that end. All assented, and he disclosed his plan, which was to assault Sparta by night, while the army was still absent, and, if they could get possession of the city, to hold it as a pledge for the restoration of their own land; if not, to meet a glorious death. Three hundred Arcadians volunteered to join them; but the enterprise was frustrated by the traitor Aristocrates, who sent intelligence of it to Sparta. This time, however, his perfidy was detected, and he was stoned by his indignant countrymen. The Messenians, invited to join in the execution, looked towards Aristomenes, who sat weeping, with his eyes fixed on the ground; and we may infer, though it is not so stated in the story, that according to the old legend they withheld their hands.

The remnant that escaped from Eira, joined by the Messenians of Pylos and Methone, emigrated in a body, intending to seek the rich island of Sardinia, and they requested Aristomenes to put himself at their head. This he declined, saying, that he would never cease to war against the Lacedæmonians, and that he was sure some mischief would be continually accruing to them at his hands. In this hope he was disappointed. Damagetus, prince of Ialysus in Rhodes, being advised by an oracle to marry the daughter of the bravest man in Greece, selected Aristomenes as unquestionably deserving that title. Aristomenes went with his daughter to Rhodes, where he died, ungratified in his wish of striking another blow at Sparta. The exploits of Aristomenes formed the subject of a poem by Rhianus, in which the hero made as conspicuous a figure as Achilles in the poem of Homer. (Pausan. book iv. 6, &c.; Mitford, iv. 4: *Historical Parallels*.)

ARISTOPHANES, a celebrated comic poet of Athens, son of Philippus, or Philippides; his first play was exhibited on the Athenian stage B.C. 427, and his last, B.C. 388. There seems every reason to believe that he was a native of Athens, though Suidas brings him from the island of Rhodes, and others from Ægina, where he certainly possessed some property. (See Suidas, *Ἀριστοφάνης*, for the various opinions as to the place of his birth.) He had three sons, whose names are recorded. Of his private history, the few facts which have been transmitted are of little moment. Though the period during which he lived was full of transactions of great importance in the eventful history of Greece, Aristophanes does not appear to have been actively engaged in any of them. His life, in fact, was entirely devoted to literature, and the numerous plays which we know him to have produced prove that his attention could have been occupied with little else. He is the only writer of the old comedy of whom we have any considerable remains, and it is chiefly through his works that we are able to form an opinion respecting this particular species of dramatic composition. The writers of the old comedy sometimes brought real characters, without even a change of name, upon the stage. At first sight, the power thus assumed by them seems of a nature incompatible with the peace and security of society, but in reality it was not greater than that possessed by the public journals of the present day. The comic writer, in fact, may be considered to have supplied the place of the journalist of modern times; but with far inferior effect, as the times, at which the plays were represented, were at considerable intervals, and they could only be witnessed by a limited number. We believe, too, that they followed rather than led the opinions of the public, and that they did little more than give a more pointed expression and a somewhat wider circulation to the opinion already entertained of the individual whom they satirized, or of the class whom they held up to ridicule. Neither are we inclined to allow that they exercised much influence on the Athenians, or ever led to any important decision. It was the orator, and not the comic writer, 'who wielded at will the fierce democracy' of Athens.

Aristophanes was the author of fifty-four comedies (Suidas), of which eleven have been preserved. Suidas enumerates the same plays that we now possess, and mentions no others as being extant. In the fourth year of the Peloponnesian war, B.C. 427, the poet brought out his first play, entitled *Δαυλαίς*, holding up to public contempt the character of the spendthrift; and next year he produced the *Babylonians*, in which he attacked in no measured terms the demagogue Cleon, and the constituted authorities of Athens: of these plays we possess only a few fragments. His severe treatment of Cleon in the *Babylonians* is said to

have caused the demagogue to question the right of Aristophanes to be considered a citizen of Athens. Aristophanes was tried, and came off victorious by repeating the two verses put into the mouth of Telemachus by Homer, when he was asked whether he was the son of Ulysses: 'My mother,' replies Telemachus, 'says so, but I know not; for no person ever yet was sure as to his parentage.' (*Odys.* i. 215.) This story, which is told in an anonymous life of Aristophanes, as to the quotation from Homer, is rather a ridiculous one.

In 425, during the sixth year of the Peloponnesian war, he gained the first prize in a contest with Eupolis and Cratinus: his play was entitled the *Acharnians*, in which he recommended to the Athenians the cause of peace, as openly and as strongly as the nature of the people whom he addressed would permit. The scene lay chiefly in Acharnæ, one of the *demi*, or small towns of Attica; and the object he had in view was pointed out by introducing on the stage the rustic Dicæopolis, who, disapproving of the obstinacy of his fellow-citizens, had concluded with the Spartans a separate peace, and is exhibited in the full enjoyment of its fruits. The result of the opposite line of conduct is shown in the sufferings of Lamachus, who is exposed to the want of the first necessities of life, and writhing under severe wounds received in the field of battle. There is one scene in particular which is full of that comic humour for which Aristophanes is so distinguished. It is a sort of Amœbean dialogue between Lamachus and Dicæopolis. The commands of the former are those of a man preparing for a campaign; the responses of Dicæopolis are those of a person making ready for a convivial entertainment. This play contains a bitter satire on Pericles for his attachment to Aspasia, and at the same time a strong testimony to the vigour and eloquence of this great man. (*Acharn.* 524-534.)

Aristophanes had already made the demagogue Cleon writhe under his satire; but it was not till B.C. 424 that he poured forth upon him the full measure of his wrath. It was in that year that he produced the *Knights*, or, as Wieland more aptly designates it, the *Demagogues*, the most valuable, perhaps, of all his extant plays. He held up before the Athenian people a faithful picture of their own character with a boldness which we cannot but admire, knowing, as we do, that they allowed any one to be brought upon the stage except themselves. Athens is represented as a house, and its master is a stupid old gentleman, Demos (*people*): Nicias and Demosthenes are his slaves, and Cleon his confidential servant, or slave-driver; Agoracritus, a sausage-seller, is the person whose destiny it is to subvert the demagogue. Thus the dramatis personæ are few, and the plot is perhaps still more meagre. It consists of humiliating pictures of Cleon, and a succession of proofs to Demos that this favourite servant is wholly unworthy of the trust and confidence reposed in him. As an historical document, however, this play cannot be too highly valued, as furnishing a strong and faithful picture of one of the most singular nations of antiquity. It gives by no means a favourable view of their character. Demos is irritable, jealous, full of suspicions, a prey to superstition, fickle in his opinions, and inconstant in his pursuits; a curious mixture of acuteness and blindness, of insolence and servility. It is said that no one was found with sufficient nerve to act the part of Cleon, or to make a mask to represent him, and that Aristophanes was himself obliged to appear on the stage in that character with his face merely painted. The *Knights* was the first play that Aristophanes brought on the stage in his own name. There are many touches in Arbuthnot's *John Bull*, as Mitford remarks, strongly resembling the most striking traits in the character of Demos, the personification of the Athenians.

Next year, B.C. 423, he produced another play, the *Clouds*, which only gained the third prize, though in later times it has acquired a notoriety which it does not seem to have enjoyed at first. This arose, probably, from an idea first started by Ælian in one of his gossiping stories, that it was a main cause of the condemnation of Socrates (see also one of the Greek arguments to the play); but when it is known that the philosopher survived the satire of the poet for upwards of twenty years (Socrates died B.C. 399), nothing more is required to prove the untenable nature of such an opinion. Still it is probable enough that this play may have done serious injury to the true character of Socrates among the populace of Athens. It contains a powerful and severe attack on the schools of the sophists,

a race of philosophers who 'could make the worse appear the better reason'; but nothing, in our judgment, can justify the personal attack which the poet makes on Socrates, whose character, as far as we can form an opinion of it, was very different from that which is represented in the play. The plot is simple and clear; it is wrought up in a masterly style by a variety of comic incidents, and the characters are full of humour. Strepsiades is the most prominent; his rusticity strangely contrasts with the pedantry of the sophists. His son has ruined him by his extravagance, and he is willing to have recourse to any plan, however unprincipled, which he thinks likely to extricate himself from his embarrassments. He imagines that he has discovered a resource in the school of Socrates, by the sophistry and chicanery of whose doctrines he expects to be relieved from the dunning of his creditors. He presents himself before the philosopher, whom he finds suspended aloft in a basket; and the whole dialogue which follows between two characters so forcibly contrasted is conceived in the very best style of the author. At last, however, Strepsiades is convinced that his genius does not lie in that direction, and he determines to send his son Pheidippides to benefit by the philosopher's instructions. The youth makes great proficiency, which he shows in his dealings with his creditors and by beating his father, and then trying to convince the old gentleman that it is all right. The play closes with Strepsiades setting fire to the school-house of Socrates (*φροντιστήριον*), and burning out all the disciples; a significant hint, which, coupled with the concluding verses of the play, was well calculated to raise a religious persecution against Socrates. Cratinus, whom Aristophanes in his *Knights* had represented as sunk into a state of dotage, gained the victory over the *Clouds*. This play was caricatured by Eupolis, but it did not prevent the poet from labouring to improve his first idea, and it is probably the amended copy which we now possess. (See this point discussed by Wieland, *Att. Mus.* ii. 2; and by Hermann, *Præf.* xix.; see also the *Clouds* of Aristophanes, by F. G. Welcker.)

In B.C. 422 appeared the *Wasps*, an attack upon the jurisprudence of Athens, levelled chiefly at that numerous class of citizens who gained a livelihood by executing the office of *dicast*—an office somewhat resembling that of our Westminster special jurymen; but the parallel, to be complete, would require that the same special jurymen should be almost daily in attendance, and should be eager to discharge the duty. There cannot be said to be any plot. Philocleon is described as absolutely phrensied with that passion of which all his countrymen partook—a taste for litigation and frequenting the courts of law. His son Bdelycleon endeavours to reclaim him; but force, persuasion, and argument, are all tried in vain. The son is nearly driven to despair by the obstinacy and prejudices of his father, and at last falls upon a scheme which promises to extricate him from his difficulties. He proposes to convert his house into a court of justice, and to supply it with all suitable pomp. The old gentleman is pleased with the scheme, and the theft of a Sicilian cheese by a house-dog enables him to put it into immediate execution. To understand this play requires a minute acquaintance with the manners of the Athenians, and also with their judicial system. This play furnished Racine with the idea of his *Plaideurs*.

The play of the *Birds* was exhibited, B.C. 414, in the seventeenth year of the Peloponnesian war, and during the absence of the Salaminia, an official ship which was despatched to bring back Alcibiades from Sicily. (Thucyd. vi. 53. See *ALCIBIADS*.) Nearly every writer on this play, we believe, has found it almost impossible to say what is the leading idea of the plot; and consequently many critics have pronounced an unfavourable opinion on it. In the Transactions of the Royal Academy of Sciences of Berlin (1827) there is an essay by Sivers on the *Birds* of Aristophanes, the object of which is to demonstrate that the key to the true interpretation of the play is only to be found by referring to the date of the exhibition and the mission of the Salaminia. We understand that Mr. W. Hamilton is preparing a translation of Sivers's essay.

In B.C. 406 appeared the *Frogs*, in which Aristophanes attacks, with little generosity, the poet Euripides, who had lately died. Bacchus descends to the infernal regions in search of a good tragic writer, and after listening to a trial of skill between Æschylus and Euripides, decides that the merits of the former are far superior to those of the latter.

The best of his other extant works is the *Plutus*, which

appeared first in B.C. 408, and again twenty years afterwards, B.C. 388. It does not belong to the old comedy, nor does it appear to have any reference to political subjects, being intended probably to vindicate the conduct of Providence in its ordinary distributions of wealth, and to show the great tendency of riches to corrupt the morals of those who possess them. The choral parts of the *Plutus* are lost, or at least do not exist, and it contains no Parabasis. The other plays which have been preserved are the *Peace* (B.C. 419); *Thesmophoriazusa* (B.C. 411), an attack on Euripides, in which the plot is better managed than in most of the other plays; *Lysistrata* (B.C. 411); *Ecclesiazusa* (B.C. 392).

Aristophanes is distinguished by the exuberance of his wit, his inexhaustible fund of comic humour, and the Attic purity and great simplicity of his language. He introduces, when it suits his purpose, every variety of dialect, coins new expressions for the occasion, makes bad puns without ceasing, and displays, at the same time, all the riches and beauties of the Greek language. It must be confessed, however, that his wit is frequently of a kind which cannot be relished by the taste of the present age, partly because his allusions are sometimes necessarily obscure, and partly, also, because they are grossly obscene. Indeed, the indecency of his allusions and the indelicacy of his expressions can only be excused because it was the fault of the time and people among whom he lived, and others were probably worse than himself. The exact rank which he ought to hold among ancient comic writers it is difficult to assign, as none of their entire works have been preserved; but if we are inclined to trust the judgment of Plutarch, he was in every respect inferior to Menander, (vol. ix. p. 387, ed. Reisk.) Plato, however, is said to have had a high admiration of Aristophanes, and recommended the perusal of his plays to Dionysius the younger as the best mode of acquiring the purity of the Attic dialect. So fond, indeed, was Plato of his works, that they are said to have been found under his pillow after his death. (*Vit. Anonym.*)

The plays of Aristophanes, especially in the choral parts, often contain passages of great poetical beauty, but his subject did not allow such efforts to be either frequent or of any great length. We doubt, indeed, if he was capable of any continued effort of this description, as we observe a kind of mock solemnity in most of the poetical parts; and he could not long refrain from a joke, or some oblique stroke of satire. Where Aristophanes appears to be speaking in his own person, he is the advocate of morality, and the unsparing censurer of the gross and degrading habits of many of his countrymen. He was a friend to peace, and, to his credit, the enemy of Cleon. The real test of his character must be the *Clouds*. We do not see how it is possible to esteem the character of Socrates, and at the same time to believe that Aristophanes was an honest man. All the explanations and apologies with respect to this exhibition of Socrates appear to us unsatisfactory. Probably, like many wits of his own and subsequent ages, Aristophanes had neither the ability nor the turn of mind which would qualify him to investigate the principles of moral science, and he may have turned the philosopher into ridicule without knowing or caring what his doctrines were. Aristophanes often introduces the gods in the most degrading situations, and he makes an undisguised mockery of all the deities of Olympus. How this was tolerated, even in his age, it is difficult to understand.

There are numerous editions of the plays of Aristophanes. The first edition was printed at the Aldine press in Venice, 1498, fol., containing only nine plays. The *Thesmophoriazusa* and *Lysistrata* were wanting. The edition of Kuster contains the valuable Scholia. One of the most complete, containing a Latin version, an index, and a large collection of notes, is that of Bekker, in 5 vols. 8vo. Lond. 1829. Bekker's text is founded on the collation of two exceedingly good MSS., the Ravenna and the Venetian, which were unknown to the earlier editors. It contains also the Scholia. The valuable Scholia on Aristophanes have been lately published by Dindorf, 3 vols. Lips. 1826. The *Knights*, *Acharnes*, and the *Wasps*, have been translated into English verse by Mitchell (London, 1822); and the *Clouds*, more successfully, by Cumberland (1797). There are several prose translations of single plays; *Plutus*, by Fielding and Young; the *Birds*, by a Member of one of the Universities (London, 1812); *Acharnians*, *Knights*, *Wasps*, and *Birds*, by a Graduate of Oxford (Oxford, 1830). Aristophanes is

translated into French by Poinsinet de Sivry (1784), 4 vols. 8vo.; into German by Voss (Brunswick, 1821); and the *Clouds* and *Frogs* by Welker (Giessen and Darmstadt, 1810, 1812). Wieland translated the *Acharnes*, *Clouds*, *Knights*, and *Birds*. (See Ritscher, *Aristophanes und sein Zeitalter; eine Philologisch-Philos. Abhandlung zur Alterthumsforschung*. Berlin, 1827.)

ARISTOPHANES of Byzantium, the pupil of Callimachus and Zenodotus, the master of Aristarchus, and the founder of the Alexandrine school of criticism, was perhaps born about B.C. 240, or somewhat later. It is not known at what time he removed to Alexandria, but probably he went there young. (See Suidas, *Ἀριστοφάνης*.) The invention of the Greek accents is attributed to Aristophanes, and the introduction of a system of punctuation. He was the first who attempted to arrange the Greek writers into classes, according to the branches on which they wrote, separating those of the highest authority from writers of inferior merit. This canon of classical writers was afterwards corrected and confirmed by his pupil Aristarchus. The immense number of works already extant in that age rendered some critical enumeration and classification of them necessary, and perhaps we are indebted to Aristophanes and his more distinguished pupil, not only for the purer text, but also for the preservation of many of the best writers, which, if they had not been stamped with their approbation, might have been neglected for those of inferior merit. But it is also probable, as it has been remarked, that many writers of the second class fell into undeserved neglect, and ceased to be copied in consequence of being excluded from the canon. [See ARISTARCHUS.]

Nothing of Aristophanes remains except what may form a part of the large commentary of Eustathius, the Venice Scholia, &c. (See Villosion's *Scholia*, II. i. 298, 424, &c. where Aristophanes' edition of the *Iliad* is referred to.) Aristophanes wrote a work on *Συγγενικά*, or 'terms implying relationship' (see Eustath. II. z. p. 648; who also quotes other works written by Aristarchus). A mere fragment of Aristophanes is printed in Boissonade's *Ἐπιμετρητοὶ* of Herodian, 1819, 8vo.

See a passage in Atnenæus (book xiii. p. 583, Casaub.) apparently referring to a work by this Aristophanes.

ARISTOTLE (the Greek form of the name is Aristotéles) was born at Stageira (the name, before Aristotle's time, appears to have been Stageirus), a town on the west side of the Strymonic gulf in Chalcidice, in the first year of the ninety-ninth olympiad, or B.C. 384. Nicomachus, the friend and physician of Amyntas II., king of Macedonia, and the author of some medical treatises now lost, was his father; his mother was named Phæstis; and they both belonged to the

his father's relations with Amyntas appear, however, to have produced an acquaintance between him and Philip, the son of Amyntas, which was probably one of the reasons why that prince, when he had succeeded to the throne of Macedonia, chose Aristotle as the preceptor of his son Alexander. After the death of his parents, he was brought up under the care of Proxenus, a citizen of Atarneus, a city of Mysia in Asia Minor, but who was then settled at Stageira. Aristotle testified his gratitude to Proxenus and his wife by directing in his will that statues of them, as of his parents, should be set up at his expense: he likewise educated their son Nicenor, to whom he gave his daughter Pythias in marriage.

In his eighteenth year (Olymp. ciii. 2. B.C. 367) Aristotle left Stageira, and went to Athens, the centre of letters and learning in Greece, attracted thither doubtless in great part by the fame of the philosopher Plato. It appears, however, that during the first three years of his residence there Plato was absent on a visit to Sicily. There can be no doubt that Aristotle paid a particular attention to anatomy and medicine, as appears both from his extant and what we know of his lost writings; and it may be possible (as is indicated by some statements of ancient writers) that in his youth he practised, like Locke, the healing art: but he must from an early age have devoted his whole time to the study of philosophy and the investigation of nature, and have abandoned all thoughts of an exclusively professional career. His eagerness for the acquisition of knowledge, and his extraordinary acuteness and sagacity, doubtless attracted Plato's attention at an early period: thus we are told that his master called him *the intellect of the school*, and his house *the house of the reader*: that he said that Aristotle required the curb, while Xenocrates (a fellow-disciple) required the spur: some of which traditions are probably true. We are likewise informed that, when reading, he used to hold a brazen ball in his hand over a basin, in order that, if he fell asleep, he might be awaked by the noise which it made in falling. Although Aristotle did not, during Plato's life, set up any school in opposition to his master (as some writers have falsely stated), he taught publicly in the art of rhetoric, and by this means became the rival of the celebrated Isocrates [see ISOCRATES], whom he appears (although then at a very advanced age) to have attacked with considerable violence, and to have treated with much contempt. Cephaedorus, a disciple of Isocrates, wrote a treatise in four books to defend his master against Aristotle's attacks, in which he likewise charged that philosopher with degrading himself by the composition of a work on proverbs: whence we learn that Aristotle published some writings during the lifetime of his master.

Aristotle remained at Athens till Plato's death in B.C. 347, having at that time reached his thirty-seventh year. Many stories are preserved by the ancient compilers of anecdotes respecting the enmity between Plato and Aristotle, caused by the ingratitude of the disciple, as well as by certain peculiarities of his character which were displeasing to the master. But these rumours appear to us to have no other foundation than the known variance between the opinions and mental habits of the two philosophers; and particularly the opposition which Aristotle made to Plato's characteristic doctrine of ideas: whence it was inferred that there must have been an interruption of their friendly relations. The probability however is, that Aristotle, at whatever time he may have formed his philosophical opinions, had not published them in an authoritative shape, or entered into any public controversy, before his master's death: in his Nicomachean Ethics moreover, which was probably one of his latest works, he says, that 'it is painful to him to refute the doctrine of ideas, as it had been introduced by persons who were his friends: nevertheless, that it is his duty to disregard such private feelings; for both philosophers and truth being dear to him, it is right to give the preference to truth' (i. 6.). He is likewise stated to have erected an altar to his master, inscribing on it that he was a man 'whom the wicked ought not even to praise.' It has moreover been supposed that Aristotle was the author of the calumny, that Socrates had married a second wife during the lifetime of his first; but the charge rests on the inaccuracy of Diogenes Laertius, Plutarch, and other late writers, who have misrepresented a passage from Aristotle's work on Nobility, preserved in Stobæus, which treatise, it should be observed, is attributed to Aristotle on very doubtful authority. (See Luzac, *Lectiones Atticæ, De Digamia Socratis*, § 4.)

Bust of Aristotle, from a fine statue of the natural size in the Spada Palace at Rome, engraved in Maffei's work on the Statues of Rome, pl. 185. (See Visconti, *Iconographie Grecque*, vol. i. p. 186.)

race or clan of the Asclepiads, who were supposed to derive their origin from Asclepius or Æsculapius, the God of Healing, and of whose members many practised the medical art. Aristotle lost both his parents at an early period of his life:

It appears that during Aristotle's first residence at Athens he was employed on an embassy to Philip, to whom he was attached by a double tie, as being both a Macedonian subject and the son of his friend and physician. It is also stated that he was the means of obtaining from Philip some favours for the Athenians. His departure from Athens at the time of Plato's death may therefore not improbably have been caused by the enmity between Philip and the Athenians, which arose at that time from a successful attack on Olynthus by the former. It may likewise have originated from the circumstance that Speusippus, the nephew of Plato, and not Aristotle, succeeded him as head of the academy. However this may be, Aristotle, together with his fellow-disciple, Xenocrates, a man, as it appears, of very rare excellence, went at this time to the court of Hermias, the prince of Atarneus, who had previously received instruction in rhetoric from Aristotle at Athens, and now invited his former master to Asia Minor. Hermias was a eunuch, and had been the domestic slave of a banker; but having returned from Athens, where he received a liberal education under Plato and Aristotle, he succeeded with Eubulus in liberating from the Persian yoke Atarneus and the neighbouring territory, of which, after the death of Eubulus, he remained sole ruler. After Aristotle had resided three years at Assus, a town near Atarneus, Hermias fell into the hands of Mentor, a Greek general in the Persian service, by whom he was delivered to Artaxerxes Ochus, and by him put to death. Upon the death of their protector, Aristotle and Xenocrates fled from Assus, and the former took refuge in Mytilene, the chief city of the neighbouring island of Lesbos (Olymp. cviii. 4, A.C. 345). Aristotle moreover, seeing that Pythias, the sister of Hermias, would, if she were left behind, be exposed to the utmost misery, when the country came to be occupied by the Persian soldiery, and actuated not only by his friendship for Hermias, but also by the excellent character and disposition of Pythias, made her his wife, and saved her from the enemy by a rapid flight. (This account is given by Aristocles the peripatetic, from Aristotle's lost epistles to Antipater ap. Euseb. *Præp. Evang.* xv. p. 793, A. Strabo, xiii. p. 610, calls Pythias the niece of Hermias; perhaps she was his adoptive sister.) For the patriotic and philosophic prince, thus destroyed by the treachery of a Greek renegade, Aristotle had a fervent and sincere affection, and he dedicated to his memory a beautiful poem, still extant, which, on account of the admiration which he expresses in it for the virtues of his lost friend, gave rise at a late period of his life to the absurd charge that he had deified a mortal, and was thus guilty of impiety. His wife Pythias died a few years afterwards in Macedonia, leaving him a daughter of the same name: he then took to his bed a domestic slave named Herpyllis, and by her he had a son, Nicomachus, to whom he addressed his great work on Ethics.

After two years' stay at Mytilene, Aristotle was (in Olymp. cix. 2. A.C. 342) invited by Philip to Macedonia to superintend the education of his son Alexander, then fourteen years old. There can be no doubt that much of what was admirable in the character of Alexander the Great is attributable to the influence of Aristotle. His love of literature, his veneration of great poets (instanced in his sparing the house of Pindar in the destruction of Thebes, and his destination of the precious casket in the Persian spoils to the works of Homer), his fondness for physical and even medical pursuits, and his intimacy with philosophers, were all doubtless the fruits of Aristotle's instruction, and distinguish him most advantageously from those illiterate and brutal conquerors who have been the scourge of the human race. Lord Bacon, in his *Advancement of Learning*, after citing some of Alexander's wise sayings, adds, that he considers him 'not as Alexander the Great, but as Aristotle's scholar.' The same sentiment is likewise expressed in the following epigram:

Maximus hic regum, doctissimus ille sophorum,
Magnus Alexander, major Aristoteles,
Doctus Alexandrum meliorem reddidit ille,
Non hic majorem magnus Aristoteles.

Two letters between Alexander and Aristotle are preserved by Plutarch (*Vit. Alex.* c. vii.), and Aulus Gellius (xx. 5), in the first of which Alexander reproaches his master with having made public the treatises which had served for his education, as he wished to surpass other men not less in knowledge than in power. To this Aristotle replies, that 'they have been published and not published: for that they are only intelligible to those who have heard him

explain them.' Even if the suspicions of some writers that these letters are spurious should be approved, still there would remain no doubt of the important influence exercised by Aristotle on the mind of Alexander: it is likewise stated that he advised his pupil to consider all the Greeks as his friends, and all barbarians (or foreigners) as his enemies: a maxim of policy which Alexander unquestionably followed, so far as the direction of his conquests was concerned, and which agrees remarkably with Aristotle's views as developed in the first part of his 'Politics.' It was during his residence with Alexander that Philip re-established his native town, Stageira, which had been demolished in war; in memory of which benefit the Stagiritæ consecrated a festival, *Aristotelia*, to their great fellow-citizen, and called a month after his name.

Alexander probably did not enjoy Aristotle's instruction for more than three or four years: as from his seventeenth or eighteenth year his time was almost entirely occupied with public affairs and war. In A.C. 336, when Philip was assassinated, he succeeded to the throne of Macedonia, and two years afterwards he began his expedition into Asia, when he parted for the last time from his master, who went to Athens, having previously recommended to him as a companion in his campaigns a near relation of his own, the philosopher Callisthenes, who had received his instruction with Alexander. Xenocrates had two years before succeeded Speusippus in the academy; Aristotle, however, on his arrival at Athens, resolved to open a school, and chose a house which from its proximity to the temple of Apollo Lyceus was called the *Lyceum*. Attached to this building was a garden with walks (in Greek *peripatoi*), where Aristotle used to deliver his instruction to his disciples; whence his school obtained the name of the *Peripatetic*. It appears that his habit was to give one lecture in the early part of the day on the abstruser parts of his philosophy to his more advanced scholars, which was called the *morning walk*, and lasted till the hour when people drest and anointed themselves; and another lecture, called the *evening walk*, on more popular subjects, to a larger and less select class. It was probably during the thirteen years of his second residence at Athens that Aristotle composed or completed the greater part of his works which have descended to our days: the foundation of most of them was doubtless laid at an early period of his life; but they appear to have been gradually formed, and to have received continual additions and corrections. Among the works which especially belong to this period of his life are his treatises on natural history; which, as has been correctly observed by a late writer on this subject (Dr. Kidd, *Bridgewater Treatise, &c.*, p. 299), are not to be considered as containing the result of his own observations only, but as a collection of all that had been observed by others as well as by himself. It is stated by Pliny (*Nat. Hist.* viii. 7) that 'Alexander the Great, being smitten with the desire of knowing the natures of animals, ordered several thousand persons, over the whole of Asia and Greece, who lived by hunting, bird-catching, and fishing, or who had the care of parks, herds, hives, stews, and aviaries, to furnish Aristotle with materials for a work on animals.' We are likewise informed that Aristotle received from Alexander the enormous sum of 800 talents to prosecute his researches in natural history—a circumstance which did not escape the malice of his traducers, who censured him for receiving gifts from princes. (*Athenæus*, ix. p. 398 [comp. Boeckh's *Economy of Athens*, vol. i. p. 20]. Seneca *De Vita Beata*, c. 27. *Ælian*, *Var. Hist.* v. 19, who states that Philip furnished Aristotle with large sums of money for his history of animals, has doubtless confounded the father and son.) Callisthenes, who, as we have already seen, attended Alexander in his expedition to Asia, sent from Babylon to Aristotle, in compliance with his previous injunctions, the astronomical observations which were preserved in that ancient city, and which, according to the statement of Porphyrius, reached back as far as 1903 years before the time of Alexander the Great; that is, 2234 years before the Christian æra. (Simplicius in *Aristot. de Cælo*, fol. 123 A. l. 18, ed. Ald. 1527. The transmission of the observations to Aristotle is stated by Simplicius as a known fact: the length of time he gives on the authority of Porphyrius. See Bailly, *Histoire de l'Astronomie Ancienne*, liv. 4. éclaircissement, § 17-23. On Aristotle's astronomical knowledge, see Bailly, *ibid.* liv. 9. § 10, 11.) The fact that astronomical observations of considerable antiquity were sent from Babylon to Aristotle

(though they are nowhere mentioned in his extant writings) appears to be undoubted: the epoch from which they date is however uncertain, and is variously stated by ancient writers. (See Pliny, *Nat. Hist.* vii. 56. explained by Bailly, *ibid.* liv. 4. éclaircissements § 18.) We know from Cicero (*de Rep.* i. 16) that astronomical observations were sometimes calculated back by the ancient priests; and consequently that observations stated to be of remote antiquity may not be less fabulous than the adventures of early kings and heroes.

Aristotle had at this time reached the most prosperous period of his life. The founder and leader of the principal school of Greece, and the undisputed head of Grecian philosophy, surrounded by his numerous disciples and admirers, protected by the great conqueror of Asia, and by him furnished with the means of following his favourite pursuits and of gratifying his universal spirit of inquiry, he had probably little left to fill up the measure of a philosopher's ambition. But he did not continue to enjoy the favour of Alexander till the end. Callisthenes, by his free-spoken censures and uncourtly habits, had offended his master, and had been executed on a charge of having conspired with some Macedonian nobles to take away his life (see ALEXANDER and CALLISTHENES); and the king's wrath appears to have extended to his kinsman Aristotle, as being the person who had originally recommended him. (Letter of Alexander to Antipater in Plutarch. *Alex.* c. 55.) It is not, however, probable that this circumstance caused any active enmity between the royal pupil and his master; nor, even if we did not know to a certainty that Alexander died a natural death, would there be any reason for listening to the absurd calumny that Aristotle was concerned in poisoning him. Aristotle indeed appears to have been considered to the last as a partizan of Alexander, and an opponent of the democratic interest. When the anti-Macedonian party obtained the superiority at Athens in consequence of Alexander's death, an accusation against Aristotle was immediately prepared, and the pretext selected was, as in the case of Socrates, *impiety or blasphemy*. He was charged by Eurymedon the hierophant and a man named Demophilus (probably a leader of the popular party) with paying divine honours to Hermeias; and perhaps with teaching some irreligious doctrines. In order to escape this danger, and to prevent the Athenians (as he is reported to have said) from *twice sinning against philosophy*, in the beginning of B.C. 322 he quitted Athens, and took refuge at Chalcis, in Eubœa, an island then under the Macedonian influence, leaving Theophrastus his successor in the Lyceum. There he died of a disease of the stomach, in the autumn of the same year, being in the sixty-third year of his age. His frame is said to have been slender and weakly, and his health had given way in the latter part of his life, having probably been impaired by his unwearied studies and the intense application of his mind. The story of his having drowned himself in the Euripus of Eubœa is fabulous.

The characteristic of Aristotle's philosophy, as compared with that of Plato, is that, whereas the latter gave a free scope to his imagination, and by his doctrine of ideas independent of the objects which they represent opened a wide door to the dreams of mysticism, the latter was a close and strict observer of both mental and physical phenomena, avoiding all the seductions of the fancy, and following a severe, methodical, and strictly scientific course of inquiry, founded on data ascertained by experience. The truly philosophical character of his mind, and his calm and singularly dispassionate manner of writing, are not more remarkable than the vast extent both of his reading and of his original researches. His writings appear to have embraced the whole circle of the theoretical and practical knowledge of his time, comprising treatises on logical, metaphysical, rhetorical, poetical, ethical, political, economical, physical, mechanical, and medical science: he likewise wrote on some parts of the mathematics; and, besides a collection of the constitutions of all the states known in his age, both Grecian and barbarian, he made chronological compilations relating to the political and dramatical history of Greece. His works, however, though embracing so large an extent of subjects, were not a mere encyclopedia or digest of existing knowledge; some of the sciences which he treated of were created by himself, and the others were enriched by fresh inquiries, and methodized by his systematic diligence. To the former belong his works on analytics and dialectics, or, as it is now called, logic; to the invention of which science he distinctly

lays claim, stating that 'before his time nothing whatever had been done in it.' (*Soph. Elench.* c. 34. § 6.) Nearly the same remark applies to his metaphysical treatise. 'But of all the sciences (we use the words of Cuvier) there is none which owes more to Aristotle than the natural history of animals. Not only was he acquainted with a great number of species, but he has studied and described them on a luminous and comprehensive plan, to which, perhaps, none of his successors has approached; classing the facts, not according to the species, but according to the organs and functions, the sole method of establishing comparative results: thus it may be said that he is not only the most ancient author of comparative anatomy whose works have come down to us, but that he is one of those who have treated this branch of natural history with the most genius, and that he best deserves to be taken for a model. The principal divisions which naturalists still follow in the animal kingdom are due to Aristotle, and he had already pointed out several, which have recently been again adopted, after having once been improperly abandoned. If the foundations of these great labours are examined, it will be seen that they all rest on the same method. Everywhere Aristotle observes the facts with attention; he compares them with sagacity, and endeavours to rise to the qualities which they have in common.' (*Biographie Universelle, in Aristotle*. See also Kidd's *Bridgewater Treatise*, c. 10. § 3, and *Appendix*, who has given a more detailed comparison of Aristotle's account of animals with the discoveries of modern science.) Among the sciences which he found partly cultivated, but which he greatly advanced, the more prominent are those of rhetoric, ethics, and politics. Of rhetoric he defined the province and analysed all the parts with admirable skill and sagacity; his treatise on the passions, in this short but comprehensive work, has never been surpassed, if it has ever been equalled, by writers on (what may be termed) descriptive moral philosophy. His ethical writings contain an excellent practical code of morality, chiefly founded on the maxim that virtues are in the middle between two opposite vices; as courage between cowardice and foolhardiness, liberality between niggardliness and prodigality, &c.; his remarks on friendship are also deserving of especial notice; a subject much discussed by the ancients, but which has less occupied the attention of philosophers, since love has played a more prominent part in consequence of the influence of the Germans and the introduction of the manners of chivalry in western Europe. His treatise on Politics is not, like Plato's *Republic* and the works of many later speculators on government, a mere inquiry after a perfect state; but contains an account of the nature of government, of the various forms of which it is susceptible, and the institutions best adapted to the societies in which those forms are established; with an essay, though unhappily an imperfect one, on education. This treatise is valuable not only for its theoretical results, but also for the large amount of information which it contains on the governments of Greece and other neighbouring countries. Throughout these last-mentioned works, the knowledge of the world and of human nature displayed by Aristotle is very observable; and although his mind appears to have preferred investigations of physical and metaphysical science, yet he holds a very high place in the highest rank of moral and political philosophers. Aristotle, it will be remembered, did not lead the life of a recluse student, but, as the friend of Hermeias, the teacher of Alexander, and the head of a philosophical school, he was brought into contact with a great variety of persons, and learnt by practice to know life under many different forms and in many different relations.

In these philosophical treatises Aristotle occasionally mentions others of his writings, which he calls *exoteric*. From the manner in which he sometimes speaks of them referring to them on points of no great obscurity or difficulty with a sort of contemptuous or condescending tone it would seem as if they were not of a strictly scientific character. (*Eth. Nic.* i. 13; vi. 4. *Polit.* iii. 4; vii. 1.) In another place he says, that he has often considered the Platonic doctrine of ideas both in his exoteric and his strictly philosophical works (*Eth. Eud.* i. 8): with which Plutarch agrees, who states that Aristotle everywhere attacked this Platonic doctrine, as well in his ethical and physical works as in his *exoteric dialogues*. (*Adv. Colot.* vol. ii. p. 1115 B. comp. *Arist. Met.* xiii. 1.) From this passage it appears that some at least of Aristotle's exoteric works were composed in the form of a dialogue; Cicero likewise mentions the

circumstance when, in writing to Atticus on his dialogue *de Republica*, he says that 'he prefixes *proœmia* or introductions to each book, as Aristotle does in those works which he calls *exoteric*.' (*Epist. ad Att.* iv. 16. Other circumstances of Aristotle's dialogues are mentioned by Cicero, *Epist. ad Att.* xiii. 19. *Ad Fam.* i. 9.) His systematic treatises, which formed a connected body of philosophy, were called *acroamatic*, that is, destined for lectures (though he never himself uses that name in his extant writings); and were thus, as Galen says, confined to his scholars and friends. This distinction between his acroamatic and exoteric writings is mentioned by Gellius (*N. A.* xx. 5), who states that the former included subjects of a refined and abstruse philosophy, and physical and dialectical questions; the latter rhetorical and sophistical exercises and political knowledge. Ammonius (Ammonius Hermiæ, in *Aristot. Categ.* fol. 6 B. ed. Ald.), an ancient commentator on Aristotle, divides his works into those which he wrote in his own person, or acroamatic, and those which he wrote in the form of a dialogue, or exoteric: the latter, he adds, differ much from the former in the clearness of the style and the mode of reasoning employed in them. Simplicius (*Ad Aristot. Phys.* fol. 2 B.), another commentator, gives the same division into acroamatic and exoteric, and makes the same statement as to the popular nature of the latter; but under exoteric he includes Aristotle's historical works as well as his dialogues. To this difference Themistius (*Orat.* 26. p. 319) alludes when he says that some of Aristotle's works are obscure and hard of comprehension; but that others are perspicuous, fitted for general readers, and written in an attractive and ornamented style. The statement above quoted from Gellius that Aristotle's scientific and popular treatises were distinguished by their subjects is probably not quite correct: doubtless everything discussed in the latter was included in the former, though perhaps treated in a more summary and abstruse manner. Their difference appears to have consisted chiefly in the form of the work (most of the exoteric writings being dialogues), in the selection of the arguments, and in the nature of the style. Cicero particularly speaks of the copiousness and sweetness of Aristotle's diction (*Topica*, c. 1); and Quintilian doubts whether Aristotle is the more remarkable for the multiplicity of his knowledge, the quantity of his writings, *the sweetness of his style*, the acuteness of his discoveries, or the variety of his works (x. 1. 83): in his extant works, however (all of which belong to the acroamatic class), his style is in most parts singularly dry and unattractive, and not unfrequently obscure, from the extreme conciseness of the expression and the abruptness of the transitions. It seems, indeed, as if he was sometimes intentionally negligent, and even ungrammatical, from his contempt for all ornament or polish of style. These peculiarities of style are doubtless attributable to the destination of his philosophical writings, which often appear to be rather note-books for his lectures, requiring further expansion and illustration, than finished treatises prepared for publication. This character may be particularly seen in the *Rhetoric* and the *Analytics*; in others, as in the *Nicomachean Ethics*, it is much less apparent. In general, however, all the chief steps of an argument are stated, though sometimes they are only intimated; and the obscurity of Aristotle, which has been so much complained of, is in most parts like the obscurity of a mathematical treatise, which appears so great to a beginner; as in both cases the difficulty of comprehension arises not from the defect of the expression, but from the closeness and subtlety of the reasoning. The works which were thus used as lecture-books probably never obtained much circulation during Aristotle's lifetime, except among his disciples and friends; and they received from time to time additions and corrections; a circumstance alluded to by Cicero, and confirmed by allusions contained in them, which indicate different times of composition. (*Cicero de Fin.* v. 5. Niebuhr, *Hist. of Rome*, vol. i. note 30.)

None of Aristotle's exoteric writings have come down to us; all his extant works belong to the acroamatic or strictly scientific class. This would be the more singular, if the story told by some ancient authors with regard to the preservation of his writings were true. It is stated by Strabo that Theophrastus, to whom Aristotle had bequeathed his library, left all his books to Neleus, who removed them to Scepsis, a town in Asia Minor; from him they passed to his descendants, who, being ignorant persons, kept the books

locked up, and took no care of them. Afterwards, hearing of the eagerness of the Attalian kings, in whose dominions Scepsis was situated, to collect a library at Pergamus, they hid them in a cellar, where they were injured by damp and moths; at last the family sold them to Apellicon of Teos, at a high price, who, being fonder of books than reading, and seeking to supply the defects of his manuscripts, filled the chasms unskilfully in the copies which he caused to be made, and published the works full of errors. Immediately after the death of Apellicon, Sylla, at the capture of Athens, brought his library to Rome; where Tyrannion, the grammarian, made use of them, as also some booksellers, who increased the number of errors, by employing careless transcribers. Strabo adds, that the Peripatetic school after Theophrastus had scarcely any of Aristotle's works, except his exoteric writings; and they followed no accurate and systematic study of philosophy (xiii. p. 608). Such is the substance of Strabo's account, which is in part confirmed by Plutarch (*Sylla*, c. 26) and Athenæus (i. p. 3); but the researches of recent scholars have shown that this narration deserves little faith; inasmuch as it appears that nearly all Aristotle's scientific works were known to the followers of Theophrastus in the Peripatetic school, and that there were numerous copies of them in the Alexandrine library; all which and other facts, which we have not space to notice, are inconsistent with the supposition that Aristotle's philosophical works were concealed from the world till the time of Apellicon, more than two hundred years after his death. The text of most of his extant works moreover bears no marks of the supplements of unskilful revisers or of chasms caused by the decay of manuscripts; this, however, is not the case with all; the *Poetic*, for instance, has come down to us in a mutilated form, and in many parts of the *Politics* the text has suffered severely.

Aristotle's genuine extant works may be divided into three classes: 1. Those relating to the philosophy of the mind. 2. Those relating to the physical sciences. 3. Those relating to moral and political philosophy. To the first class belong the *Metaphysics*, the *Categories*, the treatise on Interpretation, or the Meaning of Propositions, the first and second *Analytics*, the *Topics*, and the work on the Refutation of Sophistical Arguments, which, with the exception of the first, obtained the name of his *Organon*, or instrument for the analysis of reasoning. Several of his logical works are lost, particularly his *Methodics*, or treatise on Method, in eight books. (See *Rhet.* i. 2. 10.) To this head may be referred, though with less propriety, his *Rhetoric* and *Poetic*: the last of which works is imperfect. Under the second class come the *Physics*, the *Treatises on the Heavens*, on Generation and Destruction, on the Soul, on Sensation and the Objects of Sense, on Memory and Recollection, on Sleeping and Awaking, on Dreams and Prophecy in Sleep, on Length and Shortness of Life, on Youth and Old Age, on Life and Death, on Breathing: on the last subject there is also another short treatise. There is likewise a treatise on Colours, and an extract from a work on Sounds. The *Physiognomics* is a treatise on the marks of character in the outward person. The title of his great work on Natural History means, literally translated, *Inquiries concerning Animals* (*περί τῶν ζῴων ιστορίαι*). To this are annexed treatises on the Generation of Animals, on the Motion of Animals, on the Parts or Members of Animals, and on their mode of Walking. There is also a work on Meteorology, two books on Plants (which is a retranslation from a translation), a short essay on Mechanics, and a treatise on Indivisible Lines, which latter partly belong to mathematical science. A long collection of Problems, chiefly on physical subjects, with which Cicero was acquainted (*Tusc. Disp.* i. 33, comp. *Probl.* xxx. 1), has also been preserved. Under this head may be likewise mentioned a treatise on the Doctrines of Xenophanes, Zeno, and Gorgias, attributed to Theophrastus in a MS. collated by Bekker (vol. ii. p. 974): it appears, however, from Diogenes Laertius, that Aristotle wrote on these subjects. To the third class belong the three ethical treatises, the *Great*, the *Eudemian*, and the *Nicomachean Ethics*, which seem to have been written at different periods of his life, the first being the most meagre, and the last, addressed to his son Nicomachus (in which three books of the *Eudemian Ethics* are embodied), the most complete and matured. There is a short abstract of part of Aristotle's ethical system, called a treatise on the Virtues and Vices, which may, perhaps, be genuine: some ethical questions are also treated in the *Problems* (c. 27-30). The *Politics* are intended as a conti-

uation of the Nicomachean Ethics: the genuine *Œconomica* are lost, unless the first book of the treatise attributed to him (which is on Domestic, not Political Economy) is an abridgment of them by Theophrastus. (See *Philological Museum*, part i.)

The most valuable of Aristotle's lost works, and indeed the most valuable of all the lost works of Greek prose, is his collection of 158 Constitutions, both of Grecian and Barbarian States, the Democratic, Oligarchical, Aristocratical, and Tyrannical being treated separately, containing an account of the manners, customs, and institutions of each country. (Cicero, *De Fin.* v. 4.) The loss of his works on Colonies, on Nobility, and on Royal Government; of his Chronological Collections, and of his Epistles to Philip, Alexander, Antipater, and others, is also much to be regretted. He likewise revised a copy of the *Iliad*, which Alexander carried with him during his campaigns in a precious casket: hence this recension (called the *casket-copy*) passed into the Alexandrine Library, and was used by the Alexandrine critics. (Wolf, *Proleg. ad Homer.* s. 45.) His entire works, according to Diogenes Laertius, occupied in the Greek manuscripts 445,270 lines.

Writings contained in the collection of Aristotle's works falsely attributed to him are, the treatise on the Universe (*περί κόσμου*), the author of which (Mr. Payne Knight remarks) has 'retailed the common opinions of his age in the common language of a common declaimer, and by a strange inconsistency attributed them to the condensed, refined, and abstruse Stagiritæ' (see also Lord Aberdeen on *Grecian Architecture*, p. 207): the Rhetoric to Alexander: the second book of the *Œconomica*, and a treatise on Marvellous Reports, written between the time of Agathocles and the first Punic war, probably about the 130th Olympiad, or B.C. 260. (Niebuhr, *Hist. of Rome*, vol. i. p. 16, and note 342.) An extract about Winds, from Aristotle on the Signs of Bad Weather (*περί σημείων*, vol. ii. p. 973, ed. Bekker, omitted in the Table of Contents) is considered by Niebuhr as spurious. (*Hist. of Rome*, vol. i. p. 15.) It appears, however, that Aristotle wrote a treatise on this subject. (*σημεία χειμώνων*, Diog. Laert. v. 25, *σημασία χειμώνων*, *Anon.* vol. i. p. 64, ed. Buhle; see Theophrastus, vol. i. p. 782, ed. Schneider.) The genuineness of part of the Physiognomics has likewise been doubted. (See Müller, *Archäologie der Kunst*, s. 331, n. 1.) A set of Epistles is also attributed to Aristotle, which, like those of Phalaris, Socrates, Euripides, and others, are all spurious.

Aristotle's philosophical works many centuries after his death obtained a prodigious influence, not only in Europe, but even in Asia: they were translated into Arabic, and from thence an abstract of his logical system passed into the language of Persia. (See Balfour in the *Asiatic Researches*, vol. viii. p. 89-135, ed. 8vo. London.) In Europe they acquired an immense ascendancy in the middle ages, and were considered as an authority without appeal, and only second to that of Scripture: we are even informed that in a part of Germany his Ethics were read in the churches on Sunday in the place of the Gospel. Parts of his philosophy, which are the most worthless, as his Physics, were much cultivated; and his logical writings were in many cases abused so as to lead to vain subtleties and captious contests about words. The connexion between some of his philosophical tenets and the Roman Catholic theology tended much to uphold his authority; which the Reformation lowered in a corresponding degree. His doctrines were in general strongly opposed by the early reformers: in 1518 Luther sustained a thesis at Heidelberg, 'Qui in Aristotele vult philosophari prius oportet in Christo multificari.' *He who wishes to philosophise in Aristotle must be first stultified in Christ.* (Bayle, in *Aristotle*, n. Y. See also a curious passage of Luther's, containing a most scurrilous attack on Aristotle, cited in Bayle, *Luther*, n. II.) Luther gave way afterwards, and did not oppose Aristotle as to human learning. Melancthon, who was, however, one of the mildest of the reformers, was a great supporter of Aristotle. (See, among his other works, his *Moralis Philosoph. Epitome*, Argentor. 1539; with the introductory address, and the commentary on the fifth book of Aristotle's *Ethics*.) Many of his doctrines were in the same century zealously attacked by Pierre de la Ramée [see RAMUS], a French philosopher; and Bacon afterwards, with others of his followers, added the weight of their arguments and authority. Aristotle's philosophy accordingly fell into undeserved neglect during the latter part of the

seventeenth and the whole of the eighteenth century: of late years, however, the true worth of his writings has been more fully appreciated, and the study of his best treatises has much revived.

The best edition of Aristotle's entire works is that by Bekker, 1831, Berlin, 3 vols., quarto, in which the text is established on the authority of more than 100 MSS. of Italy, France, and England. Two volumes containing extracts from the Greek commentators, edited by Brandis, will complete the work. A cheaper and smaller edition has been recently published by Tauchnitz at Leipzig. Among the numerous editions of his separate works, the most worthy of notice are those of the *Metaphysics*, by Brandis; of the *Organon*, by Buhle; of the *Rhetoric*, by Gaisford; of the *Poetic*, by Tyrwhitt, Hermann, and Gräfenham; of the *Nicomachean Ethics*, by Zell and Cardwell; of the *Politics* and *Œconomica*, by Schneider and Götting; of the *History of Animals*, by Schneider; and of the spurious treatise *De Mirabilibus*, by Beckmann.

The English translations of Aristotle are, for the most part, of little value, on account of their unfaithfulness and inaccuracy. That of the *Poetic*, by Twining, should, however, be excepted. A translation of all Aristotle's works, by Mr. T. Taylor, was published in 9 vols., quarto, London, 1810, but the large amount of the price and the small number of the copies printed have confined the knowledge of this work within very narrow limits.

On Aristotle's life, see the ancient biographies prefixed to the first volume of Buhle's edition, and Stahl's *Aristoteles*, 2 vols., Halle, 1830 and 1832. On his speculative doctrines, see the historians of philosophy, Brucker, Tennemann, and particularly Ritter, vol. iii. p. 3-395. On the effect of his writings on philosophy and religion in the middle ages, see Launoy, *de Varia Aristotelis Fortuna*: Bayle's article on *Aristotle*; Jourdain, *Recherches sur l'Age et l'Origine des Traductions Latines d'Aristote*; and Hampden's *Bampton Lectures*; and on all these subjects, see Fabric. *Bibl. Græc.* vol. iii. p. 195-408, ed. Harles.

ARISTOXENUS of Tarentum, the earliest of the great Greek writers on music. He was a disciple, first of his father Mnesias, who was acquainted with music, and subsequently of Aristotle, but, according to Suidas (*ἀστρολόγος*), never spoke well of his great master after the latter had appointed Theophrastus as his successor. On the same authority it is stated that he wrote 453 treatises on music, philosophy, history, &c. This is all we know of his life, except that he is the author of a work on the Elements of Harmony, and the founder of a musical sect, usually called Aristoxenean, in opposition to the Pythagorean. The disciples of the former were also called *ποσειστικοί*, what should here be translated *musicians by ear*, in opposition to *κατασκευαστικοί*, as the latter were termed, that is, *musicians by rule*. As this controversy not only excited much attention, but various writings on both sides have descended to us, we will endeavour to give a slight notion of the merits of it, so far as that can be done without inflicting on our readers the repulsive details of the Greek musical theory. The matter is of no great general interest, since, of all the fine arts, music is the only one in which Greece has not erected a lasting memorial of herself. Aristoxenus, indeed, is cited by Vitruvius as the representative of music in the same sentence with Apelles as that of painting, yet there are but few musicians who even know his name.

The Pythagoreans had discovered the simplicity of the ratios [see ACOUSTICS] which exist between the notes of the diatonic scale. Founding their notions entirely upon arithmetic, they laid down intervals, as concordant or discordant, by theory alone, even to the extent of rejecting the interval of an eleventh from among the consonances, though of course they retained the fourth. They had also discovered the unequal intervals which exist between the tones of the scale, and, had they considered different keys, would have been obliged to invent a method of temperament. In the entire rejection of the ear they were undoubtedly wrong; and Aristoxenus was equally so in taking the other extreme. The latter maintains that the ear and judgment are not sufficiently sufficient, but that 'those who reject the senses as not accurate enough, but help them by reasoning, and who stand up for numerical proportions and ratios of velocities as the causes of gravity or acuteness, not only use means foreign to the matter, but produce results absolutely contrary to the phenomena.' He asserts that the octave consists of six whole tones, each of them equal to the interval between the

fourth and fifth to the tonic; that the fourth consists of two such tones and a half, the fifth of three and a half. It is now sufficiently known, that this system is erroneous even in the judgment of the ear, and that the only mark of musical tact displayed in it is the determination of the tone, not from the unassisted ear, though on its principles that would be admissible, but from the previous determination of a fourth and fifth. Six whole tones are more than an octave, and three different tones would be derived from the octave, fourth, and fifth, as defined by Aristoxenus. To put it in the power of any one to try his system, we subjoin the number of parts out of a thousand which each note requires; that is, calling the length of the string which sounds C, 1000, the length (tension being the same) corresponding to the several notes appears underneath them.

System of	C	D	E	F	G	A	B	C
Aristoxenus	1000	891	794	749	667	595	530	500
Perfect Intervals	1000	889	800	750	667	600	533	500

Of course the system of Aristoxenus is, so far as it goes, that now known by the name of *equal temperament*, which Dr. Smith (a stern theorist) prefers to all others, but which we trust will never be in common use, as its first principle is the abolition of all distinction between the characters of the different keys. The above is not on the exact principle of Aristoxenus, which cannot be represented, because it disagrees with itself; but the *practical* truth of the fourth and fifth of its scale (a mere accident) brings the preceding representation very close to it.

The system of Aristoxenus had its followers till the time of Ptolemy, who wrote against it in his *Harmonics*. One of the two treatises attributed to Euclid is Aristoxenean, but the other decidedly the reverse. Theon mentions both sects; and, if we may use the term, quizzes both, but asserts that they might do good by uniting their principles.

There is an opinion attributed to Aristoxenus, that the soul bears to the body some such relation as the sound of a string to the string itself: this is perspicuous poetry, but rather cloudy philosophy. (See Tenneman, *Manuel*, &c. Cousin's translation, who cites G. L. Mahne, *Diatr. de Aristoxeno Philos. Peripatetico*, 8vo. Amsterdam, 1793.)

The editions of Aristoxenus which we find noticed, are the following; *Aristoxeni Musici Antiquiss. Harmonicorum Element.* libri iii. &c. ab Ant. Gogauno Grauiensi, Venet. 1562; Latin only. The first Greek text appears to be, *Aristoxenus, Nicomachus, Alypius*, by J. Meursius, Leyden, 1616; *Antiquæ Musicæ Auctores septem*, Gr. et Lat. a Marco Meibomio, 2 vol. 4to. Elzevir, 1652. The fragments of the book on Rhythm were published for the first time by J. Morelli, Venice, 1785, 8vo. For further information, refer to Hawkins's *Hist. of Music*; Montucla, *Hist. de Math.*; Wallis, Appendix to his edition of *Ptolemy's Harmonics*; Gregory, Preface to his edition of *Euclid*.

ARITHMETIC, from the Greek ἀριθμητική (*arithmētikē*), 'the art of numbering,' should mean the science of number in general, including a great part of what is commonly called *algebra*; it is, however, usually restricted to mean only the science of the expression of numbers by symbols, and the application (not investigation) of all rules relating to them which are useful in the arts of life. Agreeably to the plan which we have laid down for the treatment of general terms (see ACOUSTICS), we shall here confine ourselves to the elucidation, philosophical and historical, of the method of naming and representing numbers; in doing which we shall refer to such other articles as will, all together, furnish the most complete view of the subject our work can afford. For the method of applying principles in practice, see the names of the various rules, ADDITION, SUBTRACTION, &c. For the account of what we must call the metaphysics of arithmetic, see NUMBERS; and for the history of this branch, see PYTHAGORAS, PLATO, THEON, EUCLID, DIOPHANTUS, FERMAT, &c.; for that part of algebra which particularly concerns pure arithmetic, see NUMBERS, THEORY OF; for the arithmetic of concrete numbers, see WEIGHTS and MEASURES, and such articles as YARD, POUND, &c.

All the information hitherto possessed on the main points of arithmetical history (and a great deal more) has been lately presented to the world in so complete a shape, that it would be little better than affectation to make any more references than one, in an article which has no pretensions to original research. Of course we allude to Mr. Peacock's *History of Arithmetic* contained in the *Encyclopædia Me-*

tropolitana, which is certainly the most complete treatise yet written on any one point of mathematical history. In using this work as our universal reference, we regret that our limits will not allow us to make such a formal abstract of it, as would oblige us to ask the permission of its owners before we published this number. But as the Treatise itself is of a length answering to more than eighty pages of this Cyclopædia, such an account of its contents would be impossible; and we therefore use it only as authority for citations of fact, in which we shall refer to the paging of the *Encyclopædia Metropolitana*. We, however, feel bound to bear testimony to its correctness on all points which our access to books has enabled us to investigate.

We find ourselves in possession of a method of representing numbers so simple and powerful, that the principle and practice of the most complicated rules follows from it with ease. It is so well known that we need not explain it; but when we separate from the rest the part which particularly distinguishes our *Numeration* from that of the antient Europeans, we shall find that our superiority consists in the adoption of the following conventions.

1. The value of a figure depends not only upon the simple number for which it stands when alone, but upon the place in which it stands. Thus, in 888 the three eights mean eight, eight tens, and eight hundreds.

2. The place of a figure, considered as affecting its value, is determined by the column in which it stands, and in the absence of succeeding figures to indicate the existence of other columns, their place is supplied by ciphers, which of themselves are considered as having no value. Thus the 8 in 800 is of the same value as that in 863.

To complete our particular system, on which, however, none of its advantages depend, we must add that each figure is increased *tenfold* for every place which it is removed to the left. In the first two conventions consists what is called the 'local value' of the figures; in the last is found the reason for the term 'decimal notation,' from the Latin word, *decem*, ten.

There can be no doubt that the mere decimal notation, which has been in use in almost every age and country, has arisen from the facility which the ten fingers afford for making calculations. The names of numbers have been almost universally formed distinct as far as ten, after which compound names have been employed. The exceptions to the rule are additional proofs of the generality of the principle; they are either deduced from five or from twenty, the number of fingers on one hand, or the number of fingers and toes together. We call the simple symbols of numbers *digits*, or fingers; the Caribbees call the number ten by a phrase which signifies 'all the children of the hand' (Peacock, 390); and in many languages the phrases for five, ten, and twenty, are connected, either by direct derivation or common etymology, with those for the hand or fingers. In France the scale from 60 to 100 is strictly vicenary (by twenties), and in the Indian archipelago the antient scales are vicenary. For more discussion on this point, we refer to NUMERALS. We shall here only quote two results of observation, as laid down by Mr. Peacock (371), which appear to be very well borne out. They are, that 'the natural scales of numeration alone have ever met with adoption,' meaning, by natural scales, those derived from the hands, or hands and feet; and that 'amongst all nations practical methods of numeration have preceded the formation of numerical language.'

But this does not mean that every nation has gone high in the scale of numbers. There are tribes which have never even risen to a *quinary* scale (by fives), owing to their never wanting, and therefore never giving names to, numbers as high as five. Aristotle (P. 391) mentions a tribe of Thracians which never counted higher than four; and the Yancos on the Amazon have been stopped by the complexity of their language. They count no higher than three, the name for which, in their language, is (P. 390), according to La Condamine, *Poettarrarorincoaroc*.

One of the Abipones, in describing a number of men greater than ten, would mark out a space of ground sufficient to contain them. This is, in its principle, the same resource as that to which the Greeks were driven by their cumbersome notation, viz., the substitution of geometry for arithmetic. [See SQUARE, EUCLID.]

To enable our reader rightly to estimate the advantage which we possess in our notation, we will here describe that of the Greeks, which is only equalled by that of the Chinese

in its near approach to the Indian, or generally received system, and is very much superior to that of the Chinese in the simplicity of its symbols. We shall omit the substitution of letters for numbers, and content ourselves with abandoning the principle of 'local value,' and substituting in its place such a system of symbols as, without departing from the *principle* of Greek notation, will not confuse the reader by the adoption of new digits. For the actual signs used by the Greeks, see NUMERATION, NUMERALS. Let the first nine numbers be represented as usual, but let *ten* (instead of 10, in which 1 has local value) be represented by 1', twenty by 2', &c. Let 1'' be one hundred, 2'' two hundred, and so on; 1''' one thousand, 2''' two thousand, and so on. Let M stand for ten thousand, and let M affixed to a number make its value ten thousand times as great; thus, 4'2M is 420,000 in our notation. We have here improved upon the system of the Greeks, unavoidably, in order not to confuse the reader, since 2000, 200, 20, and 2, would not among them present to the eye that analogy which exists between 2''', 2'', 2', and 2, being in fact denoted by

β , σ , κ , and β .

We now write some high numbers in our own decimal scale, accompanied by our imitation of the Greek.

46379268 4'''6'''3'7M.9'''2'''6'8
6007.0030 6'''7M.3'
72007.106 7'''2'''M.1'''1'6

In the first number, *where there is no cipher*, the Greek looks so like our own, that we might be led to imagine there was no essential difference. We might say, that as it would be natural, and was in fact usual, to write the higher numbers first, the mere occurrence of a fourth column would suggest the idea of thousands, so that a notion, which we must call one of *local value*, would be inevitably formed. And perhaps it was so: indeed it is surprising that neither Archimedes, Apollonius, or Diophantus, ever detected and improved the idea. But when we come to look at the second and third number, we see immediately that the continual derangement of the columns would prevent this notion from acquiring consistence. The symbol of *vacuity* is wanting; and we cannot see how great an impediment that defect presented, because we learn 20, 30, &c., as soon we learn *twenty*, *thirty*, &c. And though perhaps 2', 3', &c., might have suggested such a contrivance, yet there was no analogy between κ (20) and λ (30) and β (2) and γ (3).

The ingenuity both of Archimedes and Apollonius was employed in the extension of the preceding system, without alteration of its principle. That of the latter we shall imitate. Calling 10,000 M₁, let ten thousand times ten thousand be called M₂, ten thousand times that number M₃, and so on, and let any one of these placed immediately after a number mean that the preceding is to be taken ten thousand times if followed by M₁, ten thousand times ten thousand if by M₂, and so on. The following number

1768,9360,0142,0193

would then be represented by

1'''7'''6'''8M₃.9'''3'''6'M₂.1'4'2M₁.1'9 3

on which we may make the same remarks as before. The method of Archimedes (which preceded this) differed from it only in making ten million the *rudix* of the system. We now see why our arithmetic was called *ciphering*, cipher coming from an Arabic word signifying *vacant*. One such thought as occurred to Archimedes in the bath (see ARCHIMEDES) might have been fourteen centuries gained to the science.

We look in vain for anything like local value in the system of the Egyptians, or any other nation of antiquity who are known with *certainly* to have very antient records. That of the Jews was similar to the one just described, so far as it went, and the use of some letters common to both (P. 406) in the numeral system, but not so in the *alphabets* of the two, proves that the notation of both had a common source. [See NUMERALS.]

To the same article we must also refer for the Roman system, which extended itself throughout Europe during the first twelve centuries. It is much more rude than the Greek, and is a sufficient proof of the well known inaptitude of the former people for scientific invention.

The Chinese had several systems of numeration, all containing complicated symbols, and somewhat resembling that

of the Greeks in principle; but with this important difference, that the symbol for 30, for example, has direct analogy with that for 3, being made by the juxtaposition of a symbol for ten; so that the improvement upon the Greek scale which we have been obliged to make in order to explain it, renders our imitation of the Greek a better resemblance of the Chinese. But they have no written method of expressing local value; though their *Schuan-pan* [see ABACUS] is a practical use of the principle.

Before we proceed to the history of our own scale, we must extend our remark, that the 'decimal notation' and 'system of local value' are distinct things. When we agree that 10 shall stand for ten, we merely express that a number in the second column from the right shall stand for ten times as much as the same in the first column. But we are at liberty to suppose that a number in the second column shall mean nine, eight, or any other number of times what it does in the first. Thus, if we choose a *quinary* scale, in which 10 stands for 5, we reject the symbols 5, 6, 7, 8, and 9, and our numerical scale runs thus—

1	2	3	4	10	11	12	13	14	20	21	22	&c.
one	two	three	four	five	six	seven	eight	nine	ten	eleven	twelve	&c.

Thus 20 is *ten*, because 2 in the second column counts five times 2. But if we choose a higher scale than the decimal, we shall have to invent, instead of rejecting symbols; if, for instance, we take a *duodenary* scale, in which 10 means twelve, we are left without symbols for *ten* and *eleven*. Let *t* and *e* stand for these; then our scale of number, beginning from ten, is as follows:—

t	e	10	11	12	13	14	15	16	17	18	19	1t	1e	20	&c.
ten	eleven	twelve	thirteen	fourteen	fifteen	sixteen	seventeen	eighteen	nineteen	twenty	twenty-one	twenty-two	twenty-three	twenty-four	&c.

But the scale which best exemplifies the principle is the binary, in which 10 stands for 2, and in which there are consequently no symbols except 1 and 0. The system of numbers in this scale (from one to ten) is as follows:—

1	10	11	100	101	110	111	1000	1001	1010
---	----	----	-----	-----	-----	-----	------	------	------

A Jesuit at Pekin (P. 392) communicated to Leibnitz the following Chinese symbol, called by them the *Cova*, or *lineation*, and attributed to Fohi, the founder of the empire. It is suspended in their temples, and considered as a mystery—

— — — — —
— — — — —
— — — — —
— — — — —

If the long line be interpreted to mean *one*, and the broken line *nothing*, these symbols, each being read from the bottom to the top, give a system of binary arithmetic from 0 to 7 (both inclusive). And Leibnitz asserts that there is a larger *Cova*, which goes up to 63. But as no additional information has been obtained upon the subject, which for anything certainly known to the contrary, may be a hoax, we can only say that there is some presumption that the Chinese long ago possessed the complete principle of the 'local value.'

We trace our own knowledge of the decimal system direct to the Hindoos, who themselves ascribe it to the divinity. As to the manner of its introduction, there are some differences of opinion on that subject. One and the old account is, that Gerbert, after Pope Sylvester II., found it in Spain among the Moors (P. 415) in the latter part of the tenth century. But upon this there are strong reasons for hesitating. [See SYLVESTER II.] Another, and more probable account is, that Leonard of Pisa [see BONACCI and ALGEBRA] introduced it, in 1202, in a work entitled *Liber Abaci*, &c. And some have supposed that the *Almon* (or Alphonsine) *Tables*, being constructed principally by Moors at the court of Alonso, must have been the first in which the system appears. (P. 413.) It is certain that this system had been before the twelfth century, and most probably as early as the ninth, in the hands of the Persians and Arabs, who ascribe it to the Hindoos, and call it by a name which signifies 'Hindoo science.' It is also certain that the Hindoos themselves have long used it (see BIRAGANITA and LILIWATI, names of Hindoo works), and that it is easy to trace the manner in which our numeral symbols have been derived from those of the Sanscrit. In this latter language there are distinct names for *units*, *tens*, &c. up to

what we should call *hundreds of thousands of millions of millions*. But whether we are to look to a Hindoo for the invention is a question on which no surmise can be made, till some probable account of the origin of Hindoo literature can be given.

The steps by which the new notation made its way through Europe are not capable of being very clearly traced. Montfaucon (P. 417) found them in an Italian manuscript which was finished in 1317; and many manuscripts of the works of authors a century older contain them, but it is well known that it was usual to substitute the new figures for the old in recopying. In the library of Corpus Christi College, Cambridge, (P. 418,) is a catalogue of eclipses from 1300 to 1348, to which they are subjoined. Graven dates on inscriptions have been given by Wallis and others as old as 1330; but, upon examination, reason has been found to suspect that 5 has been mistaken for 3. There does not seem to be evidence of any general use of the Arabic numerals before the invention of printing; and even the works of Caxton do not contain them, except in a woodcut. Merchants continued their accounts in Roman figures up to the sixteenth century. On the whole, we think that the general use of these numerals in scientific works did not much precede, if at all, the diffusion of algebra.

The only material addition which has been made to this groundwork of arithmetic is the invention of decimal fractions. This is an extension of the principle of local value, of so simple a character, that it is surprising the Hindoos never adopted it. They write fractions as we do, omitting only the line which separates the numerator and denominator, and they make great use of decimal fractions in approximating to the square roots of numbers, but without any peculiarity of notation.

The first fractional notation which we find among the Greeks consisted in writing the denominator where we now

write the *exponent*. Thus retaining our imitation, $\frac{207}{365}$ would be written $2''7 \frac{3}{65}$.

This system is principally used by Diophantus; and in Eutocius we also find a peculiar symbol, something like π , for *one half*. Ptolemy made a further step, in the application of the method of dividing the circle to all units whatsoever, known by the name of the *sexagesimal* notation. The degree of the circle is divided into sixty minutes, the minute into sixty seconds, that again into sixty thirds, and so on: Ptolemy divides every unit in the same manner. We have still retained in our division of the circle the $'$, $''$, $'''$, &c., used by him. In the notation alluded to (which is that of Ptolemy in the particular point referred to)

$27 \ 33' \ 21'' \ 63''$

would denote

27 units, $\frac{33}{60}$, $\frac{21}{3600}$, and $\frac{63}{216,000}$.

This sexagesimal notation retained its ground until the introduction of the Arabic numerals, and, with the aid of tables of reduction, was of material use.

Stifelius and Stevinus (P. 440) used circumflexed digits instead of $'$, $''$, &c., in the *sexagesimal* system, and an application of the same principle to the *decimal* system was first made by Albert Girard in or about 1590. This consisted in expressing fractions by tenths, hundredths, &c., in the following way—

$\frac{3}{10} \frac{4}{100}$ would be written (0) (1) (2)
16 10 100 would be written 1 6 3 4,

the number in brackets over a digit being the exponent of the power of ten, which must be used with that digit as a denominator. Here the application of the principle of local value practically begins; and it is clear, from the examples cited by Mr. Peacock, that the *cipher* was made use of to denote a vacant column. One of those examples is

(0) (1) (2) (3)
941 3 0 4

The rejection of the cumbersome and unnecessary exponents was made in some instances by Wright in 1616, and the system was formally introduced by Napier in 1617: the use of it was much extended by Oughtred in 1631. (See DECIMAL FRACTIONS.) From that time the modern form of the Indian arithmetic must be considered as established. The invention of LOGARITHMS (which see) is the principal aid to calculation which has been engrafted upon the system.

We subjoin a list of names, which the reader may consult on various points connected with the history of arithmetic, either in this work or elsewhere. The figures refer to the century before or after Christ in which the individual is supposed or known to have lived; and the Italics are works which are cited.

B.C. 6—Pythagoras. 4—Euclid, Aristotle, Plato. 3—Archimedes, Apollonius. 1—Vitruvius.

A.C. 2—Ptolemy, Diophantus. 3—Nicomachus. 4—Pappus, Theon. 5—Proclus, Eutocius. 6—Boethius. 9—Mahommed Ben Musa. 11—Gerbert. 12—Jordanus, Leonardo Bonacci. 13—Sacrobosco, Planudes. 15—Lucas de Borgo. 16—Scheubelius, Stifelius, Recorde, Albert Girard. 17—Briggs, Napier, Oughtred, Stevinus, Wright, Bouillaud, Mersenne, Wallis, *Algebra*, Bachet de Meziriac. 18—Weidler, *Historia Astronomiae*, Kästner, *Geschichte der Mathematik*, Montucla, *Hist. des Mathématiques*, Delambre, *Hist. de l'Astronomie Ancienne*, Hutton, *Tracts, History of Algebra*, Colebrooke, *Preface to Bija Ganita*.

We need not of course refer to the work of Mr. Peacock, which we have so often cited.

ARITHMETIC, POLITICAL. [See STATISTICS, INTEREST, ANNUITIES, POPULATION, MORTALITY, &c.]

ARITHMETIC OF SINES. [See TRIGONOMETRY.]

ARITHMETIC, SPECIOUS. [See VIETA.]

ARITHMETICAL COMPLEMENT is that which a number wants of the next highest decimal denomination. Thus, what 7 wants of 10, or 3; 32 of 100, or 68; 159 of 1000, or 841; .017 of 1 or .983. are the arithmetical complements of these numbers. The best way to find them is to begin from the left, subtract every figure from 9, and the last significant figure from 10, as in the following examples, which include all the cases —

No	17634	19.0018	1734000
Ar. Co	82366	80.9982	8266000

ARITHMETICAL MEAN. By the arithmetical mean is meant, that number or fraction which lies between two others, and is equally distant from both. Thus the arithmetical mean between 6 and 14 is 10. To find this arithmetical mean, take the *half sum* of the two numbers. Thus, that of 4 and 17 is $10\frac{1}{2}$. But any numbers are also said to be arithmetical means between two others, when all together form a series of equally increasing or decreasing numbers. Thus, 8, 10, 12, are three arithmetical means between 6 and 14. To interpose any number of arithmetical means between two numbers, divide the difference of those two numbers by one more than the number of means required, which gives the difference between the means. Thus, to interpose four arithmetical means between 27 and 102, divide $75 (102-27)$ by $5 (4+1)$ which gives 15. The means are, therefore, $27+15$ or 42, $42+15$ or 57, $57+15$ or 72, and $72+15$ or 87. If the means are fractional, the same process is employed. [See AVERAGE.]

ARITHMETICAL PROGRESSION is a name given somewhat improperly to a series of numbers which increase or decrease by equal steps, such as 1, 2, 3, &c.; 2, 4, 6, &c. $1\frac{1}{2}$, 2, $2\frac{1}{2}$, &c. The difference between any two successive terms, being *common* to all, is called the common difference. The *data* which distinguish one arithmetical progression from another, are the *first term*, the *common difference*, and the *number of terms*: from these it is easy to find the last term and the sum of all the terms. To find the last term, multiply the common difference by one less than the number of terms, and add the first term to the product. To find the sum of all the terms; take

the number of terms,

the sum of the first and last,

and multiply the half of either (whichever is most convenient) by the other. Thus, for 100 terms of either of the series

3	6	9	12...&c.	(A)
1	$1\frac{1}{2}$	2	$2\frac{1}{2}$...&c.	(B)

To find the last, or 100th, term of (A), multiply 3, the common difference by 99 ($100-1$) and add 3, the first term: which gives 300. Similarly to find the last, or 100th, term of (B), multiply $\frac{1}{2}$ by 99 and add 1, which gives $50\frac{1}{2}$. For the sums we have

	(A)	(B)
No. of terms	100	100
Sum of first and last	303	$50\frac{1}{2}$

Multiply half of 100 by 303, and by $50\frac{1}{2}$, which gives 15150 for the sum of (A), and 2525 for that of (B).

Algebraically, let a be the first term, x the common difference, and n the number of terms. Let z be the last term and S the sum. Then

$$z = a + (n-1)x$$

$$S = \frac{1}{2}n(a+z) = na + \frac{n-1}{2}x$$

from which any three of the letters being given, the other two can be found.

For the theory of which this article is a part, see SERIES, DIFFERENCES, INTEGRATION.

ARITHMETICAL PROPORTION, the relation which exists between four numbers, of which the first and second have the same difference as the third and fourth. Thus:—

$$\begin{array}{cccc} 1 & 2 & 81 & 82 \\ 7 & 3 & 16 & 12 \\ 2\frac{1}{2} & 3\frac{1}{2} & 1\frac{1}{2} & 2\frac{1}{2} \end{array}$$

are severally in arithmetical proportion, and in every such proportion the sum of the extremes is equal to that of the means. Thus:—

$$12 + 7 = 3 + 16$$

ARIUS (*Ἀρίος, martial*) was a native of Cyrenaica, in Africa: the date of his birth seems to be unknown. He was distinguished for personal beauty, graceful manners, extensive learning, logical eloquence, and ascetic abstinence. He has been accused, but without sufficient ground, of restless ambition, and a predilection for innovations. The doctrine which he taught was not at that time a novelty, but had been propagated in the Alexandrine school of divinity, especially by those men, who, having an acute understanding, were nevertheless deficient in the contemplative faculties of the mind. Arius, the two Eusebii, and others, seem to have been rather anxious to defend the church against the introduction of creeds which appeared novel to all who had been brought up in the Alexandrine method of philological divinity. Arius obtained the favour of three successive patriarchs of Alexandria. The patriarch Peter of Alexandria ordained him deacon, but prohibited him from the exercise of ecclesiastical functions, upon Arius, A.D. 306, joining the party of Meletius. The patriarch Achilles of Alexandria, moved by the repentance of Arius, made him, A.D. 313, presbyter and pastor of the church Baucalis, at Alexandria; and the patriarch Alexander gave him the first rank among his clergy, although he is said by Theodoretus (*Hist. Eccles.* i. 2) to have been one of his competitors for the patriarchate. But Philostorgius (i. 3) says, on the contrary, that Arius, observing the choice likely to fall on himself, turned it to Alexander.

The patriarch Alexander, A.D. 318, having asserted, in a conference with his clergy, the unity of substance in the three persons in the Deity, Arius, in reply, accused the patriarch of having fallen into the error of Sabellius, who had confounded the three divine persons. Arius maintained that the Son was created out of nothing before the creation of the universe, and that he could be called God only on account of his participation in extraordinary powers. This doctrine Arius propagated in private; and after he had obtained many followers, he preached it publicly in the church. In order to introduce his opinions among the lower classes, he composed songs for sailors, millers, and travellers, in the measure of popular melodies. The work of Arius called *Thaleia* contained his doctrine in prose and verse. Alexander endeavoured to reclaim Arius by private admonitions in letters and by conferences, but failing in his attempts, he cited him, A.D. 321, before a synod of nearly one hundred Egyptian and Libyan bishops, convened at Alexandria, where his doctrine, his person, and his followers, were anathematized. Two letters of Alexander on this occasion are still extant: one is a circular report to the orthodox bishops (*Socrat. Hist. Eccles.* i. 6; *Mansi, Collect. Conc.* t. ii. p. 793; *Opera Athanasii*, ed. Montfaucon, t. i. pt. i. p. 397); the other is a letter, full of bitterness, to Bishop Alexander, at Constantinople. This letter calls the Arians *Exoukontians*, in allusion to the phrase *ἐξ οὐκ ὄντων*, out of nothing. Among the followers of Arius were two bishops, and several priests, deacons, and virgins.

Arius now began to travel through the neighbouring countries, where he excited sympathy for his misfortunes, and propagated his doctrine. Eusebius, bishop of Nicomedia, to whom Arius wrote a letter, still extant (*Epiph. Hæres.* 69. 6; Theodoret, *Hist. Eccles.* i. 4), absolved him from the Alexandrine excommunication; he also con-

vened, A.D. 323, a synod in Bithynia, probably at Nicomedia, in his behalf; wrote in his favour to all the oriental bishops, and to the Emperor Constantine the Great, who, being at that time yet unbaptized, considered the dispute as trifling in itself, and recommended peace, A.D. 324, in a letter addressed to Alexander and Arius jointly.

Constantine commissioned Hosius, bishop of Corduba, to examine this dispute at Alexandria. Hosius having made a report unfavourable to Arius, Constantine convened the bishops of his empire, A.D. 325, in order to settle the points in dispute between Arius and Alexander. In this council at Nicæa 318 bishops were assembled. Before this body Arius still persisted in rejecting all confessions of faith which maintained the divinity of Christ and the consubstantiality of the divine word, and he opposed the expression *ὁμοούσιος*, applied to the Son as being of the same essence with the Father. Consequently he was again anathematized by the synod, and exiled by the emperor to Illyricum, together with two bishops, Theonas of Marmarica in Libya, and Secundus of Ptolemais, who continued to adhere to him, after Eusebius of Nicomedia, Theognis of Nicæa, and Maris of Chalcedon, alarmed by the emperor's threats, had forsaken his party. Capital punishment was denounced against all who would not deliver up the writings of Arius. After three years, Constantine became reconciled to Arius, through the instrumentality of an Arian priest, who was secretly sent to the emperor by Eusebius, bishop of Nicomedia, and by his sister Constantia. A confession of faith, which seemed to be in unison with the Nicene Creed, was drawn up, and presented by Arius, A.D. 330, to the emperor, by whom he was reinstated in his church at Alexandria; but Athanasius, then bishop of Alexandria, would not admit him. The synods of Tyre and of Jerusalem, A.D. 335, through the influence of Eusebius, re-admitted Arius into church communion, and recommended him to Athanasius; but Arius was sent by his opposers from Alexandria to Constantinople, in order to exculpate himself on account of the troubles excited by his presence at Alexandria. Arius presented to the emperor, A.D. 336, a third confession of his faith, and professed by oath to submit to the synod of Nice. It was accordingly resolved that Arius should be received into church communion in a solemn manner; but according to Socrates he was taken ill of a bowel complaint, during the procession, near the church which was appointed to be the scene of his triumph, and died on the same day, A.D. 336. Some writers ascribed his death to poison. But Athanasius, who probably had more accurate information, states, that Arius died on the evening preceding the Sunday on which he was to be received into church communion. Some Arians asserted that Arius had been killed by the magical practices of his enemies. This accusation contains, at least, a defence against the suspicion of poison.

Eusebius, who became bishop of Constantinople A.D. 339, obtained permission for the Arians to celebrate public worship at Alexandria and other places of the eastern empire. After the death of Constantine, A.D. 350, and the fall of the pretender Magnentius, A.D. 353, Constantius became ruler of the whole empire, and used his power to support the Arians in the councils of Arles, 354, and Milan, 355, the decrees of which he maintained by arms against the Athanasians. Many persons, unable to understand the distinction between the doctrines of Athanasius and Arius, were influenced in the choice of their party by unworthy motives. Most bishops, moved by the court, signed Arian creeds, although some continued to teach Athanasian doctrine. The people, except in occasional tumults, gave themselves little trouble about debates which they did not comprehend. The strict Arians rejected the doctrine of Christ being *ὁμοούσιος*, of similar essence, as well as that doctrine which made him *ὁμογενής*, consubstantiate, or of equal essence, but the Semi-Arians maintained the opinion of his being *ὁμοιούσιος*. The strict Arians, called also Ariomanites, insisted upon the Son being *ἑτεροούσιος*, of another substance. The Goths, Vandals, Suevi, Burgundians, and Lombards embraced Arianism, but exchanged it afterwards for orthodoxy.

The history of Arianism may be divided into three periods: the first commenced a considerable time before the life of Arius, having originated in the Alexandrine schools of divinity of which Origen was the most splendid luminary. It terminated in the synod of Nicæa, A.D. 325. The second period began with the opposition of the Eusebians to the council of Nicæa, and terminated in the second synod of

Sirmium, A.D. 357. During this period the following synods were held: one at Tyre, A.D. 335, in which Athanasius was deposed and exiled to Gaul by Constantine; and immediately afterwards one at Jerusalem, in which Arius was received into church communion.

Another synod was held at Antioch, A.D. 341, in which the bishops declared that they could not be followers of Arius, because, 'how could we, being bishops, be followers of a presbyter?' In this synod, four creeds were approved, in which an endeavour was made to steer a middle course between the Nicæan *Homousios* and the definitions of Arius; which two points were considered to be the two extremes of divergence from the then standard of ecclesiastical orthodoxy in the East. These four Antiochene creeds are extant in Athanasius *de Synodis*, § 22-25. A general council was again assembled at Sardica in Thrace, in which the emperors Constantius and Constans endeavoured to reconcile the combatants for oriental and occidental orthodoxy. Their endeavour proved fruitless. The orientals retired to the neighbouring city of Philippopolis, leaving their occidental opponents alone at Sardica.

Eusebianism was, under Constantius, as victorious in the east as the Nicæan creed was under Constans in the west. The Eusebians thought that the *Homousian* orthodoxy might lead to Sabellianism, and therefore procured the deposition of Marcellus, bishop of Ancyra. The Sabellianism of his disciple Photinus was condemned in the second council of Antioch, A.D. 343, and by another council at Milan, A.D. 346. After the death of Constans, A.D. 350, and the victory over Magnentius, A.D. 353, Constantius endeavoured to establish Eusebianism by violent means in the west. In the synods of Arles, A.D. 354, and of Milan, A.D. 355, he compelled the assembled bishops to sign the condemnation of Athanasius.

The third period terminated with the suppression of Arianism by Theodosius I. The last vestiges of Arianism in the Roman empire are found in a law of Theodosius II. A.D. 428.

[For the sources of information on the Arian controversy, see the following articles:—EUSEBIUS Pamphili, bishop of Cæsarea; EUSEBIUS, bishop of Emesa; CYRILLUS, bishop of Jerusalem. These were the most distinguished writers in behalf of the Antitrinitarian party. The best writers among the Homousiasts were ATHANASIUS, bishop of Alexandria; HILARIUS, bishop of Pictavia; EPIPHANIUS, bishop of Constantia; BASILIUS, bishop of Cæsarea; GREGORIUS, bishop of Nyssa; GREGORIUS of Nazianzus ὁ Θεολόγος; AMBROSIIUS, bishop of Milan; EPHRAEM, diaconus of Edessa, *propheta Syrorum*. Modern works on the history of Arianism are:—*Storia critica della Vita di Arrio*, scritta da Gaetano Maria Travasa, Clerico regolare Teatino, Venezia, 1746—8; Walch's *Historie der Ketzerien*, Th. 2. p. 385, &c.; J. A. Stark's *Versuch einer Geschichte des Arianismus*, Berlin, 1783—85, 2 tom. 8; J. Chr. F. Wundemann's *Geschichte der christlichen Glaubenslehren*, tom. i. p. 264, &c.; Münscher's *Dogmengeschichte*, Bd. 3. p. 351, &c.; Gieseler's *Kirchengeschichte*, book i.; Neander's *Kirchengeschichte*, Band. II. 767, &c.]

ARK, a chest or coffer. This term is frequently used by our earliest English and Scottish poets.

In 1347, in the brewhouse of the priory of Lindisfarne, was an *ark* for meal (see Raine's *North Durham*, p. 92); and among other articles of furniture occurring in an inventory of the household goods belonging to Sherborn hospital, taken in 1636, in the boulting-house, is '1 boulting ark.' (Hutch. *Hist. Durh.* ii. p. 599.) The same word is still in use, in the north of England, for the chest which is employed in containing meal.

Noah's ark was so named from its supposed resemblance to an ark or chest; by which name it occurs both in the Gothic and Anglo-Saxon versions of the passage in Luke, xvii. 27. Wiclif, in this passage, instead of ark, reads ship. The same term *ark* is used in our translation of the Old Testament, for the basket or cradle in which the infant Moses was laid when he was put into the Nile. (See Boucher's *Glossary*, by Stevenson.)

ARKANSAS RIVER, the largest affluent of the Mississippi next to the Missouri, rises in the Rocky Mountains, but its source is not known. Darby, in his *Geographical View of the United States*, conjectures that its source is nearly as far N. as 42°, and 111° W. of Greenwich; but this must only be taken as a guess; the lat. is certainly in excess, and the long. thus assigned is probably too much.

James Peak, one of the highest summits of the Rocky Mountains, which lies between the Arkansas and Boiling Spring Creek, is about twenty-five miles N., 67° W. from a point near this Creek, which is placed in 38° 18' 19" N. lat., 105° 39' 44" W. long., by Major Long's party. The Arkansas joins the Mississippi in 33° 56' N. lat., 91° 10' W. long., with a course, following its bends, estimated at 2000 miles.

The sources of the Arkansas and of the great Rio del Norte are probably near one another. Captain Bell, who was with Major Long's party, traced the Arkansas into the mountains till his progress was stopped by the almost perpendicular gneiss rock, through a deep and narrow fissure in which the river pours with great violence. The Arkansas valley, near the mountains, is bounded by high cliffs of inclined sandstone; lower down these disappear, and there is a slope of alluvial earth extending on each side for several miles; and further down still, horizontal sandstone appears forming high bluffs, or precipices, on each side of the valley. Trees of considerable size here grow along the margin of the river, but their tops are not so high as the level plain on each side, and the descent into this deep-sunk channel is in many places quite impracticable; at a short distance, this narrow valley is not seen at all.

The Arkansas has a general eastern course as far as the meridian of 99°; it has then a winding S.E. course to about 35° N. lat., 95° E. long., from which point it resumes an eastern winding course to about the meridian of 92° 30', from which its course is about S.E. to its junction with the Mississippi. From its sources to about the meridian of 96°, the Arkansas flows through the great plains which stretch eastward from the base of the Rocky Mountains. Though the term plain is more applicable to this region than any other name, it is not strictly a plain; it is an undulating surface, presenting here and there detached table-lands at a small elevation above it, with some knobs and small ridges, the whole cut up into numerous extensive parterres by the beds of streams, to the action of which a great part of the present irregular form of the country is considered to be due, by those who have explored it. The Arkansas valley, for more than 100 miles from the place where it leaves the mountains, contains a considerable quantity of timber, chiefly cotton wood; but further E. the timber almost disappears, and the wide spreading prospect is nothing but a prairie. The river-valley widens in its eastern course, and the bluffs become less elevated; the bottoms are not more than a few feet above the level of the river, which in some parts is spread out a mile in breadth, and contains numerous islands. At some seasons the river is said almost to disappear. About the meridian of 97°, the Arkansas crosses the line marked in Major Long's map as the western boundary of the limestone and coal strata connected with the Ozark mountains; and about a degree, or a degree and a half, E. of this, it enters and traverses the hilly region of the Ozarks, in which it continues to the neighbourhood of Little Rock, when it enters the low alluvial country. Little Rock is about 120 miles from the Mississippi, not including all the small bends of the river.

This river is joined by numerous large tributaries. Running into it on the right bank are the Negracka or Red Fork, and the Nesuketonga or Grand Saline, which join the Arkansas W. of the meridian of 97°; both of them probably come from the Rocky Mountains.

Near the meridian of 95° the Arkansas is joined on the right bank by the Great Canadian, which rises in the Rocky Mountains, probably three degrees at least S. of the sources of the Arkansas, and is computed to run 1000 miles before it joins the main stream. Its general course is E., with a considerable bend to the S.; a space of great extent is thus included between the Arkansas and the Canadian, in which numerous streams, several hundred miles in length, have their origin and course. The great affluent of the Canadian, the North Fork, lies in this intermediate space; it joins the Canadian on the left bank six or eight miles lower down than the South Fork, which enters the Canadian on the right bank. Near its source the valley of the Canadian is narrow, and faced by bluffs from 200 to 500 feet high. Lower down its bed is wide, and only a few feet below the bottom land which lines it on each side. Though it drains an immense extent of country, it is quite stagnant for a large part of its course in summer, and its wide bed is in many places entirely dry; in one instance observed by Major Long, the Canadian was buried in its sands for more than 100

miles. The waters of the Canadian contain various proportions of common salt and sulphate of magnesia in solution, which often render them unfit for use; saline and nitrous efflorescences, and considerable incrustations of salt, characterize some portions of the country drained by the Arkansas and the Upper Canadian. Major Long's party, in their exploring expedition of 1819, 1820, mistook the Canadian for the Red River, and were not undeceived till they had traced this stream to its confluence with the Arkansas.

The character of this extensive region, W. of the Ozark mountains, and included between the Arkansas and the Rocky Mountains, will be best understood from reading the interesting narrative of Major Long's expedition. The trees are found almost exclusively on the banks of the streams; the high flats above the bottoms present in general nothing but a covering of grass or stunted shrubs. Sandy plains covered with wormwood and other plants; a burning sun which, even in September, raises the thermometer above 90° in the shade; and a general want of timber, water, and navigable streams, render these regions difficult and even dangerous to cross, and only fit for the residence of a nomadic people. Wild animals are sometimes found in abundance, and sometimes it is difficult to meet with them; the black bear, deer, antelope, white wolf, jackal, bison sometimes seen in countless herds, wild turkey, Virginian partridge, and marmot, commonly called the prairie dog, form part of the inhabitants of this wilderness. The wandering tribes of Indians are inconsiderable in numbers.

The annual flooding of the Arkansas commences early in March, and it attains its greatest height in the delta of Louisiana in the month of June; the flooding of the Arkansas is after that of the Red River, which lies further S., and contemporaneous with that of the Ohio. The flooding from the Missouri is the latest. In the bluffs of the Canadian, as well as on the upper part of the Arkansas, extensive beds of gypsum appear embedded in a ferruginous clay and a fine sand of a deep red colour; owing to this, the Arkansas, and the Canadian also, are generally of a deep red colour, especially during the floods. The waters of the North Fork of the Canadian and of the Upper Arkansas are of a greenish colour when not swelled by the rain.

(Darby's *View of the United States; Long's Expedition to the Rocky Mountains.*)

ARKANSAS TERRITORY, one of the territories of the United States not yet raised to the rank of a sovereign state. It is bounded by the state of Missouri on the north, the Mississippi on the east, Louisiana on the south, Texas on the south-west, and on the north-west by the western territory of the United States. It lies between 33° and $36^{\circ} 30'$ N. lat., and $89^{\circ} 44'$ to $100^{\circ} 5'$ W. long. from Greenwich. The river boundary on the east is about 360 miles, not reckoning all the small curvatures. A line of 170 miles drawn west along a parallel of latitude separates it from Louisiana. The Rio Roxo or Red River, one of the large affluents of the Mississippi, forms the remainder of the southern boundary separating Arkansas from the Mexican territories. The 100th western meridian from Greenwich forms the western limit of Arkansas; and the parallel of $36^{\circ} 30'$ separates Arkansas on the north from the north-west territory and from the state of Missouri, all but a small portion where the line follows the St. Francis river for $30'$ south, and then runs for 34 miles eastward to the river Mississippi. The circuit of Arkansas is about 1320 miles, and the area is computed at 121,340 square miles, between one-fifth and one-sixth more than the reputed area of Great Britain and Ireland.

Arkansas may be divided into three physical regions, an eastern, a central, and a western region. The eastern, bordering on the Mississippi, is low and flat, generally covered with dense forest, without good water, and almost without stones. In the central section the ground begins to ascend gradually, and the forests are interspersed with prairies; hills also begin to appear increasing in elevation as we advance westward. These hills, known most commonly under the name of the Ozark mountains, form a continuous chain which probably is an offset from the Mexican system; but about this there is still some doubt. The Ozarks enter Arkansas from the province of Texas, and crossing the territory in a general north-east direction, but nearer to the eastern than the western limit, enter the state of Missouri. The Ozarks are not a ridge of hills, but, like the Appalachians, a mountain-system, probably occupying two degrees

or more in breadth; the general direction of the mountain mass is from south-west to north-east. The falls on the upper Washita ($34^{\circ} 25'$ N. lat.) are formed by a kind of hard freestone, extending across the bed of the river in the direction just mentioned.

The western portion of Arkansas is an extensive elevated level, continually increasing in height as it runs westward towards the Rocky Mountains: it is a country of grass almost without trees, traversed by the long streams which join the Rio Roxo and the Arkansas river. Besides the Rio Roxo which forms, for above 400 miles, the south-western boundary of Arkansas, the territory is watered by other affluents of the Mississippi. White River and St. Francis both rise in the Ozarks of Missouri, north of the Arkansas River. White River is formed by the union of numberless streams which rise in the Ozarks, and are united in two main streams, the western called the White River, and the eastern the Big Black River. The Big Black River is formed by numerous streams which rise further N. in the Ozarks; one of these, called Spring River, which is not 200 miles long, discharges more water into the Big Black River than the Canadian, 1000 miles long, into the Arkansas. The united stream under the name of White River, has a general southern course, and joins the Mississippi fifteen miles above the outlet of the Arkansas, after a course of above 400 miles. A channel forks off three miles above the junction of the main stream with the Mississippi, and runs into the Arkansas. The St. Francis flows between the White River and the Mississippi in a general southern direction, and joins the Mississippi about sixty-five miles direct distance N.E. of the junction of the Arkansas with the Mississippi.

The Ozarks, between the Arkansas and Red River, rising above the low lands and spreading out into a hilly region of great extent, become the sources of numerous streams. Of these, one of the principal is the Washita. We are not aware that the remotest source of this stream is yet laid down with any accuracy, but the position of the hot springs near one of its sources has been ascertained to be in $34^{\circ} 31'$ N. lat., and $92^{\circ} 50'$ W. long. There are four principal springs; the highest temperature observed was 154° of Fahrenheit; the lowest temperature was 135° . It was computed by Mr. Dunbar's party that the quantity of hot water discharged by all the four springs and some minor sources is about 3771½ hogheads in twenty-four hours. Later visitors make the hot springs seventy in number. Major Long, who visited them in 1818, states the highest temperature to have been 151° . Several springs discharged respectively ten, twelve, and twenty gallons of hot water per minute: some of them were at least 100 feet above the bed of the river. Cold springs also exist on the same area as the hot springs. The hot water is colourless and tasteless, but makes a deposit of lime, siliceous matter, and oxide of iron. The Washita, increased by the Saline and several other tributaries, takes a southern course turning a little to the east. The junction of the Washita, Catahoola, and Tenza (about $31^{\circ} 30'$ N. lat.), forms the Black River, which empties itself into the Red River.

The climate and productions of this extensive territory vary with the elevation of the surface and the distance from the level of the Mississippi. The low region along the Arkansas is covered with a dense forest of trees, and an impenetrable undergrowth of shrubs and cane; its fertile soil produces cotton, Indian corn, melons, sweet potatoes, and some tobacco, but the sugar-cane will not succeed so far north. The peach, the nectarine, the grape, the papaw, and a variety of other fruits, succeed better than the apple, which is small. The papaw is sometimes thirty or forty feet high, and its trunk not less than a foot in diameter. The heat in summer is intense, and the annoyance from mosquitoes sometimes almost insupportable. The only water fit to drink is the rain water, which is preserved in large jars sunk in the ground; the river water when filtered is fit for use, though many of the inhabitants are obliged to dispense with this process. Snakes and other venomous reptiles abound in the thick forests. In the early part of the year, the cold is often severe for a short time, and but snow and ice are occasionally seen at this season. Thunderstorms in summer are often terrific, and the rain descends in torrents. The climate is unhealthy, especially for newcomers; ague and bilious fevers prevail in the summer and autumn, and are often fatal.

The Ozark region, which commences near Little Rock on the Arkansas, and extends nearly as far W. as the junction

of the Canadian and Arkansas, is only partially known. Near the hot springs of the Washita, the soil in the river-valley is of good quality, and the lower hills, which are not above 300 feet high, as well as the base of the higher hills, are covered with a soil of middling quality. The black and red oak, with a variety of other woods, and a considerable undergrowth, are found in the valleys of this region. On the rocky parts of the hills there are three or four species of vines, said to produce an abundance of excellent grapes. An immense bed of dark blue schistose rock (clay slate) appears to form the base of the hot spring hill, and those near it; and pieces of this rock in a state of decomposition, possessing a strong aluminous taste, are frequently met with. The temperature of the atmosphere at the springs on the 31st of December, 1804, was 29° at sunrise, 32° at 3 p.m. with a wind S.E. and snow. On the morning of the 30th of December it was 9° at sunrise, 38° at 3 p.m. with a high N.W. wind. On January 2, 1805, the thermometer was 6° at sunrise. The Ozarks between the Arkansas and the Red River, though resembling the Appalachians as to general direction, are said not to show, like the mountains east of the Mississippi, a set of parallel ranges.

The real sources of the Washita are about 100 miles N.W. of the hot springs in an elevated region, from which some small tributaries flow into the Arkansas, and others into the Red River. The hills in this part are so thinly covered with pine and post oak, that the grey sandstone is the prevailing colour in the landscape. In the river-valleys of these mountains, as, for instance, on the Saline branch of the Washita, there are lands not inferior to any in the Mississippi valley; the timber is pine, oak, ash, hickory, and sugar-maple. These trees, the undoubted marks of a rich soil, are also found along the base of the mountains, S.E. of the hot springs, and form an exception to the general remark, that the best soils in Arkansas are in the river alluvium. The deer and the wolf abound in these high regions; and the wild turkey is still numerous on the banks of the White River. (For the geological structure and general character of the Ozarks, see that article.)

The region W. of the Ozarks has been already partially described. It commences near the junction of the Canadian and Arkansas; and though timber and thick undergrowth are found in the bottoms of the rivers, we trace from this point, or about a degree westward, the great red sandstone formation with its bare and monotonous surface which extends to the Rocky Mountains. The red colouring matter of the sandstone stains the waters of the Canadian a dark red colour, and the soluble salts associated with this rock give its waters a strong saline taste.

The mineral wealth of the territory is yet hardly known. Iron certainly exists, and probably lead and coal; salt might probably be produced in abundance from the salines near the Washita, and in other places.

The Arkansas derives its name from a tribe of Indians, probably now extinct; they spoke the Osage language. It was first explored and settled by the French in 1685. In 1763, the whole of Louisiana was ceded to Spain, who kept possession of it till 1800, when, by a secret treaty, it was given back to France. In 1803, Louisiana was purchased by the United States from France for 15,000,000 dollars, and it contained, according to the terms of the purchase, not only the state so called, but Arkansas, Missouri, and the N.W. territory. The post of Arkansas, on the left bank of the Arkansas river in the low country, is an old Spanish settlement. Little Rock, the seat of government, is higher up the country, on the right bank of the same stream, 34° 43' N. lat., 92° 15' W. long. The population in 1830 was 30,388, of whom 4576 were slaves.

The governor is appointed by the president, with the consent of the senate; the term of office is three years, and the salary 2000 dollars. There are four judges, with salaries of 1200 dollars each. The militia of the territory was 2028 in 1831. The territory sends one delegate to congress. The most recent division of the state that we have seen makes fifteen counties. According to a statement in the *Encyclopædia Americana*, the limits of what is properly called Arkansas territory have been reduced to 45,000 square miles. The population of Arkansas consists of Indians, some French, a very few Spaniards, Americans, and such adventurers from all countries as are found on the verge of civilization. Education does not exist in the territory, and the power of law is yet too feeble to repress and punish acts of personal violence, which are not uncommon.

Of the Indian tribes as at present existing in Arkansas, we can give no satisfactory account. The Quapaws, Choctaws, some Osages, and other tribes, still inhabit the territory. The Chickasaw Indians are now endeavouring to select a suitable spot in Arkansas for their future home.

(Darby's *View of the United States*; President Jefferson's *Message of February 19, 1804, communicating Dunbar and Hunter's Visit to the Hot Springs of the Washita*; Long's *Expedition to the Rocky Mountains*; Nuttall's *Arkansas*; *American Almanac*, 1834.)

ARKEEKO, a sea-port on the western coast of the Red Sea, in 15° 38' N. lat. and 39° 37' E. long. It lies three miles S. of the small island and town of Massowah, where the vessels from Jidda and other parts cast anchor. The goods that are destined for the Abyssinian market are then carried to Arkeeko, where the kafilas or caravans assemble. From Arkeeko the kafilas journey in a southward direction, passing over the Taranta mountains, and proceed to Dixan, the first Abyssinian town on that side, and thence to Adowa, the chief mart of trade in the kingdom of Tigre. [See ADOWA.] Arkeeko is about forty-miles N. by E. of Dixan, and about 100 N.N.E. of Adowa, but the distance is much greater by the road or track which the kafilas follow. Arkeeko lies in a sandy flat country which stretches between the coast of the Red Sea and the foot of the Taranta and Assauli mountains which divide it from Tigre. This maritime region is not now under the power of the Abyssinians, but is occupied by native independent tribes, nomadic and predatory like those of the Arabs, and often at war with their Abyssinian neighbours. They are nominally Mohammedans, and speak various dialects, of which Mr. Salt gives short vocabularies. The Hazorta tribe occupy the country immediately to the south of Arkeeko, and when at peace they escort the kafilas between Arkeeko and Dixan. The town or village of Arkeeko is under the rule of a nayib, or native chief, who is himself under a sort of dependence on the aga or military governor of Massowa, which latter used to be appointed by the shereef of Mecca. The authority of the pacha of Egypt has now superseded that of the shereef. The aga levies a duty upon all goods which are imported into Abyssinia. Arkeeko is a small and miserable place; its only importance consists in being the point of the coast nearest to the Abyssinian territories, and through which all intercourse by sea to that country is now carried on. The territory of the Baharnegash, a dependency of the kingdom of Tigre, stretches to within twelve or fourteen miles W. of Arkeeko. Mr. Salt gives a very bad account of the people of Arkeeko: 'they are much worse than their neighbours of Massowa, who are themselves not so good as the worst of the Arabs.' The bay of Arkeeko is separated to the eastward by the Giddam mountain and promontory from Annesley's Bay, which stretches southward to Zulla, the antient Adule, which was formerly the maritime emporium of Abyssinia. [See ADULE; Salt's *Abyssinia*; Valentia's *Travels*.]

ARKLOW, a town in Ireland, in the barony of Arklow, county of Wicklow, 46 miles south of Dublin, on the road to Wexford, in 52° 48' N. lat., 6° 10' W. long., from Greenwich. It is on the south bank of the Ovoca, or Avoca, about 500 yards from the sea, and has a main street, running nearly parallel to the stream, with a gentle descent towards the sea: this forms 'the Upper Town.' At the upper end of this is a barrack with a walled yard, connected with an old tower partly destroyed by Oliver Cromwell. Towards the lower end of this street, the road by the coast from Wicklow, which leads by a bridge of many arches over the Ovoca, enters the town; and a little below this is the part denominated the Fishery, consisting of mud cabins, built very irregularly. There is a handsome modern church, on a rising ground about the centre of the town, and a square chapel on an open and convenient spot in the Upper Town. The shore is skirted by a line of sand hills. Some steps have been taken to improve the haven, which is bad and little used, except by the fishermen. The herring fishery employs a number of boats, which have usually six hands in each. In the intervals between the herring seasons, the men dredge for oysters on the beds off the coast; they carry their oysters to Liverpool, and bring back earthenware and coals. Their children in the mean time make nets. This fishery is the chief occupation of the inhabitants of the town, who amounted in 1821 to 3808, and in 1831 to 4383. Arklow has a fever hospital and a dispensary. There are four fairs, at which are sold cloths and woollens of different descriptions, also black cattle, pigs, &c.

The parish of Arklow is a rectory and vicarage in the diocese of Dublin, episcopally united from time immemorial to the vicarage of Enorely, or Ennerily, and the curacies of Kilbride, Killahurter or Kilmain, and Temple Michael, all contiguous. Besides the ruins of the castle above-mentioned, there were the remains of a monastery for Cistercian friars, founded in the thirteenth century by Theobald Fitzwalter, fourth butler of Ireland (a former officer of state); but these are now removed.

In the rebellion of 1798, Arklow was the scene of a very severe contest. On the 9th of June, a body of insurgents (whose numbers are variously given at 'above 20,000, of whom 4000 or 5000 carried guns,' and at 31,000) advanced against the town, which was defended by nearly 1600 men, under the command of Major-General Needham and Colonel Skerrett. The assailants advanced with great impetuosity, and succeeded in entering and burning the part of the town nearest the sea—the 'Fishery,' which consisted then, as now, of thatched cabins, inhabited by fishermen. The contest, however, was severest at the upper end of the town, and was maintained with great courage, the Durham Fencibles especially distinguishing themselves in the defence. Ultimately, about nightfall, the rebels were repulsed, and retired, without being pursued, towards Gorey, after suffering considerable but not well ascertained loss. (*Carlisle's Top. Dict.*; *New Stranger's Guide*; *Musgrave's Memoirs of the Rebellion in Ireland*; *Gordon's Hist. of Ireland*; *Shaw Mason's Stat. Account of Ireland*.)

ARKWRIGHT, SIR RICHARD, one of those extraordinary men whose ingenuity has exerted a most powerful influence upon the condition of civilised society, was born at Preston, in Lancashire, on the 23rd of December, 1732. His parents moved in an humble walk of life; and as he was the youngest of thirteen children, we may suppose that the amount of school learning which he received was exceedingly scanty. He was brought up to be a barber, an occupation which could afford but little promise of distinction, and it is probable that, had he continued to follow that business, the powers of mind which he exhibited, and to which his great success in life must be attributed, would have lain dormant, or might have been stifled by the petty cares attendant upon a low and precarious profession. About the year 1760 he quitted business as a barber, which he had previously carried on in the town of Bolton, and became a dealer in hair. This article he collected by travelling up and down the country, and when he had dressed it, sold it again in a prepared state to wig-makers. The profits of this business were increased, and the circle of his customers was enlarged, by means of a secret process for dyeing hair which he possessed, and which is said to have been a discovery of his own. This last fact is, however, doubtful, as chemistry was not among the subjects which he at any time studied; and it is probable that, had his first successful project been the result of his own investigations in that branch of science, he would have continued to devote his attention to similar objects, and not have been led away to the study of mechanics, of which also his knowledge appears to have been for some time exceedingly limited.

His first effort in mechanics was an attempt to discover the perpetual motion. This direction having been given to his thoughts, it may naturally be supposed, that the circumstance of his living in the midst of a manufacturing population, the growing demand for whose productions placed them in continual difficulty as to procuring the material principally required for their manufacture, would lead him to consider the possibility of contriving some machine by which that difficulty might be lessened or overcome.

Up to the time we have mentioned, the cloths of English manufacture called calicoes, which were made in imitation of Indian goods, and so called from Calicut, the place of their production, were formed by a mixture of linen and cotton: the warp was composed of linen and the weft of cotton, it being found impossible, by any means then known, to spin the fibres of cotton into a thread sufficiently strong to be used as warp. The cotton for the weft was at this time delivered in the raw state by the master manufacturers, together with the linen yarn, to cottagers living in the little villages of the district, who both carded and spun the cotton wool, and wove the cloth. The demand for these cloths soon became so great, that the females in the weaver's family by whom the carding and spinning processes were performed, could not prepare sufficient weft to keep the looms employed, and the weaver was obliged to engage

additional hands for preparing the cotton. The limit to which this species of employment could be carried was soon reached, and if some more productive mode of spinning than that by the one-thread wheel, then the only machine known had not been discovered, the progress of the cotton manufacture must have been stopped, or at best would have been extremely slow. Mr. Guest, in his *History of the Cotton Manufacture*, tells us, that at this time 'it was no uncommon thing for a weaver to walk three or four miles in a morning, and call on five or six spinners, before he could collect weft to serve him for the remainder of the day.'

It has been said that the cotton yarn then produced in England did not exceed in quantity what is turned off by 50,000 spindles at the present day, being about the one hundred and fiftieth part of the number now in constant use. It is not our intention to go into further particulars on this subject, which may be better detailed under the head of COTTON MANUFACTURES, but some slight notice of the state of things preceding the great invention of Arkwright appears necessary, in order to show more clearly the advantage which the country has derived from his inventions.

It has been much the fashion to depreciate Arkwright's talents, and even to deny him altogether the merit of being an original inventor; and he has sometimes been considered as a plagiarist or pirate of other men's ideas. If, however, the evidence is carefully weighed upon which it has been attempted to convict him of this serious charge, we think it will be found to rest upon very slight grounds; while the proofs which he exhibited of possessing talents of the very highest order in the management of the vast concerns in which he was afterwards engaged, are unquestionable. The evidence brought forward upon the trial for repealing his patent in 1785 was that of persons in a low station of life, who spoke of circumstances which had occurred eighteen years before. One of the witnesses—the principal one—had been employed by Arkwright to assist in making the models for his machine, and, in order to invalidate the patent, he accused himself of having betrayed the confidence of the real inventor, for whom he had previously made a similar machine. The combination against Arkwright which produced this trial was of a very powerful description, and without wishing to impute to any persons so serious a crime as subornation of perjury, it is at least probable that all were ready to listen to and to reward witnesses who were willing to aid their cause, without inquiring too nicely into the actual merit of their testimony. Of late, the case of a still earlier invention has been brought forward, to which no allusion was made upon the trial in 1785; a circumstance which makes it probable, that the memory of its true nature was at that time completely lost. It is, therefore, consistent, not only with charity, but also with strict justice, to suppose that Arkwright himself, then a very illiterate and ill-informed man, knew no more of this earlier invention than the rest of the world after attention had been directed to the subject for so many years. We allude to the case of a patent for spinning by means of rollers, which was taken out in the year 1738, by Mr. Charles Wyatt, of Birmingham, in the name of Lewis Paul, a foreigner, with whom Wyatt had formed a partnership. The specification of Wyatt's invention has recently been brought to light and published, and there can be no doubt that it contains the principle of Arkwright's patent to an extent which deprives him of the honour of having been the first inventor of his plan, while it equally deprives of that honour the men upon whose testimony Arkwright lost his cause. It cannot, however, be considered impossible, or even improbable, that two men should actually invent the same machine. Wyatt's contrivance had been tried in Birmingham and at Northampton in 1741, but was so far from being successful, that the machinery was sold in 1743, and it is no known what became of it. That twenty years afterwards Arkwright should have had more than a traditional knowledge of Wyatt's plan is not very likely. In the 'Case' which he drew up to be presented to Parliament in 1782, and which was printed and extensively circulated three years before the trial already alluded to, he makes mention of the fact in these words:—'About forty or fifty years ago, one Paul and others of London invented an engine for spinning of cotton, and obtained a patent for such invention; afterwards they removed to Northampton and other places. They spent many years and much money in the undertaking, but without success; and many families who had engaged with them were reduced to poverty and distress.' This 'Case' was drawn up at a time when his patent-right was

being constantly invaded, and it is incredible, that, if he had possessed a knowledge of the particulars of Wyatt's patent, he should have thus drawn public attention to it, since he must, in that case, have known that the production of the specification would at once have deprived him of every ground upon which he attempted to establish his own rights as an inventor.

It is perhaps unnecessary on this occasion to enter at greater length into this matter, which, however, it was impossible to pass over unnoticed, considering how greatly the question of Arkwright's inventive talent has at various times been controverted. We shall now proceed in our account of this extraordinary man, on the supposition of his having been in reality what he represented himself to be, the inventor of the ingenious machine for which he obtained his patent.

In the course of his inquiries after some person qualified to assist him in making the movements for his first projected machine, which, as we have already said, was one for producing perpetual motion, Arkwright became acquainted with a clockmaker, named Kay, then residing at Warrington, whose services he engaged and retained for four or five years, first at Preston and afterwards at Nottingham. The account which Kay himself gave of this connexion upon the trial in 1785, where he was the principal witness, was, that it broke off in consequence of his having been unjustly accused of felony.

From the year 1767, it appears that Arkwright gave himself up completely to the subject of inventions for spinning cotton. In the following year, he went to Preston, and set about constructing his first machine, which was put up in the dwelling-house attached to the free grammar-school of that town. At this time Arkwright's poverty was such, that, 'being a burgess of Preston,' he could not appear to vote during a contested election, till the party with whom he voted gave him a decent suit of clothes. Shortly after, apprehensive of meeting with the same kind of hostility which had a short time previously been shown to a man named Hargreaves, who also had invented a machine for abridging labour in cotton-spinning, Arkwright left Lancashire and went to Nottingham. Here he made arrangements with Messrs. Wrights, bankers in that town, for obtaining the necessary supply of money; but these gentlemen, after a short time, declined to continue their advances, and introduced him to Mr. Need, a stocking-manufacturer of that place, as a gentleman likely to enter into his plans. Mr. Need was at that time in partnership with Mr. Jedediah Strutt, of Derby, the ingenious improver and patentee of the stocking-frame, whose opinion he naturally asked upon the occasion; and it is a remarkable fact, strongly corroborative of Arkwright's claim to be the original inventor, that, although Mr. Strutt saw and at once acknowledged the great merit of the invention, he pointed out various deficiencies which the inventor, from the want of mechanical skill, had been unable, with all his powers of contrivance, to supply. These defects were easily remedied by Mr. Strutt, and in the year 1769 Arkwright obtained his first patent for spinning with rollers, and Messrs. Need and Strutt became his partners in the manufacturing concerns which it was proposed to carry on under it.

The improvement for which this patent was obtained consisted principally in the use of two pairs of rollers, the first pair slowly revolving in contact with each other; while the second pair, at a little distance, was made to revolve with greater velocity. The lower roller of each pair was fluted longitudinally, and the upper one was covered with leather, by which means the two would have a sufficient hold upon the cotton passed between them. The cotton, when passed through the first pair of rollers, had the form of a thick but very soft cord, and was no further altered in its texture than receiving a slight compression; but it is evident that, as the second pair of rollers moved with twice, thrice, or ten times the velocity of the first, the cotton must be drawn out twice, thrice, or ten times smaller than when delivered from the first rollers. The validity of this patent was contested in 1772, on the ground of Arkwright not having been the original inventor of the process, but a verdict was given in favour of the patent, which no one afterwards attempted to disturb.

The first mill erected for spinning cotton by this method was at Nottingham, and was worked by horse-power; but in 1771 another mill was built at Cromford, in the parish of Wirksworth, in Derbyshire, to which motion was given by

water; from this circumstance the machine was called the water-frame, and the thread received the name of water-twist.

Previous to this time no establishment of a similar nature had existed, none at least to which the same system of management was applicable; and it strongly marks the judgment and mental powers of Arkwright, that although the details of manufacturing or commercial business were altogether new to him, he at once introduced a system of arrangement into his works which has since been universally adopted by others, and which, in all its main features, has remained unaltered to the present time.

The great invention, which has been very slightly described above, was followed up by various improvements and combinations of machinery, for which a second patent was obtained in 1775. His right to this patent was disputed in 1781, on the plea that some of the contrivances which it comprehended were not original; and his monopoly was invaded to such an extent by other cotton-spinners, that to maintain it he was obliged to bring actions against nine different parties. The first of these actions was tried in July, 1781, when he was non-suited, not on the ground originally taken by his opponents, but because it was held that the specification or description of the invention which he had enrolled, did not comply with the terms upon which the patent was granted, viz. that it should contain such a full and particular account of the invention as would enable the public to avail themselves of its advantages after the expiration of the term for which the monopoly was granted.

The result of this trial occasioned Arkwright not only to abandon the other eight actions which remained to be tried, but also, for a time at least, to forego the rights derived from his second patent. It was on this occasion that he drew up and published a pamphlet, to which allusion has already been made, and which he called his 'Case.' The object of this pamphlet was to impress the members of the legislature with the propriety of interfering for his protection.

Having in the beginning of 1785 obtained the testimony of several competent persons in favour of the sufficiency of his specification, Arkwright then commenced a new action, which was tried in February of that year, and decided in his favour thereby reinstating him in the possession of his monopoly. By this time, however, the number of persons interested in destroying that monopoly had greatly increased; on the faith of the former verdict large capitals had been embarked which would have been subjected to heavy depreciation if the patent could have been sustained, and accordingly in a very few months an action was brought for the cancelling the patent by a writ of *scire facias*, nominally at the suit of the crown, but actually prosecuted by the cotton-spinners of Lancashire, who would have been liable to penalties for continuing to use the invention. These parties actually formed an association for the purpose of trying this cause; and engaged scientific gentlemen to discover the technical defects of the patent and to arrange the evidence for its overthrow. It was on this occasion that the testimony of Kay was adduced to show that, previously to his having been employed in 1767 to make a model for Arkwright, he had been similarly engaged by another person who was likewise brought forward to corroborate the fact, and upon this evidence the jury found a verdict for the crown, and thereby annulled the patent. A new trial was applied for in the following term, on the ground that Arkwright had procured evidence to rebut that upon which the verdict was grounded, but the motion was refused by the court.

The opposition here described was not the only difficulty which Arkwright had to encounter from rival manufacturers. Although the yarn which he made was so far superior to that produced by the old method of spinning that it could be used for warp, they combined to discountenance its use. A very considerable stock lay upon his hands in consequence, and he and his partners were driven to undertake the conversion of this yarn into manufactured goods. They first used it with perfect success in making stockings, and soon after established the manufacture of calicoes, such as they are made at the present day. But here another difficulty assailed them. Their orders for this description of manufacture, then new to England, were exceedingly great, but could not be complied with, on account of the demand on the part of the officers of excise of a duty of sixpence per yard, as being calicoes similar to those imported, and upon which a like duty was levied, while other English-made cloths were subject to only half that rate. It was not until application for relief had been made to parliament that this

obstacle was removed, and a large accumulated stock of cloths was disposed of. On this occasion an act of parliament was passed, in spite of the strenuous opposition of the Lancashire manufacturers, declaring that 'Whereas a new manufacture of stuffs made entirely of cotton spun in this kingdom has lately been introduced, and some doubts are entertained whether it is lawful to use it, it is declared to be not only a lawful but a laudable manufacture, and is therefore permitted to be used on paying threepence per square yard when printed, painted, or stained with colours.'

Five years expired from the first establishment of the works at Cromford before any profit was realized, but after that time wealth continued to flow in abundantly to the proprietors. The establishments were greatly extended, several new ones were formed, and, in many cases, Arkwright took a share with other persons in the erection and working of cotton-mills. This tide of prosperity continued to set in notwithstanding the adverse decision of the courts in regard to his patent. For several years, the market prices of cotton twist were fixed by Arkwright, all other spinners conforming to his scale. The same quality of this article which now sells for about 3s. per pound, sold, in 1790, for ten times that price, and was as high as 1*l.* 18s. per pound in 1786; and although a great part of this difference is no doubt owing to a progressive economy attained in the processes of manufacture, it is not difficult to imagine that the larger price must have been exceedingly profitable to the spinner.

Mr. Arkwright was appointed high-sheriff of the county of Derby in 1786, and on the occasion of presenting an address of congratulation to the king on his escaping the attempt at assassination by Margaret Nicholson, received the honour of knighthood. Notwithstanding the increasing inconvenience which he experienced from a severe asthma, with which he had been occasionally afflicted from early life, Sir Richard continued to give the most unremitting attention to business, and superintended the daily operations of his large establishments, adding from time to time such improvements to the machinery as were suggested by experience and observation. He sunk at length under a complication of disorders, accelerated if not produced by his sedentary habits, and died in his house at Cromford, on the 3d of August, 1792, in the sixtieth year of his age, leaving behind him a fortune estimated at little short of half a million sterling.

Considering the difficulties in which he was placed by the deficiency of his early education and the unfavourable tendency of his early employment, Arkwright must be acknowledged to have been a very extraordinary man. Even without claiming for him the honour of having been an original inventor,—an honour which, upon the best consideration we can give to the conflicting evidence brought forward, we are still inclined to award him,—we may certainly ascribe to him the possession of a clear and comprehensive mind, as well as the most unerring judgment. His plans were all laid with skill, and pursued with energy; he displayed the most unwearied perseverance in pursuit of his object under difficulties which would have borne down most men; and he forms one among the bright instances afforded by the annals of this country, that talent, when thus allied with patient energy and persevering industry, will not fail to ensure ultimate success to its possessor. (*Library of Entertaining Knowledge*; Baines's *History of the County of Lancaster*; Godson's *Treatise on the Law of Patents*.)

ARLES (Arelate, *Cæsar*; *Ἀρελάται*, *Strabo*), a town in France, in the department of Bouches du Rhône, 453 miles S. by E. from Paris, through Lyon, Avignon, and Tarascon; or, about 440 by Mende, Nîmes, Beaucaire, and Tarascon, crossing the Rhône between the two last-mentioned towns. It is 75 miles by a circuitous route through Aix and Tarascon, from Marseille, the capital of the department, but considerably nearer by the road through Jonquieres and the marshes near the coast. 43° 40' N. lat., 4° 35' E. long. from Greenwich.*

The city is on the left bank of the Rhône, just at the point where the river, dividing into two channels, encloses the marshy island of La Camargue, or Carmague. It is in a district abounding in marshes and pools, which surround it on almost every side, and produce vapours which are carried to the city by the winds. But for this circumstance, it would be one of the most delightful situations in France; the country around, with its verdant meadows, presents some

* So in the Map of France published by the Society for the Diffusion of Useful Knowledge. By Brue's Map (Paris, 1818), it is 2° 18' E. of Paris, equivalent to 4° 38' E. of Greenwich.

agreeable scenes; and the alleys of mulberry-trees make pleasant promenades.

The town itself is but ill built, with narrow, crooked streets, and old houses. A bridge of boats unites it with the suburb of Trinquetaille, on the opposite bank of the Rhône, and serves also as a place of resort when the inhabitants wish to enjoy a cooling breeze. There is a Gothic cathedral, built, it is said, partly by St. Virgilius, archbishop of Arles, A.D. 626, and partly by Cardinal Alleman, one of his successors, in the 15th century. The portal is distinguished by sculpture of a grotesque and somewhat indelicate character. The most striking modern edifice is the town-hall, which was built in 1673, after the design of the architect Mansard. It is of white stone; and its two façades (for it stands between two *places*, or squares) display three orders of architecture intermingled. There are several antiquities in it.

The situation of Arles on the banks of the Rhône gives it considerable advantages for trade. There is also a navigable canal, which runs through the marshy district on the left bank of the eastern or main channel of the Rhône, from Arles to the Port de Bouc, on the Mediterranean, at the entrance of the Etang de Berre, or, according to the Society's map, to Foz, which is between Arles and the Port de Bouc. This canal, for the greater part of its course, runs nearly parallel to the above-mentioned branch of the Rhône, and not far from it. The corn, wine, fruits, manna, and oil, of the surrounding country, find sale at Arles; and several manufactures are carried on, as of glass bottles, soap, silk, tobacco, and brandy. The sausages of this place are in high repute. The population is about 20,000. There are a school of navigation, a high school, a museum of antiquities, and a public library. Before the revolution there were many religious houses.

Arles is the capital of an arrondissement containing thirty-three communes, and about 70,000 inhabitants. It was formerly the seat of an archbishop, who had for his suffragans the bishops of Marseille, Toulon, Orange, and St. Paul-trois-Châteaux—the remains of a much greater number of bishops who once acknowledged him as their metropolitan. At present, the archbishopric is united with that of Aix.

The claims of Arles to notice rest mainly upon its former greatness and its numerous existing antiquities. It is first mentioned by *Cæsar* (*de Bello Civili*, lib. i. 36, ii. 5), who built here twelve ships of war, previous to the siege of Massilia (Marseille). *Strabo* mentions it as a place of no small trade in his time. *Pomponius Mela*, a writer somewhat later than *Strabo*, describes it as one of the richest cities of the province of Gallia Narbonensis. Other authors make it a Roman colony; and it was probably from the circumstance of some of the colonists belonging to the sixth legion, that it got the name of *Arelate Sextanorum*. The name is variously written. *Arelate* is most common, but we find also *Arelas*, especially in the poets, *Arelatæ* (*Ἀρελάται*, *Strabo*), and *Arelatum* (*Ἀρελάτον*, *Ptolemy*), and in later times, *Arelatus*. The city appears to have suffered considerably from the *Allemanni* during the decline of the Roman empire, but in the early part of the fourth century it rose to greatness and distinction under the patronage of *Constantine the Great*. This prince appears to have built that part of *Arelate* which lay beyond the Rhône, and which forms in the present day the suburb of *Trinquetaille*, in the island of *La Camargue*. He gave to Arles the name of *Constantina*, which it continued to bear in the time of *Honorius* (a century later), who transferred to it the seat of the prætorian prefect of Gallia, which had previously been fixed at *Trèves*.

The dignity of Arles survived the fall of the western empire. It was the residence of a king of the *Visigoths*, and of a prefect under *Theodoric*, king of the *Ostrogoths*, who afterwards got possession of it. Under the kings of the *Franks* of the *Merovingian* family, who became masters of Arles after the *Ostrogoths*, the city declined. In the confused period which succeeded the death of *Charlemagne*, we find it giving name to a kingdom, sometimes called the kingdom of Arles, sometimes of *Burgundy*; the duration and extent of which are subject to considerable doubt. Arles passed under the dominion of the emperors of Germany, and, by the permission of *Frederic II.*, became, in 1212, a republic, governed by a chief entitled the *Podestat*, elected by the people. (It had also a chief judge, the *Viguier*, appointed by the *Podestat*, and two *Consuls*, nominated by the

Archbishop to take charge of the police. In a word, it appears to have become a municipal corporation; and under this constitution flourished to such a degree that its alliance was sought by Genoa and other commercial towns. Its independence was indeed overthrown, in the middle of the same century, by Charles I., Count of Anjou (brother of Louis IX. of France, or St. Louis), who was recognized as Lord of Arles, in feudal subjection to the emperor of Germany. Above a century after, the emperor Charles IV. appointed the dauphin, afterwards Charles VI. of France, his vicar in all the kingdom of Arles; and as the emperors quietly withdrew from all supremacy over it, the city, with its territory, came finally under the kings of France.

The antiquities of Arles are numerous and important; but the doubtful nature of some of the buildings, to which different names have been given, makes them apparently more numerous than they are, and occasions some difficulty in the description. There are the ruins of an aqueduct; of two temples, one supposed to be of Diana; of a triumphal arch; of a theatre, three columns of which make up what is called *Tour de Roland*; of a building, which is variously supposed to have been a temple of Minerva, a palace of Constantine (called *La Trouille*), and the capitol or seat of the municipal legislature; of baths, the stoves and galleries of which were discovered in digging for the foundation of the town-house and of the pedestal of the obelisk; and of urns, lacrymatoria (tear-bottles*), pateræ, lamps, and other utensils which have been obtained from the tombs. Three remains deserve a more extended notice: the obelisk, the amphitheatre, and the antient cemetery, called the Campus Elysus (Elysian Field), or, by corruption, Eliscamp.

Obelisk of Arles.

The obelisk decorates one of the squares next to the town-hall. The time when it was brought to Arles and the other circumstances attending its transport are unknown. It is of granite similar to that of the obelisks which were carried from Egypt to Rome, but is without any hieroglyphics. It appears never to have been set up in antient times, but to have lain where it was placed on being landed. For many ages, it was buried in the earth in the garden of a private individual; but was discovered in 1389, and in 1675, under the direction of the town-council, was brought from its concealment, and raised on a pedestal. It was

* So called on account of their supposed use; considered by others to have been intended for perfumes.

originally of one piece, but when dug out, was found to be broken at the point: the broken part was discovered in another place. Its dimensions are about fifty-five English feet high, and the base is about seven feet and a half square. It rests on four lions *couchant* at the four corners: the lions lie on the pedestal, which is above twenty-one feet high, and has on its four sides Latin inscriptions, containing the most fulsome panegyrics on Louis XIV., to whose honour the obelisk was erected. The summit was crowned with a globe covered with *fleur-de-lis*, and surmounted by the sun, the ensign of *Le Grand Monarque*. Whether these emblems of royalty have survived the furores of the revolution, we have not been able to ascertain; but the obelisk itself, which is the only antient part of the monument, maintains its place.

Of the amphitheatre, the circuit is yet entire; and the remains, although blocked up with houses, are sufficient to convey an idea of the former grandeur of the edifice. It consisted of three stages, the lower of which, owing to the uneven surface of the site, was for the most part under ground, except on the north and north-east, where several arches appear above ground. The inequality of the site, by thus concealing or burying the greater part of the first stage, made it necessary to place the principal entrances on the second, which contains sixty arches (including the four principal entries), the number which is also in the third stage. The parapet which surmounted the third stage has disappeared, and it is impossible to say of what kind it was. The architecture is of the Composite order. The rows of seats which surrounded the arena [see AMPHITHEATRE] have almost entirely disappeared, and the space which they once occupied, as well as the arena itself, is filled with earth to the level of the second stage, and covered with houses. Three towers have been built during subsequent wars. The once open arches of the outer wall have also been built up, and the exterior defaced and hidden by houses erected against it. This amphitheatre is built of stone, inferior in hardness and whiteness to that of the amphitheatre at Nîmes: it is less perfect than that edifice, but was capable of holding about five thousand more spectators.

The principal dimensions are thus given in Guis' *Description des Arènes ou de l'Amphithéâtre d'Arles*. 1665:—*

	English feet.
Circumference of the oval	1265 or 1245
Longer diameter, N. to S. . . .	466
Shorter do. E. to W. . . .	341 or 338
Longer do. of the arena	249 or 246
Shorter do. do. . . .	126 or 124
Breadth from the outer wall to the parapet of the arena, across the benches	110 or 109

Number of persons whom the amphitheatre would contain, above 23,000.

The measurement of the circumference given in *Le Grand Dictionnaire de Martinière* rather exceeds the above: and he gives the height of the arches in the exterior wall as above twenty-one English feet, the width as eighteen or nineteen. He adds that the walls are above two toises or about thirteen English feet thick, formed of massy blocks of stone without lime or cement to unite them; and that the amphitheatre would conveniently hold 30,000 persons.

Excavations have been made in the amphitheatre within a few years, and many antiquities discovered.

The cemetery of Campus Elysus is on a pleasant hill out of the city. It is divided into two parts. In the first of these, called *Moulaire* (from which is a beautiful prospect) the antient monumental stones have mostly been carried away to present to different individuals, or broken up to be used as building materials: but the second part, which is still called *Eliscamp*, contains several tombs, those of the Pagans being distinguished by the letters D M (*Dis Manibus*), and those of the Christians by a cross. The same causes which have led to the removal of nearly all the tombs of the other part, have materially diminished those in Eliscamp.

An antient statue, which is called by Martinière and others a statue of Venus, but which an old writer, François de Rebattu, Dean of the See of Arles (in a tract bearing date 1659), and the writer in the *Encyclopédie Méthodique*, describe as a statue of Diana, was dug up in 1651. It was found in digging a well, in several pieces; and has been

* These dimensions are to be considered as approximations rather than as rigidly exact; for the two columns, though both taken from the same author, one being reduced from the Provencal measures, canes and pans (the cane = 8 pans, and the pan = 94 in. French), and the other from French toises, feet, and inches, do not agree.

much admired. It was restored and transferred in 1684 to the gallery at Versailles, and subsequently to the gallery of the Louvre.

It is supposed that the country round Arles was by no means so marshy in the time of the Romans; the obstacles which prevent the waters from flowing into the sea or into the channel of the Rhône having arisen since.

The people of Arles are considered to have retained more than those of most other towns of the manners of antient times. One instance of their adherence is far from creditable: bullfights were kept up here till a comparatively late period. Horse and foot races are still practised. The beauty, grace, and gentility of the women are much praised.

Arles was the native place of the Emperor Constantine II. son of Constantine the Great; of Morand and Patrat, dramatists; and of Saverien, a mathematician and biographer of some merit. (*Le Grand Dictionnaire de Martinière; Géographie de la France; Encyclopédie Méthodique; &c.*)

ARLON (the Roman Orolaunum), a small town in the Duchy of Luxembourg, belonging to the King of the Netherlands, in 49° 42' N. lat., and 5° 47' E. long. It stands on a hill, near the sources of the Semoy, a branch of the Maas, fourteen miles W.N.W. of the town of Luxembourg, and between that and the town of Neufchâteau. Its population is about 3,600. It has some iron works and furnaces, a considerable corn trade, and linen and woollen manufactures. Arlon was once a town of considerable importance; it was fortified, and was taken and re-taken by the French and the Spaniards in the wars of Louis XIV. It was entirely destroyed by a fire in 1785. Arlon was the birth-place of the two learned brothers Busleyden, one of whom became cardinal and archbishop of Toledo in the time of Charles V.; the other was the founder of the College of the three languages at Louvain.

ARMA'DA. This term, which is derived from the Latin word *armata*, 'armed,' and consequently comes from the same root as the French *armée* and our *army*, is used in Spain to denote exclusively a naval armed force, or fleet of war. *Flota* is used in the same language for a fleet of merchant-men. Armado, which occurs in Shakspeare's *King John*, act iii. sc. 4, Sandys's *Travels*, p. 51, &c. is a corrupted term; so Fairfax, in the translation of *Tasso*, i. 79.

'Spread was the huge armada wide and broad.'

Ben Jonson, however, writes it correctly, Armada.

Nares, in his *Glossary*, thinks that this word was not known in England before the Spanish projected invasion in 1588; and it is now rarely used but in speaking of that particular fleet the fitting out and destruction of which form the subject of the next article.

ARMADA, SPANISH. In the beginning of May, 1588, the preparations of Philip II. for the invasion of England, which had so long kept Europe in amazement and suspense, were brought to a conclusion; and the Spaniards, in the confidence of success, previous to its sailing, gave their fleet the name of the Invincible Armada. It consisted, at this time, of 130 vessels: 65 of these were galleons and larger ships; 25 were pink-built ships; 19 tenders; 13 small frigates; 4 were galleasses; and 4 galleys. The soldiers on board amounted to 19,295, the mariners to 8050; of these, 3330 soldiers and 1293 mariners had been supplied by Portugal: besides which, the rowers in the galleasses amounted to 1260, and in the galleys to 888. There were also on board 2431 pieces of artillery, and 4575 quintals of powder: 347 of the pieces of artillery had likewise been supplied by Portugal. Two thousand volunteers of the most distinguished families in Spain, exclusive of the sailors and soldiers already mentioned, are stated to have accompanied the expedition.

Philip's preparations, in the Netherlands, of a further force, were not less advanced than those of Spain. Besides a well-appointed army of 30,000 foot and 4000 horse, which the Duke of Parma had assembled in the neighbourhood of Nieuport and Dunkirk, that active general had provided a number of flat-bottomed vessels, fit for transporting both horse and foot, and had brought sailors to navigate them from the towns in the Baltic. Most of these vessels had been built at Antwerp; and, to prevent the Dutch from intercepting them should they pass by sea, they were sent along the Scheldt to Ghent, thence by the canal to Bruges, and so to Nieuport by a new canal dug for the particular occasion. This laborious undertaking, in which several thousand workmen had been employed, was already finished, and the

duke now only waited for the arrival of the Spanish fleet; hoping that, as soon as it should approach, the Dutch and English ships, which cruised upon the coast, would retire into their harbours.

The details of the regular force which the English assembled to oppose the Armada, both by sea and land, are minutely given in a manuscript now in the British Museum (*MS. Reg. 18 C. xxi.*), formerly belonging to the Royal Library. At the time when Queen Elizabeth began her preparations, her fleet did not amount to more than thirty ships, none of them near equal in size to those of the enemy. Ultimately, however, the different descriptions of vessels, large and small, which formed her navy, amounted to 181 ships, manned by 17,472 sailors. The military force consisted of two armies, one for immediately opposing the enemy, under the Earl of Leicester; the other for the defence of the queen's person, commanded by Lord Hunsdon. The army appointed for the defence of the queen's person amounted to 45,362, besides the band of pensioners, with 36 pieces of ordnance. Lord Leicester's army amounted to 18,449; the total of both armies to 63,511, besides 2000 foot who were expected from the Low Countries. The forces of the Presidenship of the North remained stationary, in case anything should be attempted on the side of Scotland; as were also the forces of the Presidenship of Wales.

The Armada was to have left Lisbon in the beginning of May, but the Marquess de Santa Cruz, who had been appointed admiral, at the moment fixed for the departure was seized with a fever, of which he died in a few days; and by a singular fatality, the Duke de Paliano, the vice-admiral, died likewise at the same time. Santa Cruz was reckoned the first naval officer in Spain; and Philip found it extremely difficult to supply his place: he at last filled it with the Duke de Medina Sidonia, a nobleman of high reputation, but entirely unacquainted with maritime affairs. Martinez de Recaldo, however, a seaman of great experience, was made vice-admiral.

In these arrangements so much time was lost, that the fleet could not leave Lisbon till the 29th of May. It had not advanced far in its voyage to Corunna, at which place it was to receive some troops and stores, when it was overtaken by a violent storm and dispersed. All the ships, however, reached Corunna, La Coruña (the Groyne, as it is called by our historians and sailors), though considerably damaged, except four. They were repaired with the utmost diligence, the king sending messengers every day to hasten their departure; yet several weeks passed before they were in a condition to resume the voyage.

In the mean time a report was brought to England that the Armada had suffered so much by the storm as to be unfit for proceeding in the intended enterprise; and so well attested did the intelligence appear, that, at the queen's desire, Secretary Walsingham wrote to the English admiral, requiring him to lay up four of his largest ships and to discharge the seamen. Lord Howard was happily less credulous on this occasion than either Elizabeth or Walsingham, and desired that he might be allowed to retain these ships in the service, even though it should be at his own expense, till more certain information were received. In order to procure it, he set sail with a brisk north wind for Corunna, intending, in case he should find the Armada so much disabled as had been reported, to complete its destruction. On the coast of Spain he received intelligence of the truth: at the same time, the wind having changed from north to south, he began to dread that the Spaniards might have sailed for England, and therefore returned without delay to his former station at Plymouth.

Soon after his arrival Lord Howard was informed that the Armada was in sight. He immediately weighed anchor, and sailed out of the harbour, still uncertain of the course which the enemy intended to pursue. On the next day he perceived them steering directly towards him, drawn up in the form of a crescent, which extended seven miles from one extremity to the other. Plymouth was at first supposed to be the place of destination; but it was soon apparent that the Duke de Medina adhered to the execution of the plan which had been laid down for him by the court of Madrid. This was, to steer quite through the Channel till he should reach the coast of Flanders, and, after raising the blockade of the harbours of Nieuport and Dunkirk by the English and Dutch ships, to escort the Duke of Parma's army to England, as well as land the forces which were on board his own fleet. Lord Howard, instead of coming to close and

unequal fight, contented himself with harassing the Spaniards on their voyage, and with watching attentively all the advantages which might be derived from storms, crosswinds, and other accidents. It was not long before he discerned a favourable opportunity of attacking the vice-admiral Recaldo. This he did in person; and on that occasion displayed so much dexterity in working his ship, and in loading and firing his guns, as greatly alarmed the Spaniards for the fate of their vice-admiral. From that time they kept closer to each other; notwithstanding which, the English on the same day attacked one of the largest galleasses. Other Spanish ships came up in time to her relief, but in their hurry, one of the principal galleons, which had a great part of the treasure on board, ran foul of another ship, and lost one of her masts. In consequence of this misfortune she fell behind, and was taken by Sir Francis Drake; who, on the same day, took another capital ship, which had been accidentally set on fire. Several other rencontres happened, and in all of them the English proved victorious. Their ships were lighter, and their sailors more dexterous, than those of the Spaniards. The Spanish guns were planted too high, while every shot from the English proved effectual. The Spaniards, however, still continued to advance till they came opposite to Calais, where the Duke de Medina, having ordered them to cast anchor, sent information to the Duke of Parma of his arrival, and entreated him to hasten the embarkation of his forces. But the duke, though he embarked a few of his troops, informed Medina that the vessels which he had prepared were proper only for transporting the troops, but were utterly unfit for fighting; and for this reason, till the Armada was brought nearer, and the coast cleared of the Dutch ships which had blocked up the harbours of Nieuport and Dunkirk, he could not stir from his then station (at Bruges) without exposing his army to certain ruin. In compliance with this request, the Armada was ordered to advance; and it had arrived within sight of Dunkirk, between the English fleet on one hand and the Dutch on the other, when a sudden calm put a stop to its motions. In this situation the fleets remained for a whole day. About the middle of the night of August the 7th a breeze sprung up, and Lord Howard had recourse to an expedient which had been planned the day before. Having filled eight ships with pitch, sulphur, and other combustible materials, he set fire to them, and sent them before the wind against the different divisions of the Spanish fleet. The Spaniards beheld these ships in flames approaching them with great dismay: the darkness of the night increased their terror, and the panic flew entirely through the fleet. The crews of the different vessels, anxious only for their own preservation, thought of nothing but how to escape from immediate danger. Some weighed their anchors, whilst others cut their cables, and suffered their ships to drive before the wind. In this confusion many of the ships ran foul of one another, and several of them received such damage as to be rendered unfit for future use.

When daylight returned, Lord Howard had the satisfaction to perceive that his stratagem had produced the desired effect. The enemy were still in extreme disorder, and their ships widely separated and dispersed. His fleet having received a great augmentation by the ships fitted out by the nobility and gentry, as well as by those of Lord Seymour, who had left Justin de Nassau as alone sufficient to guard the coast of Flanders, and being bravely seconded by Sir Francis Drake and all the other officers, he hastened to improve the advantage which was now presented to him, and attacked the enemy in different quarters at the same time with the utmost impetuosity and ardour. The engagement began at four in the morning of August the 8th, and lasted till six at night. The Spaniards in every rencontre displayed the most intrepid bravery; but, from the causes already mentioned, did little execution against the English, while many of their own ships were greatly damaged, and ten of the largest were either run aground, sunk, or compelled to surrender.

The principal galleass, commanded by Moncada, having Manriquez, the inspector-general, on board, with 300 galley-slaves and 400 soldiers, was driven ashore near Calais. Fifty thousand ducats were found on board of her. One of the capital ships, having been long battered by an English captain of the name of Cross, was sunk during the engagement. A few only of the crew were saved, who related that one of the officers on board having proposed to

surrender, he was killed by another who was enraged at his proposal; that this other was killed by the brother of the first; and that it was in the midst of this bloody scene that the ship went to the bottom. The fate of two other of the Spanish galleons is particularly mentioned by contemporary historians, the St. Philip and St. Matthew: after an obstinate engagement with the English admiral's ship, they were obliged to run ashore on the coast of Flanders, where they were taken by the Dutch.

The Duke de Medina now not only despaired of success but saw clearly that by a continuance of the combat he should risk the entire destruction of his fleet. The bulk of his vessels rendered them unfit not only for fighting but for navigation in the narrow seas. He therefore determined to abandon the further prosecution of his enterprise; yet even to get back to Spain was difficult: he resolved, therefore, to sail northwards, and return by making the circuit of the British isles. Lord Seymour was detached to follow in his rear, but from the bad supply of ammunition which he had received from the public offices, was deterred from renewing an attack which, in all probability, would have led to the Duke de Medina's surrender.

A dreadful storm arose, after the Spaniards had rounded the Orkneys, and the whole fleet was dispersed. Horses, mules, and baggage, were thrown overboard to lighten a few of the vessels. Some of the ships were dashed to pieces on the rocks of Norway; some sunk in the middle of the North Sea; others were thrown upon the coasts of Scotland and the Western Isles—the wreck of one being still visible, it is said, at Tobermoray, in the Isle of Mull; and more than thirty were driven by another storm, which overtook them from the west, on different parts of the coast of Ireland. Port na Spagna, on the coast of Antrim, near the Giants' Causeway, obtained its name from this circumstance. (See *Trans. of Geol. Soc.* vol. iii. plate 10.) Of these, some afterwards reached home in the most shattered condition, under the vice-admiral Recaldo; others were shipwrecked among the rocks and shallows; and of those which reached the shore many of the crews were barbarously murdered, from an apprehension, it was pretended, that in a country where there were so many disaffected Catholics it would have been dangerous to show mercy to so great a number of the enemy. Camden says, 'They were slain, some of them by the wild Irish, and others put to the sword by command of the lord-deputy; for he, fearing lest they would join with the Irish rebels, and seeing that Bingham, governor of Connaught, whom he had once or twice commanded to show rigour towards them as they yielded themselves, had refused to do it, sent Fowl, deputy-marshal, who drew them out of their lurking-holes and hiding-places, and beheaded about two hundred of them.'

The Duke de Medina having kept out in the open seas, escaped shipwreck; and, according to the official accounts, arrived at Santander in the Bay of Biscay about the end of September, 'with noe more than sixty sayle oute of his whole fletee, and those verye much shattered.'

Strype, in his *Annals*, reckons the Spanish loss upon the coast of England to have amounted to fifteen ships and above 10,000 men, besides seventeen ships and 5394 men sunk, drowned, and taken upon the coast of Ireland.

The statements, however, published at the time apparently upon authority, say, 'In July and August, ships 15, men 4791; sunk, &c., upon the coast of Ireland, 17 ships, 5394 men: making a total of 32 ships, and 10,185 men.'

There is a very curious work relating to the Spanish Armada preserved in the King's Library at the British Museum; a volume of extreme rarity, which was finished at Lisbon, May 9, 1588, while the fleet was in the port of that place prepared for the expedition, entitled *La Felicissima Armada, que el Rey Don Felipe nuestro Señor mandó juntar en el puerto de la Ciudad de Lisboa, en el Reyno de Portugal, el Año de mil y quinientos y ochenta y ocho; hecha por Pedro de Paz Salas*, fol. Lish. 1588; por Antonio Alvarez, Impressor. This copy in the King's Library was the identical one which was procured at the time of its publication for Lord Burghley, to acquaint him with the true detail of all the preparations; and he has noted in his own hand, in the margins of different pages, a variety of particulars relating to the defeat. In one instance, he has noted the change of a commander from one Spanish vessel to another different vessel. The following are a few of Lord Burghley's notes:—

Galeon S. Phelippe; taken at Flushyng, 31 July. D. Francisco de Toledo; this man escaped into Nuport.

La Nao Capitana; 'this shipp was taken by Sir Francis Drake.' *El Gran Grifon Capitana*; 'this man's ship was drowned, 17 September, in the Ile of Furemare, Scotland.' *Barca de Amburg*; 'she was drowned over against Ireland.' *San Pedro Mayor*; 'wrecked in October, in Devonshire, neare Plimmouth.' *La Galeaça Capitana nombrada S. Lorenzo*; 'this was drowned afor Callys.'

The following entries perhaps afford an explanation of the lord-deputy's barbarous conduct in Ireland. Members of some Irish families were on board the Spanish fleet:—

Admundio Estacio; 'brother to James Eustace, Viscount Baltyglass.' Don Carlos Oconor; 'of Offolly, sonn to old Oconore.' Tristan Vinglade; 'Wynsland.' Ricardo Beree, Roberto Laseo, Christoval Lombardo; 'of Mounster.'

The copy of this work in the Royal Library, from which a few particulars in the earlier part of the preceding account have been taken, is accompanied by twelve charts of the coast of England, showing the different situations of the Spanish Armada and the English fleet through the whole of the contest. This also, which is a separate work, is of very rare occurrence, entitled *Expeditionis Hispanorum in Angliam Vera Descriptio*, Anno Do. MDLXXXVIII. published by Robert Adam, and engraved by Augustin Ryther. The different actions and positions represented in these charts are minutely explained in a quarto tract, printed by A. Hatfield in 1590, and sold at Augustin Ryther's shop, entitled *A Discourse concerning the Spanish Fleet invading England in the yeere 1588*,—a copy of which is also preserved in the library of the British Museum.

Camden, speaking of this great victory, says, 'Whereupon several monies were coined, some in memory of the victory, with a fleet flying with full sails, and this inscription, *Venit, vidit, fugit*, "It came, it saw, it fled;" others in honour of the queen, with fire-ships and a fleet all in confusion, inscribed, *Dux femina facti*, that is, "A woman was conductor of the exploit." The medals and jettons, however, which were struck on this occasion, were entirely Dutch. None were struck in England. The most remarkable of considerable size is that which represents the Spanish fleet upon the obverse, with the words *Plavit Jehovah et dissipati sunt*, 1588, 'Jehovah blew and they were scattered.' Reverse, a church on a rock, beaten by the waves, *Allidor non ledor*. These, and one or two more, will be found in the *Histoire Médallique des Pays-Bas*, tome i. p. 383-386; and in Pinkerton's *Medallie History of England*, pl. viii. no. 7, 8; pl. ix. no. 1, 6.

Philip II. published two jettons, with the inscription, *Immensi Tremor Oceani*, 1587 and 1588.

It is usually said that the circulation of an English newspaper first began in 1588, when *The English Mercurie* was 'published by authoritie for the prevention of false reports.' Copies of several of these Mercuries, dated Whitehall, July 23d, July 26th, and Nov. 24th, are preserved among Dr. Birch's historical collections in the British Museum; but as they are marked as Nos. 50, 51, and 54 in the corner of the margin, we are to conclude that such publications had occasionally been resorted to at critical times, much anterior to the event of the Spanish Armada.

The chief details in the preceding account have been drawn from Camden's *History of Elizabeth*; Strype's *Annals of the Church*; Ellis's *Original Letters*; and Watson's *History of Philip II.*

ARMADILLO (*Dasyurus*, Linnæus), in zoology, a genus of mammals belonging to the order *Edentata*, and forming, with the allied genera *Chlamyphorus* and *Orycteropus*, a small but very distinct family intermediate between the sloths and ant-eaters, and characterized by the possession of molar teeth only. The sloths, on the contrary, as has been shown in the article *AI*, have not only the ordinary molar teeth of common quadrupeds, but are likewise provided with large and powerful canines; though, as far as we know anything of their economy, they appear to be a purely herbivorous family, and to be even incapacitated by other details of their organization for the capture or destruction of a living prey; whilst the ant-eaters, as we have seen under that article, are not only deprived of canine, but likewise of molar teeth; consequently, are without teeth of any description, and thus form the only family of the order *Edentata* that literally answers to the name and definition. Nor are these the only distinctions which subsist between the three families of edentatous mammals which we have here indicated. Others have been already pointed out in the articles just referred to, and it will be sufficient to mention, in ad-

dition, that the ant-eaters differ from the other two families by the want of clavicles, a most important and influential element in the anatomical structure of all vertebrated animals, and the armadillos, the more immediate subject of our present consideration, by the peculiar nature of their external covering. 'When we speak of a quadruped,' says the eloquent Buffon, 'the very name carries with it the idea of an animal covered with hair, as that of a bird or a fish suggests the corresponding ideas of feathers or scales respectively, as attributes inseparable from these beings; yet nature, always more fertile in her resources than we are skilful in tracing her relations or appreciating her designs, escapes at every moment from our most extensive observations, and astonishes us by her exceptions, still more than by her general laws.' A remarkable instance of the truth of these observations is presented by the genus of quadrupeds which we are about to consider. Instead of hair, the armadillos are covered with a species of hard bony crust, forming three bucklers on the head, shoulders, and rump, respectively, the two latter being connected by a number of transverse moveable bands, very similar in form and appearance to the plate armour of the middle ages, from which indeed these animals have acquired the name of armadillos, a name of Spanish origin, which has been adopted by English writers. These bucklers likewise hang down on each side, so as to form an effectual protection to the belly, and partially to cover the legs and feet; whilst the pliancy produced by the moveable bands interposed between the bucklers of the rump and shoulders, and which are themselves connected by the soft pliant skin of the animal, permits the most varied and rapid motions. The bucklers themselves, as well as these connecting moveable bands, are composed of numerous small polygonal plates, placed contiguous to one another like the stones of a mosaic pavement, but without any actual articulation, and they are incapable of separate motion. The whole thus forms a kind of shelly buckler not unlike that of a lobster; and though incapable of actual motion, yet the thinness of the shell, and, during life, the pliancy occasioned by the animal oil which penetrates it, allow it to yield to a certain degree, and thus to accommodate itself in some measure to the motions of the body. But the great and principal motions, as already observed, are entirely due to the moveable transverse bands, interposed between the two principal bucklers of the body, and which vary in number according to the species, and even within certain limits according to the age, sex, or individual. These are situated immediately above the loins, or in the region to which all the principal motions of the animal economy have been assigned; the bucklers of the head and shoulders are entirely disunited, and have none of these moveable bands interposed between; but that of the head projects considerably backwards, and affords complete protection to the neck, which is indeed so short as to be barely distinguishable. We have in former articles had repeated occasion to speak of the megatherium, and to point out the analogies which that singular extinct animal bore to the sloths and ant-eaters. Here again it presents itself to our notice under a new point of view, and in fact it appears to have been a kind of connecting link between the most opposite and incongruous animals, and to have had a more or less intimate relation to every known genus of *Edentata*. It was but very lately, however, that we had reason to suspect that it presented any very close affinity to the armadillos in particular, other at least than the general want of incisor teeth, which forms the distinguishing characteristic of the order to which both these genera belong; but the recent discovery of fossil bones of the megatherium in the republic of Buenos Ayres has made us acquainted with a new and unexpected analogy between these animals. The bones in question were accompanied by the fragments of a buckler, of very large dimensions, manifestly belonging to the same animal, and perfectly similar in structure and appearance to that of the armadillos. This discovery was alone wanting to enable us to form a perfect and correct idea of the most remarkable inhabitant of the antediluvian world.

The throat, breast, belly, and thighs, of the armadillo are naked, or covered with a thick granulated skin, thinly furnished with warts or tubercles, which give origin to a few coarse, bristly hairs. The commissures of the moveable bands on the loins are likewise provided with a number of long hairs; but, with this exception, the body is covered only by its peculiar shell. The tail is straight, round, thick, and pointed; it is adapted, at the root, to a

notch or cavity in the posterior edge of the buckler of the croup, and, with the exception of one species, is universally covered with bony rings, formed, like the rings of the bucklers, of numerous small pieces connected together, but capable of a certain degree of motion, and thus admitting of considerable flexibility in the tail itself. The head of the armadillos is flat, and terminated by a pointed muzzle, which assists them, like the snout of the hog and mole, to turn up the earth in search of roots and worms. Their ears are erect and pointed, and their eyes very small. They have flat, corpulent bodies; and their legs are so disproportionately thick and short, that they barely serve to elevate the body above the surface of the ground. Their toes, also, of which there are either four or five on the anterior and invariably five on the posterior extremities, are remarkably short, but they are furnished with extremely long powerful claws, slightly curved, and in every respect well adapted for digging or burrowing. So rapid indeed are the armadillos at this operation, that they easily bury themselves to any depth beyond the reach of their pursuers. They can only be forced from their subterranean retreat by directing smoke or water into their burrows: their strength and the tenacity of their hold are so great, that they have been known to leave their tails in the hands of the hunter, rather than permit themselves to be drawn forth. Yet, notwithstanding the shortness of their legs, and the heavy corpulent make of their bodies, the armadillos run with a velocity which could not be anticipated from their general appearance. Most of the species will easily outstrip a man. Their ordinary burrows most commonly run for three or four feet, at an angle of about 45° to the plane of the horizon, then make a sudden bend, and terminate at the distance of eight or ten feet from the mouth. Here, for the most part, they conceal themselves during the day-time; for the greater number of the species are nocturnal, and never move abroad whilst the sun is above the horizon. This rule, however, admits of some exceptions—a few species being found abroad at all times indifferently; and it has been remarked that these are neither so swift nor so timid as the nocturnal species.

The teeth of the armadillos are all of a simple cylindrical form, and stand apart from one another like those of the generality of cetacea and reptiles. They vary in number, from seven or eight to seventeen or eighteen on each side of each jaw; and are so arranged, that when the mouth is closed, the upper teeth fit into the interstices of the under, and these into the interstices of the upper teeth alternately. The animals never attempt to bite, nor has nature given them any other means of defence than the ease and rapidity with which they avoid danger by burrowing. Their food consists principally of fallen fruits, roots, and worms; but they do not reject carrion, and have been known to penetrate into graves, when not properly protected by stones or brick-work. Azara informs us that ants are never found in the districts inhabited by the armadillos, and that these animals break into the ant-hills, and devour the insects as greedily as the true ant-eaters. Nature, it is true, has not provided them with the same apparatus for this purpose, but the armadillos may, notwithstanding, destroy vast quantities of ants, though it is probable that they expel them from their own peculiar districts as much at least by destroying the habitations as by actually devouring the insects themselves. The ordinary food of the armadillos consists chiefly of the roots of the manioc, of potatoes, maize, and other similar substances of a vegetable nature, though, as already observed, without rejecting animal substances naturally soft or so far decomposed as to be easily torn without the help of canine teeth. They are also very destructive to the eggs and young of such birds as build their nests on the ground, and greedily devour worms, frogs, small lizards, and, M. d'Azara says, even vipers. The chief animal food of the armadillos, however, is derived from the immense herds of wild cattle which cover the plains and savannas of every part of South America. These are rarely slaughtered but for the sake of the hide and tallow; and as the carcasses are left to rot on the pampas or plains, the smell soon attracts vast crowds of carnivorous animals of various species, and among others, great numbers of armadillos, which greedily devour the half-putrid flesh, and soon become extremely fat and corpulent. In this condition, notwithstanding the filthy nature of their food, their flesh is esteemed a great delicacy, both by the native Indians and by the Portuguese and Spaniards of

America. The animal is roasted in its shell, and considered one of the greatest dainties which the country produces.

The armadillos see but indifferently, particularly in bright sunshiny weather; but their sense of hearing is extremely acute, and amply compensates for any imperfection of sight. When alarmed by any unusual or strange sound, they prick up their ears, stop for a moment to satisfy themselves of its distance and direction, then commence a precipitate retreat to their burrow, or, if that be too remote, begin to construct a new one. Smell is, however, by far the most acute of their senses. Azara tells a singular story, which strikingly illustrates the intensity of this sense in the armadillos, as well as the unerring certainty with which, by a kind of intuitive knowledge of the principles of engineering, they are enabled to direct their subterraneous course to any particular point. 'My friend Noséda,' says he, 'having arranged a trap for the purpose of taking chibigouzous, and having placed in it, by way of bait, a cock, with a small quantity of maize to support him, it so happened that a few grains of the maize fell through between the boards which formed the bottom of the trap. An armadillo arrived during the night, and wishing to get at the maize thus accidentally spilt, opened a trench or burrow at some distance from the trap, and without deviating a hair's breadth from the straight line of his direction, pushed it on to the very spot where the grain had fallen, and possessed himself of the booty.'

It is generally believed that the female armadillo brings forth but once during the year, but she produces at a birth frequently six, eight, or even ten, young ones; yet she has never more than four teats, and, according to the report of M. Azara, the most accurate and extensive observer who has written upon the history of these animals, in some species only two,—an anomaly, with respect to the number of young and the number of teats, which appears to contradict the general rule observable among other mammals. Azara, indeed, supposes that some of the young die for want of proper nourishment, and that the mother only rears those for which she has a sufficient supply of milk. In support of this supposition he adduces the instance of a female armadillo in the possession of an acquaintance, which produced nine young ones at a birth, out of which three died shortly afterwards, and the remaining six were nursed by the mother. This was no doubt true in this particular instance, but it is difficult to believe that the rule can be generally true, or that so complete a contradiction, as such a phenomenon would indicate, can possibly subsist between the functions and structure of organs in other respects so intimately allied to one another as the matrix and the mammae. The only actual anomaly, or exception to the general rule which subsists among other animals, is to be found in the disproportion subsisting between the number of teats and the number of young produced at a time; and this is more apparent than real, since we can easily conceive that two or even more young ones may be supported by a single teat.

The tropical and temperate regions of South America are the original and proper habitat of all the known species of armadillos. Ignorant or careless writers, it is true, have frequently mentioned them as natives of Asia and Africa, but such mistakes probably arise from confounding these animals with the pangolins (*manis*), or scaly ant-eaters of the Old World, a very different genus, and more nearly allied to the true ant-eaters than to the present genus in all respects save the horny nature of the covering which supplies the place of hair, and even this differs essentially in its character from the bucklers of the armadillo. The armadillos are active, hardy animals, and thrive and breed rapidly with a moderate portion of care in most temperate countries. Such of the species as prefer a vegetable food, and whose flesh is consequently the most palatable and wholesome, might even be domesticated with advantage, and bred in warrens, like rabbits. In their native climates, however, they still abound in such incredible numbers, that the inhabitants will not be at the trouble of rearing what they can so readily procure to any required amount. When, therefore, the natives of Brasil or Buenos Ayres maintain the armadillo as a domestic animal, it is more for curiosity than for profit: the woods and pampas supply the wild animal in inexhaustible abundance. They are most usually taken in traps during the night; or, when found in open day at any distance from their burrows, are pursued by small dogs, which intercept their retreat till the hunter has time to secure them. One species only, when

thus attacked, has the faculty of rolling itself up in a round ball like a hedge-hog, but they are generally timid and extremely helpless, and none ever attempt to defend themselves either by using their teeth or claws.

Up to the year 1801, the period of the publication of Don Feliz Azara's *Essays on the Natural History of the Quadrupeds of Paraguay*, a work invaluable for the numerous original and acute observations which it contains upon this department of zoology, the various writers upon this subject had distinguished the different species of armadillos from one another by the comparative number of the moveable bands which separate the bucklers of the croup and shoulders. Azara, however, showed that the number of these bands is by no means, as had been heretofore supposed, constant in the same species, but that within certain prescribed limits this number varies continually according to the age and sex of the individual, and consequently that it is necessary to seek in other characters for more definite and certain means of distinguishing the species. 'Of all the species,' says this author, 'which I have described, I have had individuals of the second, fourth, and seventh, with both six and seven bands each; of the fifth I have seen individuals with six, seven, eight, and even nine bands; of the sixth with five, six, and seven bands; and although, having encountered but few individuals of the other species, I cannot affirm the same thing so positively of them, yet I have no doubt but that they are subject to the same variation as the others.' These observations of Azara have rendered it necessary to look for other and less variable characters of specific distinction; and accordingly Baron Cuvier, for greater facility of definition, has divided the whole genus into five small groups, principally distinguished from one another by the number and form of their teeth and claws. After the example of Buffon, he and other French zoologists employ the name of *tatu*, or *tatou*, by which these animals are distinguished among the Guarani Indians, the aboriginal inhabitants of Paraguay and the southern provinces of Brazil, instead of the more common and certainly very appropriate name of armadillo, by which they are known to English and Spanish writers. The first of Baron Cuvier's subdivisions,

1. The CACHICAMES, have four toes on the anterior and five on the posterior extremities, seven teeth only on each side both of the upper and lower jaw, a pointed muzzle, and a long tail, surrounded by a succession of osseous rings, each of which is composed of a number of polygonal plates arranged in numerous series. The two middle claws are excessively large and of equal length; the lateral, particularly the internal, which represents the thumb, are much shorter, but all are powerful, trenchant, and well fitted for burrowing. To this division belongs

1. *The peba* (*D. peba*, Desmarest), called by the Guaranis *tatouhou*, or *black tatu*, is extremely common in Paraguay, though it does not extend to the province of Buenos Ayres. This species is well figured in the original edition

of Buffon's celebrated *Histoire Naturelle*, and described by Daubenton under the name of *cachicame*, which, according to Grmilla, is the generic name of the armadillos among

the Indians on the banks of the Orinoco. Azara called it the black armadillo, from its Guarani name; and it has been admitted into the generality of zoological catalogues under the somewhat ambiguous appellations of *Dasyurus novemcinctus*, *D. octocinctus*, and *D. septemcinctus*, three different species being thus formed from the same animal, under the erroneous supposition that the number of moveable bands between the bucklers of the shoulders and croup was variable in the same species.

The length of the peba, from the snout to the origin of the tail, is about sixteen inches, that of the tail fourteen, and its circumference at the base six inches. The head is small, long, and straight; the nose extremely elongated, taper, and terminated by a sort of small muzzle something resembling the snout of a hog; the mouth is large; the eyes small, and placed on the sides of the head; the ears long, and placed close together; the tail long and attenuated; the legs short; and the feet small. The buckler of the shoulders extends in front over the whole neck, and towards the rear as far as the back, descending on each side to the elbows. It is composed of small pieces adhering to one another, and disposed in numerous parallel concentric rings, having the concavity towards the front, the first ring embracing the neck of the animal. The buckler of the croup extends from the back to the origin of the tail, and descends on each side to the knees. It is composed, as in the former case, of small pieces arranged in a great number of parallel concentric rings, passing transversely over the hips, but having their concavity turned in the opposite direction from that of the rings on the shoulder, or in such a manner that the last embraces the root of the tail. When viewed externally, the little pieces composing these bucklers have the appearance of irregular tubercles, but when examined on the under side of the buckler they are found to be hexagons almost as regular as those of the cells of bees, and fitted as precisely to one another. Between the bucklers of the shoulders and croup are interposed a variable number of transverse moveable bands marked with zig-zag lines forming very acute angles, and in some degree gliding over one another according to the different motions of the animal. Out of fourteen individuals examined by Azara, there were two with six of these moveable bands, one with seven, seven with eight, and four with nine; and it was observed that the full-grown ones always had the greatest number of bands, which renders it extremely probable that new bands are detached from the bucklers as they are required by the increasing growth of the animal. The buckler of the head descends from the ears to the muzzle, and covers each cheek as far down as the orbits; and there are small detached scales interspersed in various situations over the throat, the under-jaw, the legs, and feet, and even on the outer face of the ears. The tail is extremely long and taper: it is composed of a great number of osseous rings forming a long tubular case, and connected like the joints of a cane. The peba, or, as it is commonly called in Brazil, tatu-peba, has thirty-two teeth eight on each side both of the upper and under jaws. It inhabits Guiana, Brazil, and Paraguay, is a timid nocturnal animal, tolerably swift-footed, and very expert in burrowing; it is never found in the woods, but delights in the open plains and cultivated fields, and is much hunted by the inhabitants on account of the delicacy of its flesh, which, when roasted in the shell, is fat and well tasted: it is said to resemble that of a sucking pig.

2. *The mule armadillo* (*D. hybridus*, Desmarest), called *Mbouriqua*, or mule tatu, by the Guaranis, in allusion to its long upright ears, differs from the last species principally by its smaller size, and the comparative shortness and smallness of its tail. The length from the nose to the origin of the tail is stated by Azara to be only eleven inches and a quarter; the tail itself is six inches and a quarter long, and three inches in circumference at the root; whence it appears that the tail of the present species is only half the length of the body, whilst in the tatu-peba its dimensions are very nearly equal. The legs of the present species are also rather shorter than those of the peba, the body is broader and less covered with hair on the under surface, and the moveable bands generally fewer in number, and capable of being separated to a greater distance from one another. Their number generally varies from five to seven without distinction of sex, but it is to be observed, that the former number is only found in very young animals; and altogether the small size and general external resemblance of the two species make it sometimes difficult to distinguish

between the adult *M'bouriqua* and the young *peba*, especially if great attention be not paid to the comparative length of the body and tail, which forms the only certain criterion. This species inhabits the open uncovered country, like the former, but extends much farther south, and is common on the pampas of Buenos Ayres. It differs from the *peba* more by its habits than in external form, for it is not nocturnal, nor does it burrow with the same facility as that species. The female brings forth from eight to twelve young ones about the beginning of October, and it is a common belief among the country people, confirmed, in one instance, by an actual dissection performed by Azara, that the individuals of a particular litter are invariably of the same sex.

3. The *tatu verdadeiro* (*D. verdadeiro*) is a species very similar in size and proportions to the mule armadillo; but the point of its tail is terminated by a horny case of a single piece; the moveable bands are broader, and the plates of the croup buckler are of considerably larger size. We know very little more about this species than the few characters here reported. It inhabits the woods of Brazil, resides in burrows, and is found abroad at all hours during the day-time. Koster is the only traveller who mentions this animal, but Baron Cuvier had an opportunity of establishing its specific distinctions, by the examination of some specimens brought to France by M. Auguste de St. Hilaire.

II. The second subdivision which Baron Cuvier establishes among the armadillos, and which he calls *APARS*, is characterized by having the claws and teeth in all respects similar to those of the preceding, save that the number of the latter amounts to nine or ten on each side both of the upper and lower jaws; but the animals of the present group are immediately distinguishable from all others of the genus by the faculty which they possess of completely rolling themselves up like a hedgehog into a round ball, in which situation they may be tumbled about, or even, it is said, thrown over precipices, without receiving any material injury. There is but a single known species.

[The Mataco. *D. Apar*.]

4. The *Mataco* (*D. apar*, Desmarest, and *D. tricinctus*, Linnæus), called also *Bolita*, or the little ball, from its faculty of assuming a spherical form, is nearly fifteen inches long from the nose to the origin of the tail; the head is three inches long, and the tail not quite two inches and a quarter. The head is oblong and of a pyramidal form; the muzzle pointed; the ears short and nearly round; and the legs and claws comparatively smaller and weaker than in the other species; the tail also is much shorter, and does not taper so much; it is flattened at the root, and covered above with a rough granular crust. The small pieces which compose the bucklers and moveable bands are themselves of very irregular figures, and disposed in a more confused manner than in other species, bearing no distant resemblance to a number of small rough fragments of stones thrown at random over the surface. The buckler of the shoulders forms a prominent angle on each side which advances forwards over the cheek; it is composed of nine or ten parallel bands of small plates, of a polygonal figure, except those of the last row, which, like the plates of the

moveable bands, form irregular parallelograms. The buckler of the croup is composed of thirteen transverse rows of small plates, similar to those of the shoulders, and between the two bucklers are interposed three moveable bands only; a number by which the *mataco* is readily distinguishable from all other armadillos, though it is probable that it may vary in a small degree, as it is found to do in other cases. Its usual resource, and only defence when frightened or surprised, is to roll itself up; for it does not construct burrows like the *tatu peba*, nor does it possess sufficient speed to escape by flight. It is found in Brazil, Paraguay, and Buenos Ayres, but is nowhere very common.

III. The *EUCOUBERTS*, or third division of Baron Cuvier have five toes on the fore feet, and nine or ten teeth throughout, but they are principally distinguished by having two teeth in the intermaxillary bones of the upper jaw, representing, as it were, the incisor teeth of ordinary mammals, and thus forming an exception, not only to the other armadillos, but even to the order of *edentata*, which are principally characterised by their want of teeth of this description.

5. The *poyou* (*D. Eucoubert*, Desmarest, *D. Sexcinctus*, Linnæus), or yellow-footed armadillo (for thus Azara interprets the name), measures about sixteen inches from the nose to the origin of the tail, which is itself about half the length of the body. The head is large, flat, and nearly triangular, the face short, the muzzle obtuse, the ears erect and of moderate size, and the eye small. The number of moveable bands varies from seven to eight, according to the individual; the tail is surrounded at its base with three or four bony rings, but throughout the rest of its length it is merely covered with regular tuberculous scales; the interstices of the moveable bands give origin to a great number of long, bristly, grey hairs, and the female is provided with only two pectoral mammae. But independently of all other considerations, the *tatu-poyou* is easily distinguished from all the other armadillos by the unusual flatness and broadness of its body, and the consequent comparative shortness of its legs. It is very common in Paraguay, and burrows in the ground with an almost incredible agility. Its strength and activity are very remarkable; and notwithstanding the shortness of its legs, it runs so swift, that few men can outstrip it.

[The Poyou. *D. Eucoubert*.]

It is of a restless, unquiet character, bold, curious, and in trepid; when any noise is made at the entrance of its burrow, or when otherwise tormented, it grunts like a young pig, and comes forth without fear to investigate the cause; yet when actually attacked it is incapable of making any sort of defence, and can only save itself by retreating to the bottom of its hole, or burrowing to a still greater depth. The *poyou* feeds much upon carrion, and for this reason its flesh, though fat, is never eaten by the inhabitants of European origin, though the Indians make no distinction in this respect between it and the other armadillos. When it stops or rests, it has a custom of squatting close to the ground like a hare in her form, and in this situation the great breadth of the body is remarkably apparent, being nearly three times its height.

6. The *hairy armadillo* (*D. Villosus*, Desmarest) measures fourteen inches in length from the nose to the origin of the tail, the head is nearly four inches in length, the ear two-

thirds of an inch, and the tail five inches. In form and appearance this species bears a very strong resemblance to that last described, but it is of smaller size, and is comparatively better covered with hair, a circumstance from which it derives the name by which it is most usually distinguished. The head is triangular, the muzzle pointed, the ears large, elliptical, and inclined outwards, and the number of moveable bands varies from six to seven according to the individual. The border of the bucklers, as well as the lower side of the moveable bands, is indented in a remarkable manner, and forms sharp angular points, which serve to approximate the present species to the following, not less than to distinguish it from all the other known armadillos. There are eight teeth on each side, both above and below; numerous long, flexible, brown hairs spring from every part of the body, but more especially from the sides and belly, and even cover the first half of the tail; and the female, as in the poyou, has only two pectoral mammae.

This species does not inhabit Paraguay, nor, as far as we are at present aware, any other part north of the Rio Plata, but it is found at every step on the Pampas or plains of Buenos Ayres, south of that river. 'In an expedition,' says Azara, 'which I made into the interior, between the parallels of 35° and 36° south latitude, I met with vast multitudes of this species of armadillo, so that there was scarcely an individual of the party who did not each day capture one or two at least; for, unlike the poyou, which moves abroad only during the night, this animal is to be found at all times, and upon being alarmed promptly conceals itself, if not intercepted. In March and April, when I saw them, they were so extremely fat, that their flesh surfeited and palled the appetite; notwithstanding which the pioneers and soldiers ate them roasted, and preferred them to beef and veal. The hairy armadillo,' continues M. Azara, 'like others of the genus, has undoubtedly a very acute sense of smell, since it scents the carcasses of dead horses from a great distance, and runs to devour them; but as it is unable to penetrate the hide, it burrows under the body till it finds a place which the moisture of the soil has already begun to render putrid. Here it makes an entrance with its claws, and eats its way into the interior, where it continues feasting on the putrid flesh, till nothing remains but the hide and bones, and so perfectly do these preserve their position, that it is impossible, from a mere external view to anticipate the operations which the armadillos have been carrying on within.' The same author observes further, that this species never constructs burrows to reside in, that it avoids low, damp situations, and is only found on the dry upland plains.

7. The *pichiy* (*D. Minutus*, Desmarest) measures only ten inches in length from the snout to the origin of the tail, which is itself four inches and a half long; the head is two inches and eight lines long, two inches broad across the orbits, and the ears are a quarter of an inch in length, and very sharp-pointed. The frontal buckler is composed of irregular plates, the eyes being small and nearly concealed under its margin; there are no plates on the temples, but their place seems to be supplied by a pencil of stiff brown hairs; the neck is extremely short, and furnished above with a row of minute scales; the shoulder buckler presents nothing remarkable, but that of the croup is deeply indented along the edges, and the moveable bands, to the number of six or seven, according to the age of the individual, are composed of rectangular plates, bordered on each side by compressed scales, lunated and pointing backwards. Each scale is more or less distinctly marked with two longitudinal linear depressions, which divide it into three parts, of which the middle is plain and of an oblong figure, but the lateral are, as it were, divided into six or eight tubercles. The claws are but moderately developed, the tail is covered with strong scales disposed in rings, and the interstices of the scales and bands are furnished with a considerable quantity of hair, though less abundantly and not so long as in the last species.

The *pichiy* inhabits the Pampas to the south of Buenos Ayres, and extends from 36° of latitude southward to the confines of Patagonia. It inhabits burrows, to which, however, it does not confine itself during the day, like some other species; its flesh is said to be remarkably tender and well tasted. Two individuals of this species which had been brought from Port Desire, on the east coast of Patagonia, lived for some time in the Jardin des Plantes at Paris, and would doubtless bear even the rigour of our more northern climate without injury or inconvenience.

IV. The *KABASSOUS*, or fourth division of Baron Cuvier, have likewise five toes, both on the anterior and posterior extremities, but those of the fore feet are disposed obliquely, in such a manner, that the thumb and index are small, the middle and fourth toes armed with tremendously large trenchant claws, and the fifth very small. This construction gives them the means of burrowing with extraordinary facility, and of clinging to the ground with such determination and obstinacy, that it is with the utmost difficulty they can be taken from it. They have nine or ten teeth throughout.

8. The *Tatouay* (*D. Tatouay*, Desmarest), or wounded armadillo, is so called by the Indians in allusion to its tail, which is naked, or as it were rudely deprived of the crust or bony tube which covers this organ in all the other species. The whole length of the *tatouay*, as given by Azara, is twenty-six inches and a half, from which if we subtract seven inches and a half for the length of the tail, it leaves one foot seven inches for that of the body. The tail is round, pointed and naked, with the exception of a few small round scales or crusts on the under surface of the third nearest to the extremity, which frequently trails along the ground when the animal walks; the rest is covered with soft brown fur, interspersed with a few stiff short hairs on the superior surface. The head is longer, narrower, and more attenuated than that of the poyou, though considerably less so than in the peba and mule armadillo; there are eight molars on each side of the upper, and seven on each side of the lower jaw; the ears are unusually large, being nearly two inches long, and in figure forming a segment of a circle; the body is round; the claws of the fore-feet, particularly that of the middle toe, are excessively large; and the female is provided with only two pectoral mammae. The bucklers of the croup and shoulders are composed of ten and seven rows of scales respectively, each scale forming an oblong rectangle, those of the *coccia* being the largest of all; the moveable bands are thirteen in number, composed of scales much smaller than those of the bucklers, and of a nearly square figure. The habits of this species are altogether

[The *Tatouay*. *D. Tatouay*.]

unknown. It inhabits Guyana and Brazil, and is rarely found so far south as Paraguay. Baron Cuvier, in his enumeration of the species of armadillos, inserted in the fifth volume of the *Ossemens Fossiles*, part i. p. 120, mentions an undescribed species closely allied to the present, but differing, among other characters, by the comparative shortness, and still more perfectly naked tail. We know nothing more of this animal than what is contained in this slight notice.

V. THE *PRIODONTES*, or last subdivision of the armadillos, in addition to the unequal toes and enormous claws of the *kabassous*, have from twenty-two to twenty-four small teeth throughout, on each side of the jaws, making in all from eighty-eight to ninety-six teeth—a greater number than are found in any other mammal. This group contains but a single species at present known, viz. :—

9. The *Great Armadillo* (*D. Gigas*, Cuvier), which is nearly three feet three inches in length, from the nose to the origin of the tail; the head is seven inches and a half long, the ears an inch and three-quarters, and the tail one

[Great Armadillo. *D. gigas*.]

foot five inches. Its superior size is alone sufficient to distinguish this species from all the other known armadillos, but it possesses numerous other characters not less remarkable. Its head is proportionably smaller than in the other species, the forehead is more protuberant, and the face, from the eyes downwards, assumes a tubular cylindrical form, like that of the peba: the ears are of a moderate size, pointed, and habitually couched backwards; the bucklers of the shoulders and croup are composed of nine and eighteen rows of plates respectively, and separated by moveable bands to the number of twelve or thirteen, formed of rectangular scales, about half an inch square. The tail is remarkably thick at the root, being upwards of ten inches in circumference: it is gradually attenuated towards the tip, covered with plates disposed in rings at the base, and forming spiral or crescent-shaped lines throughout the rest of its length. The claws are remarkably large and powerful, but in their relative form and dimensions differ little from those of the tatouay already described.

This species inhabits Brazil and the northern parts of Paraguay. It is never found in the open country, but keeps close to the great forests, and burrows with surprising facility. Those who are employed in collecting the Jesuits' bark frequently meet with it in the woods, and report that when any of their companions happen to die at a distance from the settlements, they are obliged to surround the body with a double row of stout planks, to prevent it from being scratched up and devoured by the great armadillo.

ARMAGH, an inland county in the north of Ireland, in the province of Ulster. It is bounded on the N. by Lough Neagh [see **NEAGH**, **LOUGH**], on the E. by the county of Down, on the S. by the county of Louth, and on the W. by the counties of Monaghan and Tyrone. The greatest length, which is from north to south, is nearly 32 English miles; the breadth, from east to west, is about 20 miles. The area is estimated, by Dr. Beaufort, at 454 square miles, or 290,786 acres; but he observes that this is very much under the full number of acres, from fractions having been rejected in the calculation; other estimates give 458 square miles, and 293,919 acres. It is subdivided into eight baronies, divisions nearly corresponding to the hundreds of English counties. The county was erected by the Lord Deputy of Ireland, Sir John Perrot, in 1584. (Ware's *Antiq. of Ireland*.)

The surface is hilly, but, except in the south and west parts of the county, which are more rugged, the hills do not rise to any great height; the soil is generally fertile, except in the mountainous district just noticed, though even there the land is cultivated to a considerable extent, and is thickly peopled. The principal mountains are Sliebh Gullen (1900 feet); Sliebh Girkin, or the Newry Mountains (1340 feet); the Fathom Mountains, lying along the Newry river (820 feet); and the Foughall or Faughall Mountains (822 feet), a little to the north-east of Jonesborough. These may all be considered as forming one group in the south-east part of the county. They are a continuation of the Mourne Mountains of the county of Down. [See **DOWN**.] Granite is their principal constituent. To the N. of this mountainous district a considerable tract extends from the county of Down on the one side, to that of Monaghan on

the other, in which greywacke and greywacke-slate are the prevalent rocks; while red sandstone predominates in that part which lies along the margin of Lough Neagh. Sienite is traced in the neighbourhood of Newry; and mica-slate composes the sides of the narrow valley between Sliebh Gullen and Sliebh Girkin. Limestone skirts the Blackwater and Callenwater. (*Trans. of Geol. Soc. vol. iii.*)

The Callen, the chief river in the county, rises in the barony of Fews, and flows N. into the Blackwater; but its course cannot be estimated at more than twenty-six or twenty-seven miles. There are some small loughs or lakes, as Lough Clay in the west, from which a small stream flows into the Callen; Lough Ross, and the loughs of St. Patrick and St. Peter, on the border towards the county of Monaghan. The river Bann with the Newry Canal forms the eastern boundary of the county, separating it from that of Down, and affording water-carriage from Lough Neagh to the Bay of Carlingford; the Blackwater on the N.W. separates it from the county of Tyrone.

In 1788 the medium temperature in the neighbourhood of the city of Armagh, distant about thirty-two English miles from the Irish Sea, and elevated about fifty-eight feet above the coast, was ascertained (by means of a well sunk sixty feet to the bottom of a gravelly hill) to be 47.5° of Fahrenheit. (*Trans. of Royal Irish Acad. 1788.*) But we are informed that it is 49° 5 at the observatory.

In the neighbourhood of the chief town, numerous inclosures and cultivated fields indicate an abundant population, and in this vicinity there are a few orchards. In the northern part of the county, towards Lough Neagh, there are very extensive bogs, the soil of which is very black and deep: but the increase of population has led to the cultivation of some parts of these, as well as of the greatest part of the mountainous districts. The principal landed proprietors are Lords Charlemont, Gosford, and Caledon; Mr. Brownlow, Mr. Cope, and others. A large portion of the soil belongs to the church and to college establishments and corporations, which have not the power of granting freehold leases for lives; the common tenure on other properties is a lease for twenty-one years and one life. To such an extent has subletting been carried, that the country has been described as resembling in some parts a disjointed village, and general poverty has been the usual result. If a father had a family the land was divided among his sons, and part of it went frequently as a portion to the daughters. The linen trade, carried on as it is by the individual weaver, is considered to have promoted this division of land. There seems, however, to be a disposition at present to check this system, and to consolidate the small holdings into larger farms.

In the hands of such occupiers we cannot expect superior husbandry. The description given of the state of tillage in the flat parts of the county of Antrim [see **ANTRIM**] will, in a great degree, apply to the neighbouring county of Armagh. The rotation of crops, if so irregular a succession deserves that name, is similar in each; the joint contribution of animals to form a team for the plough, and the 'con-acres' of the dry cotter, as described in the account of Antrim, are found in this county also. The joint team for the plough is indeed rather more respectable, consisting usually of two horses, one belonging to the driver, the other to him who holds the plough. Oats are the chief kind of grain raised. Wheat and barley are not so extensively grown. The cultivation of wheat, which was introduced into Ulster at a comparatively recent epoch, has increased materially; and Belfast, the great outlet of its produce, now exports corn of excellent quality to England: the consumption of wheaten bread among the peasantry is also much greater than formerly. Potatoes and flax are also among the chief articles of agricultural produce; but the potatoes are very inferior in quality to those grown in the south of Ireland.

Grazing is little attended to in any part of the north of Ireland. The little farmers or cotters keep cows, but they are badly managed and hardly treated: patches of the artificial grasses are sown; and part of the grass (which, in Ulster, is commonly confined to the banks of rivers) also serves the cows for food, but the want of fodder in winter materially diminishes the quantity of milk. Few beasts are fattened, the crowded population leaving little land for pasture. There are no extensive dairy farms; but as the little farmers keep cows, a considerable quantity of butter is sold for exportation. The breed of cattle is small and stunted. Sheep are not much attended to, and their wool is not produced in greater quantity than the domestic

purposes of the grower require. The horses are inferior in size and appearance: the linen merchants, who travel about to different markets, use a small, hardy, and sure-footed native breed of hacks. Goats and pigs are reared, the latter in great numbers.

Although agriculture has been improving since the time of Mr. Wakefield's publication (to which we are indebted for many of the foregoing particulars), yet it is still very inferior to that of England. The fields are ill-inclosed and ill-drained, and not kept clear of weeds; the farming in many cases is slovenly, though there are instances to the contrary.

Linen is the staple manufacture, and the county has consequently been affected by the decline of that business. The mode of manufacture by small farmers has been already described. [See *ANTRIM*.] It does not appear that the cotton manufacture has gained any footing; but a mixed fabric of cotton and flax, called 'Unions,' has been partially substituted for that of linen. The demand for linen is not so active as it has been, and yet all that the weavers bring to market is sold. The introduction into England and Scotland of machinery for spinning flax has been felt in Ireland, where it has reduced the wages of spinners, which were always low. They cannot now earn more than eighteen pence per week. Spinning machinery has been introduced to a certain extent into this county.

The condition of the weavers has been materially affected by these causes. At one time they could earn 2s. per day, and, by working extra hours, 2s. 6d.; now their earnings do not average more than 1s. a day (which is about the pay of a field labourer), but it does not appear that there are many of them out of employ. The depression of the linen trade has led some to go to Manchester and the neighbourhood: others give more time to their little farms; and the introduction of steam communication with England has given them a new and better market for their produce. The condition therefore of the peasantry has rather improved than otherwise. Their food, except the increased consumption of wheaten bread, still consists of potatoes, milk, bread, and butter, and occasionally pork. The clothing of the females is better than it used to be, though they still go without shoes or stockings. The habitations of the peasantry are also improved.

The moral character of the females is correct; and the peasants show a disposition to provide for the wants of their aged parents. Mendicants here, as in Ireland generally, are numerous, and, as a body, very immoral.

The mineral productions of this county are inconsiderable. Marble is quarried near Armagh; and at Keady, about eight miles from that city, a lead mine was once worked. The chief roads are those from Dublin to the city of Armagh, one through Newry, and the other through Castle Blaney; the continuation of these to Coleraine; and the roads from Armagh to Belfast, Monaghan, and Londonderry.

The population in 1821 was 197,427, and in 1831 220,651. It was estimated by Dr. Beaufort, in 1790, at 120,000. The only towns of any importance are Armagh (population 9,189), and Lurgan (population 2,842). [See *LURGAN*.] The others are all small, as the following list, with their population in 1831 will show:—Tanderagee, 1559; Rich-hill, 937; Newtown Hamilton, 1050; Keady, 896; Charlemont, 517; Market-hill, 1043; Blackwater, 528; Loughgall, 325; and Portadown, 1591. Part of the more important town of Newry (population 13,134) is in Armagh; the greater part is in the county of Down. [See *NEWRY*.] It appears that though the population of the county is dense, it is not much collected in towns and villages. The number of pupils at schools in the county in 1821, was 12,407, viz., 8,529 boys, 3,878 girls; in 1824 it was about 13,700, viz., about 7900 boys, 5,200 girls; of about 600 the sex was not stated.

Three members are returned to the imperial parliament from this county: two for the county itself, and one for the city of Armagh. Newry returns a member.

It is difficult, from the variation of authorities, to state the number of parishes in the county. In the population return for 1821, twenty-three parishes, as used for civil purposes, are given as wholly or partly in this county; but these, from the consolidation of parishes into unions and the erection of perpetual curacies, must not be regarded as coincident with the existing ecclesiastical divisions.

It is not very easy to ascertain the state of religious

parties in the county. In 1812 Mr. Wakefield estimated the proportion of Catholics to Protestants as three to one, the Catholics occupying all the mountainous parts, and being mixed with Protestants in the more level. He observes that the influence of the priests was small; and the bigotry of their flocks not so great as in the south of Ireland. In the year 1824, according to the reports of the commissioners of education in Ireland, the proportion of Catholic scholars to those of Protestants of all classes, was 53 to 81 by the returns of the Protestant clergy, or 52 to 78 by those of the Catholic clergy: but the different rank in life of the Catholics and Protestants renders this an unfit criterion of the relative population. The proportion of the pupils of the Established Church to Presbyterians was at the same time about 47 to 29, according to the returns of the Protestant clergy, or 44 to 30, according to those of the Catholics. This, as the parties are on a more equal footing in their rank in society, affords a better criterion; but Mr. Wakefield, in 1812, thought that of the Protestants in this county (county?) a very small proportion belonged to the Established Church. But we have reason to believe that in this opinion Mr. Wakefield was mistaken.

Among the antiquities of the county may be mentioned the cairn on the top of Sliebh Gullen, said to form the roof of a cavern of artificial construction; and that called the vicar's cairn, about five miles south-east of the city of Armagh, on a lofty hill, which is thought to be excavated. (*Mém. R. I. A.* vol. viii.: Wakefield's *Account of Ireland*, 1812; Dr. Beaufort's *Memoir of a Map of Ireland*, 1792; *Parliamentary Papers*.)

ARMAGH, a city of Ireland, in the barony and county to which it gives name, 81 miles from Dublin. It is in the northern part of the county, and not far from the little river Callen, a feeder of the Blackwater, which flows into Lough Neagh.

The town is on an eminence, with the cathedral in the centre crowning the summit, and is surrounded by other small eminences. Some of the streets form an irregular circuit round the cathedral, and on the slope of the hill; all the others, leading into the town from the surrounding country, terminate in this circuit, except three, which are continued to the summit, and lead to the cathedral enclosure. Armagh which had sunk greatly to decay, owes much of its renovation to the munificence and public spirit of Dr. Richard Robinson, Baron Rokeby, who was archbishop from 1763 to 1794. The town is rather more than three-quarters of a mile from north to south, and above half a mile from east to west.

Of public edifices the cathedral deserves the first notice, although in richness and beauty of architecture it is inferior to many of our English cathedrals. Its situation is commanding, from being on the summit of the hill on which the city is built. After undergoing many changes from the period when St. Patrick is said to have founded it (viz. in 445), it was destroyed in 1566 by Shane O'Neil, who wished to revenge some insult which he thought had been offered him by the primate (Loftus). It was rebuilt in 1616 by primate Hampton, and in 1642 it was again destroyed by Sir Phelim O'Neil during the primacy of the celebrated Usher. It was again rebuilt by primate Margetson in the year 1675, and repaired and improved by primate Robinson; and a complete restoration is at present going on. It is in the form of a cross 183½ feet long from east to west; and in breadth across the transepts 119 feet in the clear. From the intersection arises a square tower (the battlement of which is 31 feet above the roof) surmounted by a spire 40 feet high. From the ground to the top of the weathercock is 150 feet.

Part of the tower and the spire were built during the primacy of Robinson. The same prelate built near the town a handsome archiepiscopal palace, of large dimensions, and in a light and pleasing style of architecture. It is in the midst of a lawn skirted by plantations; the offices are detached and hidden behind a plantation at a small distance. He also contributed largely to the erection of a new school-house in the town, containing large dormitories, dining-room, and school-room, apartments for the master, and a spacious walled play-ground. This school, an exceedingly well-endowed royal foundation of Charles I., long maintained, under Mr. Carpendale, the master whom primate Robinson appointed, a high reputation, and was regarded as the Westminster or Eton of Ireland. A public library and an observatory were built and endowed by the same

primate, who also directed the erection of barracks, procured the establishment of a county infirmary, and ornamented the city with a new market-house and shambles. By refusing to grant leases except on the condition of the tenants rebuilding the houses, he raised the place from an almost deserted village, a nest of mud cabins, to be one of the most beautiful and flourishing inland towns in Ireland*.

Armagh is the assize town of the county, and has a jail, as well as a handsome court-house, lately built. It is lighted with oil, but as gas works are being erected, it is expected that it will soon be lighted with gas. The footways are neatly and durably flagged, the streets are clean, and the care of the magistrates keeps away beggars. The magistrates of the place are a 'sovereign,' and a 'registrar.' There are several excellent walks about the town. Water is supplied from a pool or reservoir called Lowry's Lough, on an eminence east of the city. Main and lateral pipes run through every street; but the water is not very good, owing to the preparation of flax in the surrounding district.

The chief trade is in linen, which is made in the country around, and brought into the town on the market-day (Tuesday), and sold by the weavers to the drapers for bleaching. There are five fairs in the year. It is probable that the general depression of the linen trade has affected the prosperity of this place. The population of the town, in 1821, was 8,493, and in 1831, 9,189; but the whole parish contains about three times that number. Armagh sends one member to parliament. Before the Reform Bill, the franchise was in the hands of twelve burghesses, self-elected, who returned the primate's nominee.

The see of Armagh is said to have been founded by St. Patrick in the fifth century, and was made an archbishopric in 1152. The archbishop bears the title of 'Lord Primate and Metropolitan of all Ireland.' The diocese was once divided into two parts, the English, now the upper, and the Irish, now the lower part. It extends into five counties—Armagh, Londonderry, Louth, Neath, and Tyrone. The archbishop's province includes the sees of Dromore, Down and Connor, (united), Derry, Raphoe, Clogher, Kilmore, Ardagh, and Meath: the province of Tuam is to be incorporated with it whenever that see becomes vacant. The chapter consists of a dean, precentor, chancellor, treasurer, archdeacon, and four prebendaries, with eight vicars choral. The see is valued in the king's books at 183*l.* 17*s.* 1*d.*, and by the board of first-fruits at 400*l.* The primate's income was estimated by Mr. Arthur Young, in 1779, at 8000*l.* per annum, and by Mr. Wakefield (1812) at 12,000*l.*: it was really 15,000*l.*, but is diminished by the Church Temporalities Act. He presents to sixty parishes in his own diocese, and to six parishes in other dioceses.

The number of benefices in the diocese has varied considerably, from the formation of unions and the erection of perpetual curacies. By the report of the commissioners of ecclesiastical inquiry in Ireland (dated April, 1831), it appears that there were then eighty-three benefices, sixty-eight consisting of single parishes or separate portions of parishes, and fifteen consisting of parishes or portions of parishes united. The diocese of Clogher, when vacant, is to be incorporated with that of Armagh.

Armagh is a rectory, being, with several other parishes, comprehended in a parochial union, in which six curacies (four of them perpetual) have been instituted. The living has been for a long time held by the dean of the cathedral. The cathedral is the parish church; and there is another place of worship belonging to the establishment. There are also a Roman Catholic chapel and a Presbyterian meeting-house, both on a large scale; a place of worship for the Seceders; another for the Independents, and two Methodist meeting-houses. There are several churches in the out-parts of the parish. One of them, at Grange, owes its erection to the munificence of primate Robinson. It is of white stone, and its tall spire makes it a handsome object. Besides the county infirmary above-mentioned, there is a lunatic asylum for 106 patients of the counties of Monaghan, Cavan, Fermanagh, and Armagh. A fever-hospital has been built, and is maintained at the expense of the present lord primate; a 'shop for the poor' has been instituted by some individuals of his family; and a mendicity sub-

scription afforded relief in the year 1830 to 500 persons, to the amount of nearly 584*l.*

Besides the royal foundation school there are several establishments for education, as, a chartered school for 20 girls, founded by Dr. Drelincourt; a school for fifty girls, supported by Lady Lifford, and two for eighty boys and as many girls, by the primate; and a Sunday school for 160 boys. The whole number of children under instruction in the city, in 1821, was 1071 (934 boys and 137 girls), and in the whole parish 2319, viz., 1899 boys and 420 girls.

Armagh formerly contained many monastic establishments. The priory of the regular canons of St. Augustin was said to have been founded by St. Patrick, and was, for some years, one of the most celebrated religious establishments in the world. There were a priory of the Culdees (*Culdei* or *Colider*), who were secular priests, and served in the choir of the cathedral, their prior being a precentor there; a friary of Dominicans, and one of Franciscans.

In the early periods of its history the town was subject to many severe visitations. Conflagrations happened in the years 670, 687, and 778. In 832 the Danes plundered it; and in 839 they burned it to the ground with all its sacred edifices. On six other occasions in the same century it was laid waste by these barbarians. The annals of the three following centuries abound with notices of plunderings or fires. During that period Armagh was plundered thirteen times; it has been burnt (partly or wholly) seventeen times. Probably no other town ever suffered such a succession of misfortunes. (Young's *Tour*; Wakefield's *Account of Ireland*; *Liber Hiberniæ*; *Parliamentary Papers*, &c.)

The position of the observatory of Armagh is 54° 21' 12" N. lat. 6° 38' 52" W. long.

ARMAGH OBSERVATORY. [See OBSERVATORY.]

ARMAGNAC, a county in the province of Gascogne (Gascony), chiefly comprehended in the present limits of the department of Gers. While the old divisions of France continued in use, it had Languedoc on the east, the Agenois and Condomois on the north, Gascogne Proper on the west, and Bearn, Bigorre, and Comminges on the south. All these, except Languedoc and Bearn, are subdivisions of Gascogne. Few maps that we have seen give this county in all its extent, as described by Pignaniol de la Force. (*Nouvelle Descript. de la France*, 2d edit. 1722.) It extended on the east to the Garonne; and on the south, some of the districts included in it (as les Quatre Vallées) stretched into the very heart of the Pyrenees. It comprehended the districts of High or White Armagnac, Low or Black Armagnac, Astarac, Brulhois, L'Eauzan, Fezenzac, Gaure, Fesenzaguet, Lomagne, Les Baronies, Riviere-Verdun, Riviere-Basse, les Quatre Vallées (de Magnoac, de Neste, d'Aure, and de Barousse), already noticed, and Nebouzan. The chief towns were Auch (population, in 1826, 11,000), Lectoure (population 6000), Vic-Fezenzac (population 4000), L'Isle Jourdain (population 4000), Mirande (population 2000), Nogaro, Fleurence (population 3000), Leyrac Vic, or Lavit, Castelnau de Magnoac, La Barthe, Mauléon, Arreu, or Arreau, and Sarrancolin. These, which, with the exception of Leyrac and Mauléon, may be traced in the departments of Gers and Hautes Pyrenées, in the map of France published by the Society for the Diffusion of Useful Knowledge, will give some idea of the extent and ramifications of the province of Armagnac*. [For an account of such of these places as require further notice, see AUCH, LECTOURE, MIRANDE, GERS, and HAUTES PYRENEES.]

The county of Armagnac arose in the tenth century by the division of the lands of the Count of Fezenzac, whose younger son Bernard received that part of the county of Fezenzac which adjoins Bigorre, and thus became the first Count of Armagnac. The failure of the elder branch of the family of Fezenzac (which had retained that title) brought the territory under the sway of the younger or Armagnac branch in the early part of the twelfth century. The domains of these nobles were extended by subsequent acquisitions, especially under Bernard, Count of Armagnac, constable of France under Charles VI. in the fifteenth century, a man of great ambition, haughtiness, and cruelty, who gave name to one of the factions which then divided that unhappy country. John, the last Count of Armagnac, having incurred general odium by his crimes, and rendered himself obnoxious to Louis XI. of France by his political conduct, caused the

* Primate Robinson died at Clifton near Bristol, in October, 1794, but his body was brought over to Armagh and interred in a vault under the cathedral. A bust of him, by Bacon, adorns that edifice, which contains also a whole-length figure of the late Primate Stuart by Chantrey, one of Dean Drelincourt by Kyrbrach, and some other pieces of sculpture by Irish artists.

* It may be noticed here that the district marked 'Armagnac' in the Society's map of France in Provinces, is not so extensive as that above described, even though the small nameless divisions in that map lying to the S. and E., which properly belong to Armagnac, be included in it.

downfall of this antient and powerful family. Besieged in 1472-3 in Lectoure, of which he had got possession, he was himself killed and the town taken by the perfidy of his enemies. The county was confiscated; and though it was subsequently re-established by Francis I., it reverted to the crown by inheritance on the accession of Henry IV. It was again re-established in 1645, during the minority of Lewis XIV. in favour of Henry of Lorraine, Count of Harcourt, and his heirs male.

Armagnac was commonly divided into High and Low:—High Armagnac comprehended only the district so called, in which are the towns of Auch and Lectoure; and Low Armagnac included all the other districts given above. It is very fertile in grain and wine. Its brandy is of good quality, but not equal to that of Cognac. Very fine Bon-Chretien pears are also produced. (Piganiol de la Force, *Descr. de la France*; Martinière, *Le Grand Dictionnaire*; Baubi.)

ARMAGNAC, COUNTS OF, were descended from the antient dukes of Aquitaine and Gascony, and took their title from the county of Armagnac. John I. increased the importance of his family by marrying a daughter of the House of Bourbon. He was one of the powerful chiefs, in the south-west of France, strongly opposed to the claims of the English, and for this reason highly trusted by the French king, by whom he was made governor of Languedoc. Although we find him accompanying the Black Prince in his Spanish expedition against Peter the Cruel, he was still the prince's enemy when France and England renewed the contest. He died in 1373. His grandson, John III., who married the heiress of the House of Comminges, led an army of adventurers into Italy, where he laid siege to Alessandria, and fell under its walls in 1391. Bernard, younger brother of John III., succeeded him: he became the most celebrated of his family, and gave his name to the great party which he headed in opposition to the Burgundians. His aunt married the Duke of Berry, one of the French princes; and Bernard, in 1410, gave his daughter in marriage to the Duke of Orleans, then too young to head his party, and the task consequently fell to the Count of Armagnac. This distinction enabled him to rally under his banner the warlike and needy population of Gascony, whom he led, in the year 1410, to attack Paris. The cruelty with which these rude bands treated the court and the people round the capital inspired them with horror for the cause of Orleans, and contributed in no small degree to give that character of atrocity to the civil wars of the time in which they stand unequalled. The Armagnacs were composed of a rustic or pastoral population: the Burgundian cause was chiefly supported by the burgesses of the north of France and Flanders; and thus the mutual hatred of citizen and peasant increased the animosity between the opposite parties.

In 1412 both Armagnacs and Burgundians courted the alliance of England. The former made the higher offers, and stipulated to restore Aquitaine to Henry IV. of England, in return for his support. The discovery of the articles of this treaty, which were found upon one of the emissaries, did more to weaken the party of the Armagnacs in France, than even their cruelty or their want of success. In the following year, however, the excesses of the Burgundians having disgusted the Parisians, the Armagnacs obtained for the first time the superiority in the capital, and indeed throughout the kingdom.

The accession of Henry V. to the throne of England, his alliance with Burgundy, his invasion of France, and the victory at Agincourt, changed the face of affairs. The Count d'Armagnac, who had not been present at the battle, but who hurried from the south with a small army to defend the capital, was now the sole reliance of the dauphin. He was accordingly created Constable in the last days of 1415, and he soon showed himself an active and severe leader. Towards the citizens, especially of Paris, he showed himself a merciless tyrant, levying contributions, disarming them, forbidding them to meet in any numbers, however small, and punishing the least murmur by the sword of the executioner. In the field he was not so successful. The Earl of Dorset, with very inferior forces, put an army of Armagnacs to disgraceful flight; and the Count, in his rage, had no other satisfaction but that of hanging some of his own runaway soldiers. His cruelties and his defeat weakened his party, which he still however supported by terror. His harshness made an enemy of the queen, who meditated on making use of the authority of the dauphin to shake off the

Armagnac yoke. The dauphin, John, son of Charles VI., soon expired, it was said by poison; and at the same time the death of other foes or rivals showed either the good fortune or the treachery of the Count d'Armagnac.

Queen Isabel, whom the Count of Armagnac had confined at Tours, was not, however, without her revenge. She communicated to the Duke of Burgundy her wish to escape from the bondage in which she was held; and an expedition undertaken by that prince rescued Isabel from the hands of the Count. The Burgundians soon drove the soldiers of Armagnac from the open country, and compelled the Count to concentrate his force in Paris; but the universal hatred borne to him rendered all his efforts at resistance vain. One of the gates was betrayed in the night to the enemy, and the Burgundians got possession of Paris, but not without a struggle. At first the persons of the Count and the chief members of the Armagnac party were respected, but after a few days the populace, being exasperated by past struggles, and excited by recollection of the tyranny of the Armagnacs, burst open the prisons, and massacred all within. This took place on the 12th of June, 1418. A white scarf, worn obliquely over the person, was the badge of the Armagnacs. The populace cut a stripe of flesh, in form of this scarf, from the body of the murdered Count. More than 3000 persons are said to have perished in this revolution.

John, Count of Armagnac, grandson of the preceding count, though less powerful as a party chief, was equally notorious for his crimes and his turbulence. An incestuous intercourse with his sister, which he avowed, and sought to cover by a marriage, first drew upon him the indignation of the pope Pius II., and of his sovereign, Charles VII. He was excommunicated, and forced by the royal troops to take refuge in exile. A prosecution was commenced against him before the parliament of Paris: he first appeared to answer the charges, but upon his again taking to flight, he was condemned, and his domains confiscated. The count, by repairing to Rome, contrived to soften the pope's anger, and procured the reversal of his sentence of excommunication. Under Louis XI., in 1461, the Count of Armagnac obtained possession of his fiefs, but soon joined in the revolt against that prince, which the Burgundians abetted. Louis XI. purchased the cessation of his enmity at the price of 10,000 crowns,—a sum bestowed in vain. For several years, Armagnac seemed an enemy in every sense worthy of Louis XI.,—revolting, defending himself bravely, when overcome at last vowing submission once more, and again acting the traitor. In his character and career he resembles the late Ali Pacha of Janina, and he met with a similar fate. Cardinal d'Albi, who was sent against him by the king, entered into negotiations with him, concluded terms of peace, and even a consecrated wafer was broken and taken by both parties in sign of good faith. Relying on this, Armagnac relaxed in the vigilance of his guard; and the soldiers of the cardinal found means to introduce themselves into the fortress of Lectoure, and to massacre the count and his followers in 1473. The king's commands required the total extermination of the Armagnac race. Jeanne de Foix, the legitimate wife of the count, who was pregnant, was compelled to swallow a draught of poison. His brother Charles was seized, tortured, thrust into an unwholesome dungeon, but survived, and was liberated after the death of Louis XI.

A descendant of the family was created cardinal under Francis I.; he was known as an upright administrator and a patron of letters. He died in 1585, at a very advanced age. [See NEMOURS.]

ARMATOLI, a sort of national militia among the Greeks, instituted, according to some, during the Byzantine empire, but others refer it to a period subsequent to the conquest of Greece by the Turks. They were originally the mountaineers of northern Greece. The sultans, finding great difficulty in reducing them to submission, were constrained to come to terms of pacification with them, and, on the payment of a trifling tribute, they were allowed to retain their arms, and to form themselves into a military community, occupying their native districts, and governed by their own laws. They were charged with the suppression of brigandage in the mountain passes. The chiefs were styled Capitani, Polemarchs, or Protatos; the jurisdiction of a chief was called an armatolic, and he resided generally in the principal village of his canton. The office was hereditary, descending to the eldest son, who obtained a diploma

from the pacha of his district, to whose authority he submitted. The band was composed of and commanded by Greeks exclusively; and, according to Faurel, the number of cantons, immediately prior to the revolution, amounted to seventeen. The members who, in point of number, are unrestricted, were called *palikari*: their costume was that generally known as the Albanian; their arms consisted of a yataghan, sabre, musket, and pistols; they were brave and temperate, and inured to hardship and fatigue.

About the middle of the last century, however, the Porte thought fit to appoint a *Dervenji Bashi*, in whose hands the care of all the passes was placed: this was a measure designed for the subversion of the *armatoli*. Ali, pacha of Joannina, having been also appointed *Dervenji Bashi*, made strenuous efforts to destroy their independence; but his cruelties drove the greater part to rebellion, and they fled to their native fastnesses. Here, as in the Morea, they maintained a sort of turbulent independence, and, at the first cry of the revolution, issued forth to assist in the liberation of their country. (Emerson's *Modern Greece*; See Leake's *Morea*, ii. 106.)

ARME'NIA. The extent of country designated by the name Armenia is not defined by any permanent natural boundaries. In the course of its history we find its limits exposed to constant changes.

When taken in the widest sense of the expression, Armenia may be said to embrace the country from lake Urmia and the junction of the rivers Kur and Araxes in the east, to the upper course of the Kizil Irmak or Halys in the west; and from the upper course of the rivers Chorok and Kur in the north, to the Taurus mountains in the direction of Bir, Mardin, and Nisibis, in the south. This extent is given to Armenia in the outline of a map prefixed to *Avdall's translation of Michael Chamich's History of Armenia*. (Calcutta, 1827, 2 vols. 8vo.)

The Armenia of Herodotus (v. 52) bordered on the west on Cilicia, from which country it was separated by the Euphrates; towards the N. it included the sources of the Euphrates (i. 180); towards the S. and E. its limits are not distinctly defined; probably Mount Masius separated it from Mesopotamia, and Mount Ararat from the country of the Saspis, who occupied the valley traversed by the Araxes. (See Rennell's *Geograph. Syst. of Herodotus*, vol. i. p. 369, 2d edit.)

The Armenia of Strabo (xi. 14) is limited on the S. by Mesopotamia and the Taurus; on the E. by Great Media and Atropatene; on the N. by the Iberes and Albani, and by the Parachoathras and Caucasus mountains; on the W. by the Tibareni, the Paryadres and Skydis mountains, as far as the Lesser Armenia, and to the country on the Euphrates which separates Armenia from Cappadocia and Commagene.

Abulfeda and other oriental geographers not only extend the limits of Armenia considerably to the N., so as to include Tiflis and part of Georgia, but also comprehend Cilicia and part of Cappadocia under the appellation of *Belad-al-Armen*. (See the geographical index to Alb. Schultens' *Vita Saladini*, Lugd. Batav. 1755, fol., and the *Geographical Works of Sadik Isfahani*, edited by Sir William Ouseley, London, 1832, 8vo. p. 6.)

The greater part of Armenia constitutes an elevated tableland, intersected in all directions by rapid streams, and with numerous ranges of higher mountains rising above it. Armenia, in fact, belongs to the great plateau of Iran; its southern boundary, which rises like a wall above the lower level of Mesopotamia, is the Kurdistan range, which passes in a W.N.W. direction a little to the N. of Mosul, is cut by the deep bed of the Tigris at Jezirah, passes a little N. of Nisibin, and past Mardin to the point where the Euphrates traverses the great range of the Taurus.

Near the town of Erzerum we find a chain of mountains which, by several projecting branches, is connected with the Caucasus, and separates the valley of the Chorok and its tributary streams in the west from that of the Kur and Araxes in the east, while the upper course of the northern branch of the Euphrates, often called the North Frat, marks its southern declivity. Its parts bear different names: among the Turks they are known by the appellations of Elkezi, Cheldir, Bin-Gheul (i.e., the thousand lakes), &c., and among the Armenians by the names of Khakhdkh, Barkhar, Garin, &c. These mountains partly correspond to the situation of the Paryadres, Skydis, and Montes Moschici, of the antients. The Bin-Gheul, or Pinkiol, gives origin to

the Araxes and to the northern branch of the Euphrates [see ARAS]; on the Barkhar the river Kur has its source.

The chain of hills which separates Armenia from Georgia, commencing near Akhalzikh (41° 37' N. lat.), and accompanying in a south-easterly direction the course of the river Kur, is by the Georgians named Klardjethi or Taosi, by the Armenians, *Medin* (i.e. The Dark), or *Sdorin-Govgas* (i.e. The Low Caucasus).

South of the Araxes we meet with a range of mountains, called by Colonel Monteith the *Mosian* (Masian?) hills, some of which are covered with eternal snow, extending from the banks of the Araxes opposite Erivan westward to the Euphrates. They are in Turkish called *Kus-dagh*, *Kiziljeh-dagh*, *Aghir-dagh*, or *Ala-dagh*; in Armenian, *Dagher-dagh* and *Masis*. They must not, in consequence of the last name, be confounded with the *Montes Masii* of the Greek and Roman geographers, which are farther south. At the eastern extremity of this chain, and washed by the Araxes, is situated an elevated mountain, the *Abus* of Ptolemy (Mannert, v. iii. p. 140), called by the Turks *Agri-dagh*, and by the Persians *Koh-i-Nuh* (i.e. Mount Noah), and believed by the natives to be the *Ararat* of Scripture. Parrot, the first European traveller who ascended this mountain, found its height to be 16,200 Paris or about 17,260 English feet. According to another popular tradition in the country, the *Ararat* of Scripture is the present Mount Judi, S.W. of the Lake Van, in the Gordyean mountains. At a distance of about forty miles from Mount Ararat, on the northern side of the Araxes, there is another high peak, Mount Ali Guz, the height of which Colonel Monteith states to be 15,000 feet. [See ARARAT.]

S.W. of the Masis is Mount Nebad or Nebadagan, according to Saint-Martin the Niphates of the antients. Towards the south of the Nebad are situated the *Dzaghe* hills, in which the *Murad-chai* has its source.

South of the Murad, and forming the separation between Armenia and Mesopotamia, are the Kurdistan Mountains, already described as part of the southern boundary of the high land, or, as these parts of it were antiently called, the *Masius* and *Carduchian* mountains. The Armenians themselves have no general appellation for this line of mountains, which constitutes the southern frontier of their country.

East of the Tigris, and immediately south of the lake Van, we find the *Kareh*, *Judi*, and *Amadiah* mountains (the *Montes Gordyæi* of the antients), and towards the frontiers of Persia the *Kara-dagh*. (See Saint-Martin, *Mémoires sur l'Arménie*, vol. i. p. 36-54.)

These chains of mountains and their accumulations of snow contain the sources of innumerable streams. The Tigris has its origin in the Niphates, but its sources have not yet been determined with precision. Herodotus (v. 52) speaks of three rivers, each bearing the name of Tigris; the two western streams coming from the country of the Armenians, the third, farther to the east, from the *Matieni*. This is supposed by Mannert to refer to the three upper branches of the Tigris, viz. that of *Diabekir*, that of *Meiafarekin*, and that of *Erzen*. But there are some objections to this opinion, as it includes the *Great Zab*, and other streams, which must have been crossed on the road to *Susa*. Pliny makes the remark (*Hist. Nat.* vi. c. 31) that the Tigris is called by this name only when it flows rapidly, and that as far as its course is slow it is named *Diglit*; according to Josephus (*Antiq. Jud.* i. 2), the entire river was called *Diglat*: this name survives almost unchanged in the present *Dijlat*. What Pliny relates of the Tigris passing through the lakes *Arethusa* and *Thospitis* seems applicable to the branch which passes by *Erzen*, for the lake *Thospitis* of Pliny is probably the same as the *Thonitis* or *Arsene* of Strabo (xi. 14, t. ii. p. 461, ed. Tauchn.). The river *Ken trites*, mentioned by Xenophon (*Anab.* iv. c. iii. 1) as forming the frontier between Armenia and the country of the *Karduchi* (or *Gordyæi*), is supposed by Mannert to be the *Nikephorios* of later writers, now called *Khabur* or *Sered* (our river of *Bedlis*), which has its source in the mountains south of the lake Van.

The Euphrates, and its first great auxiliary stream, the *Murad-chai*, also designated as the southern branch of the Euphrates, have their sources in the very heart of Armenia. The northern Euphrates arises in the *Bin-Gheul* hills in the district of *Garin* near *Erzerum*. In the name *Garin* it is easy to recognize that of *Caranitis*, where Pliny (v. 24) says that the Euphrates has its origin. According to

Pliny, this river bears at first the name of Pyxirates, and farther on that of Omirras, and is called Euphrates only after entering the plains of Syria and Mesopotamia. The Murad-chai flows in a western direction as long as it remains within the limits of Armenia. It is probably the river called Euphrates by Xenophon (*Anabasis*, iv. c. v. 2), who says that the ten thousand Greeks in their retreat forded it, the water only reaching up to the navel; the sources of the river they understood to be at no great distance, but in this they were somewhat misinformed, if they crossed it, as we suppose, on the W. side of Lake Wan. The river Teleboas, over which the Greeks had passed before they came to the Euphrates (*Anab.* iv. c. iv. 3), has not yet been well determined. The Murad-chai joins the Euphrates near Kebban, 38° 40' N. lat. Below that place, and in its passage through the Taurus mountains, the course of the Euphrates is interrupted by rapids which obstruct the navigation to and from Syria.

The Cyrus or Kur is the principal river of Armenia. It has one of its sources in the hills north of Kars, and another in the Lake Pharhavan near Akhal-kalak. They meet at Pikelek. The Kur then passes by the forts of Khertwis and Aspindza, and farther down by the towns of Gori and Tiflis. Near Jebat or Jevat the Araxes joins the Kur, and the two rivers pour their united waters through three mouths into the Caspian Sea. Of the Araxes or Aras, which has its source at Dekman in the Bin-Gheul hills near Erzerum, some account has already been given in a separate article. [See ARAS.]

The Chorok has its source in the hills west of Baberd. In its upper course it is called Masatteresi, and farther down takes the name of Chorokh. It passes the towns of Baberd, Sper, Khotjur, Berdagrac, and Ardivin, and after having during the greater part of its course followed a north-eastern direction turns westward, and falls into the Black Sea between Batum and Kunia or Gonia. (See the *Nouveau Journal Asiatique*, vol. xii. p. 458-470.)

Among the lakes of Armenia, that of Wan is the most important. It lies in a basin surrounded by lofty hills on the S., W., and N., and is separated from the lake of Urmia to the E. by a chain of hills. Its elevation is no doubt several thousand feet, but we are not aware of any measurements being made. Ptolemy mentions it under the name of Lake Arsissa: this name still survives in the fortress of Arjis situated on the northern side of the lake, which is noticed as one of the principal towns of Armenia by oriental geographers. (See Abulfeda, in the Index to Schultens' *Vita Saladini*; Ouseley's *Sadik Isfahani*, pp. 6 and 62.) The circumference of the lake is estimated at 240 miles. It contains two considerable islands, on which have been built Armenian convents. Fourteen vessels are constantly employed in conveying goods from the different towns on its banks. Eight rivers fall into the lake, but none of them are of great importance. Jaubert (*Voyage en Arménie et en Perse*, p. 127) describes the scenery of the surrounding hills as extremely picturesque. (See Col. Monteith, in the *Journal of the Royal Geographical Society*, vol. iii. p. 50.)

Towards the north-east of Erivan is the lake of Goukeka or Sevan, also named Kiagar Kuni. From it springs the river Zengay or Zenghi, which passes by Erivan and then falls into the Araxes.

In the Masis or Mosian hills, west of Mount Ararat, and at a distance of twenty-seven miles towards the south from Kara-kulla on the Araxes, Col. Monteith visited a lake of twenty-four miles in circumference, at the extraordinary elevation of 6000 feet. At its western extremity a stream came from it, passing Bayazid and Maku, and then falling into the Araxes.

The climate of Armenia, notwithstanding its southern position, is, in the higher regions, extremely cold. The summits of several of its mountains are covered with eternal snow. The German traveller, Schulz, who visited Armenia in 1827, found the hills between Trebizonde and Erzerum, especially the Ghulat and the Karakapas, covered with deep snow in the month of June; and Tournefort found the wells near Erzerum thinly frozen over during the night in July. On the southern boundary of Armenia, and on the road from Diarbekir to Bedlis up the valley of the river of Bedlis, Father Avril found the tops of the hills covered with snow in April. (Avril, *Voyage en divers états d'Europe et d'Asie*, Paris, 1692, 4to., p. 40, &c.) The climate at Etchmiazdin near Erivan in the valley of the Araxes around Mount Ararat, Ker Porter found even in November mild and

delightful; but he observes, that the cold during winter even here is sometimes 16° or 18° below zero of Reaumur (4° and 8° 5' below zero of Fahrenheit). (*Travels*, vol. i. p. 191.) The plains verging towards Azerbaijan and Persia are said to be scorched in summer with excessive heat, and to require much artificial irrigation for the purposes of agriculture.

The soil of Armenia exhibits in many places appearances of volcanic products. This was particularly remarked by Col. Monteith in the neighbourhood of the town of Maku, situated in a narrow valley which extends from the Araxene plain near Ararat in the direction of the Lake Van; and also in the country around the lake of Goukeka.

Strabo (xi. c. 14. t. ii. p. 461) and Pliny (xxxvii. 23) notice the wealth of Armenia in precious stones and metals. Strabo, in particular, mentions gold-mines at a place named Kambala in the country of Hyspiratis (probably in the northern part of Armenia, between the rivers Kur and Phasis), which were worked by the natives at the time of Alexander's expedition. (An account of the mines in a neighbouring part of the country, ceded to Russia by the peace of Turkmanchai, in 1828, may be seen in the *Nouveau Journal Asiatique*, vol. vi. p. 152-157.) In modern times the Armenian mines have produced plenty of excellent iron and copper, which are exported to Mosul. Rich mines of gold and silver are at this day known to exist near Kebban and Argana, in the two branches of the Taurus which inclose the valley of Karpoot (antiently Sophene), through which the Euphrates passes in its way from Armenia to Syria.

Abundant mines of rock-salt are found in the valley of Kulpia, which slopes towards the Araxa, at a distance of four miles below the fortress of Koor Ougley. 'These mines,' Col. Monteith observes, 'have for many ages supplied Georgia and even the Caucasus with salt. A range of hills, bordering the valley on the east side, is apparently entirely composed of that mineral, and in the sides of these numerous excavations have been made. Under the Persians, these mines were farmed for 3000*l.* per annum, and a village of 100 families was employed exclusively in working them.'

Marco Polo (edit. of the Paris Geogr. Soc. p. 311), in his account of Armenia, notices a copious well of mineral oil near the confines of Georgia. The oil, he says, is extensively used for burning and other purposes, and people come from remote countries to get it.

The valleys of Armenia are fertile in grain, tobacco, manna, hemp, cotton, and in fruit-trees, particularly a large description of apple, and walnuts. The excellence of the Armenian cotton is noticed already by Marco Polo ('*Ibi est bambace pulcror de mundo et melior*, l. c. p. 311).

Strabo (xi. c. 14. t. ii. p. 462, ed. Tauchn.) speaks with praise of the Armenian horse. 'Horses from the house of Togarmah' (i. e. from Armenia) are enumerated by the Hebrew prophet Ezekiel (xxvii. 14) among other articles of traffic brought for sale or exchange to Tyre. Near Erivan, Sir Robert Ker Porter saw a large kind of buffalo employed for the purposes of agriculture.

Armenia seems at an early period to have been divided into the Greater and the Lesser Armenia. Armenia Minor was the part west of the Euphrates. It appears to have comprised, in the time of Strabo, the districts of Arabkir and Devriki in the present Turkish pashalic of Siwas, and those of Erzinghan and Duruperan in the pashalic of Erzerum. During part of the middle ages the country was also named Cis or Sis, in allusion to the capital of Cilicia, which for a time formed part of Armenia Minor.

Armenia Major is by native writers divided into fifteen provinces, which Saint-Martin (i. p. 65) enumerates as follows:—1. Upper Armenia, 2. Daikh, 3. Kukarh, 4. Udi, 5. Fourth Armenia, 6. Duruperan, 7. Ararat, 8. Vashburan, 9. Siunikh, 10. Artsakh, 11. Phaidagaran, 12. Akhd snikh, 13. Mogkh, 14. Gordjaikh, 15. Persarmenia.

At the present day Armenia is divided among Turkey, Persia, and Russia. The Russian frontier between the Black and the Caspian Sea commences on the Euxine at Fort St. Nicholas, about ten miles south of the river Phasis or Rion; following the course of the hills which here inclose the valley of that stream, the frontier first takes an eastern direction; it then turns southward, traverses the S.W. branch of the Kur, follows the course of the Arpat-chai to its junction with the Araxes, and after crossing the latter river proceeds S.E., straight towards the Ararat, leaving the western summit of that mountain on the Russian

side. The frontier then follows the Araxes during the greater part of its middle course, till where that river breaks through the Talidj or Talish hills: here the frontier turns south, and reaches the border of the Caspian Sea near Astara. The line which separates the Persian from the Turkish dominions in Armenia begins at Mount Ararat, and proceeds in a southern direction, following the range of hills which separate the streams falling into the Tigris and lake Van from those that run towards the Araxes and lake Urmia.

The name of the antient capital of Armenia was Artaxata, or Artaxiasata. (Strabo, xi. 14, t. 2, p. 460. Tacit. *Ann.* vi. 33, xiii. 39, &c.) It was situated, according to Strabo, on a sort of peninsula formed by a curve of the river (*ἡ περὶ ποταμὸν αἰχμή*). Tavernier, Tournefort, and Chardin, suppose that a mass of ruins, found near where the Zengay or Zenghi falls into the Araxes, marks the situation of Artaxata, and Mannert (v. ii. p. 168) adopts this opinion. To Colonel Monteith, however, the situation of these ruins did not appear to answer to the description of Artaxata: he thinks that the remains of the antient capital are situated farther down the Araxes, in a bend of the river, at the bottom of which he saw the ruins of a bridge of Greek or Roman architecture. (*Journal of the Royal Geogr. Soc.*, iii. 47.)

The German traveller Schulz discovered, in 1827, near Wan, the ruins of a very antient town, called Shamiramakert (i. e., the town of Semiramis), by Armenian historians, the foundation of which is by them ascribed to Semiramis. Mention of it is made by Moses Chorenensis, who names Maribas Catina, a Syrian writer who wrote about the year 140 before our æra, as his authority for the account which he gives of the town. Schulz found the ruins covered with inscriptions in the arrow-headed characters, many of which he copied. In one of them (an inscriptio trilinguis) the late M. Saint-Martin found the name of Ksharsha son of Dareioush (Xerxes son of Darius) mentioned repeatedly, which in his opinion can apply only to the Xerxes who led the great expedition against Greece. (See *Nouveau Journal Asiatique*, vol. ii. p. 164, &c.) According to the Armenian historians, the town of Shamiramakert was called Wan from a king of that name, who was the last but one of the Haik dynasty. (See Avdall, *History of Armenia*, vol. i. p. 44.)

The town of Tigranocerta, which according to Tacitus (*Ann.* xv. 5) was situated at a distance of thirty-seven miliaria N.E. of Nisibis, must, in the opinion of D'Anville and Mannert, be sought near the river Khabur, which they take to be the antient Nicephorus (the Kentrites of Xenophon). Armenian writers call the town Dikranagerd, and make it identical with the modern town of Kara-Amid or Diarbekr. (Saint-Martin, *Mémoires*, &c. i. pp. 170, 171.)

Magnificent ruins still exist of the celebrated antient town of Ani. They are about four miles west of the monastery of Kotchiwan, in a plain, protected towards the south and east by a deep and impassable ravine through which the river Arpatchai runs. The place is laid down on Sir Robert Ker Porter's map in 40° 32' lat., 43° 36' long. E. of Greenwich. On the history of Ani, called 'Ανίον by the Greeks, see a note by Klaproth in the *Nouveau Journal Asiatique*, xii. p. 194.

The remains of many other noble cities are still to be seen on the banks of the Araxes. The ruins of a bridge near Kara-kulla are supposed to mark the site of the antient Armavera. Farther down the Araxes, Colonel Monteith saw the ruins of a magnificent temple of Diana in the valley of Guerney.

Marco Polo (Paris edit. p. 310) in his account of Armenia, mentions an important mercantile town of the name of Laias (written also Layas and Laras in different MS. copies), where tradesmen from Venice, Pisa, Genoa, and from India (*mercatores Veneti, Pisani, et Januenses, et de omnibus partibus Indiæ*) met and exchanged their merchandise.

Abulfeda notices the following as the principal towns of Armenia: Arjish, Dabil, or Al-Dabil, Dawin, Wastan, Arzenjan, Mush, Arzen or Arzen-al-Rum (Erzerum), Melazjerd, Bidlis (Bedlis), and Akhlat. (See the geographical index to Schultens' *Vita Saladin*, s. v. Adserbejsana.) Sadik Isfahani adds Alah-tak, Wan, and Takrit. Most of these towns still exist. Erzerum or Arzen-al-Rum (antiently called Garin, and in Greek, Theodosiopolis), at a distance of fourteen days' ride from Constantinople, is the principal place of Turkish Armenia. Jaubert estimates the number of its inhabitants at 70,000. Akhalzikh, a fortress near the

river Kur, is the principal town in Turkish Georgia. Arjis or Arjish and Akhlat are antient towns on the northern and western borders respectively of the lake Wan. The town of Wan is supposed by Colonel Monteith to have at present about 20,000 inhabitants. Eriwan and Nakhshiwan are the two principal towns of Russian Armenia. The former is situated in a delightful plain watered by the Araxes, and its tributary river the Zenghi, and peopled by numerous villages: it has about 14,000 inhabitants. At a short distance from Eriwan is situated the celebrated Armenian convent of Etchmiadzin, or Etchmiatchin, the seat of an Armenian Patriarch; it was founded according to tradition by St. Gregory, A.D. 304. It is among the Turks known under the name of Utch-kilissia, i. e., 'the three churches.' This convent is all that now remains of the great city of Vagharshabad, which is supposed by Saint-Martin (vol. i. p. 115) to have been founded in the sixth century before the Christian æra.

The latest publication relating to Armenia seems to be the *Researches of the Rev. E. Smith and the Rev. H. G. O. Dwight in Armenia*, &c. 2 vols. Boston, 1833. We have not had an opportunity of consulting this work for the present article.

History of Armenia.—The Armenians call the progenitor of their nation and the first ruler of their country Haig or Haik, whose father they believe to have been Torgoma, the Thogarma of Scripture (Genesis x. 3), the son of Gomer and grandson of Japhet. Haig had originally lived in the country of Shinaar; but he retired from the oppression of the Assyrian king Belus, and established himself in the hills of the neighbouring Armenia. Belus pursued the emigrant with an armed force into his new abode, but was defeated by Haig and fell in battle. This is said to have happened twenty-two centuries before the Christian era. (Avdall, i. 6.)

About three hundred years later, Aram, the sixth successor of Haig ruled over Armenia. He signalized his reign by the conquest of part of Media, Assyria, and Cappadocia. The governor appointed by Aram in the last province laid the foundation of a town, which he called after his own name, Mishak, Majak, or Mazaca: it was subsequently named Cæsarea. The conquest of Aram first made known the people over whom he ruled, and neighbouring nations called them Aramides, and subsequently Armenians, from the name of their king. (Moses Chorenens. p. 47-49. ed. Whist.)

His son and successor, Ara, fell in a war with the Assyrian queen, Semiramis. Armenia then became dependent on the Assyrian throne, though it was still governed by native princes. King Scavordi, about the middle of the eighth century before Christ, threw off this allegiance. His son, Paroir, or Baroir, joined Arbaces and Belesis, the governors of Media and of Babylonia, in their revolt against Sardanapalus. After this, the kings of Armenia were again independent sovereigns.

In the reign of Haikak, the contemporary of Nebuchadnezzar, and the fifth king in succession from Paroir, the family of one of the exiled Jewish nobles, Shambat, came into Armenia. From him descended the great family of the Bagratians, which subsequently, about the middle of the ninth century of our æra, came to the throne of Armenia.

The next king but one after Haikak, was Dikran, or Tigranes I., who assisted Cyrus in his rebellion against Astyages and the Medes. To him Armenian authors (Moses Chor. p. 71; Avdall, vol. i. p. 41) ascribe the foundation of the city of Tigranocerta; but Plutarch and Strabo assign it to Tigranes, the contemporary of Mithridates. He was followed by his youngest son, Vahagn, who became celebrated by many deeds of valour in his wars with the Medes: the Armenians and Georgians composed and sung poems in his praise.

A corps of Armenians formed part of the Persian army in the expedition of Xerxes against Greece. They, and a corps of Phrygians, wore the same kind of armour, and were both commanded by Artochmes, a son-in-law of Darius. Herodotus, in mentioning these facts (vii. 73), expresses an opinion that the Armenians were a colony of the Phrygians; Strabo (xi. c. 14., t. ii. p. 463, ed. Tauch.) seems inclined to consider them as of Thessalian origin, but his arguments are not very convincing.

About the middle of the fourth century before our æra Vahey was upon the throne of the Haigs. He assisted Darius in his war with the Macedonians, but fell in battle in the year B.C. 328. Armenia became a Macedonian province, and was ruled by governors, the first of whom, Mita-

rices, a Persian, was appointed by Alexander three years after the death of Vahey. Already in the year 317, however, the Armenian chief, Ardwand, or Erwand (Ardoates), headed a revolution against the reigning governor, Neoptolemus, threw off the Macedonian yoke, and maintained himself for thirty-three years as an independent sovereign. After his death the Armenians were obliged to submit for a time to the supremacy of the Seleucidæ, until two Armenian nobles, Artaxias and Zariadras, availed themselves of the moment when Antiochus the Great had suffered a defeat from the Romans (B.C. 190), to declare their country free from its allegiance to the Syrian kings. Armenia was at this epoch divided into two kingdoms, that of Armenia Minor on the western, and that of Armenia Major on the eastern side of the Euphrates. In Armenia Minor the descendants of Zariadras continued to rule till the fall of Mithridates: thenceforward the country became attached to one or the other of the neighbouring states, and in the reign of the emperor Vespasian was made a Roman province: subsequently its limits were extended so as to embrace Melitene, Aravene, and part of Cataonia; and under the Byzantine emperors we find it divided into Armenia Prima and Secunda, the former governed by a consul, the latter by a *dux* (ἡγεμὼν). (See F. A. Cramer's *Geographical and Historical Description of Asia Minor*, Oxford, 1832, vol. ii. p. 148, &c.)

In Armenia Major the family of Artaxias (the Armenian Arsacidæ) maintained itself till the year B.C. 5, and gave eight, or, according to others, ten kings to the Armenian throne. The most important of these is Tigranes I. (B.C. 95-60), the son-in-law and ally of Mithridates. He rendered himself master of Armenia Minor, Cappadocia, and Syria, but lost all these conquests after the defeat of Mithridates. Lucullus invaded Armenia, and defeated near Tigranocerta the mixed and numerous army of Tigranes. (Plut. Lucull. 25, &c.) The peace concluded in the year B.C. 63 only left him Armenia. His son and successor, Artavasdes, was perfidiously seized by Marcus Antonius, and delivered as a prisoner into the hands of Cleopatra, the queen of Egypt (B.C. 34). After this time Armenia became an object of unceasing contention between the Romans and the Parthians, who alternately installed and dethroned its rulers.

In A.D. 232, Armenia was conquered by Ardashir, the first of the Sassanide kings of Persia. The country remained subject to this dynasty till Dertad, or Tiridates, the son of Khosru, and the only survivor of the Arsacide family, supported by a Roman army, made it free again. Early in the fourth century Tiridates and many of the Armenian nobility were converted to Christianity by St. Gregory, whom pope Sylvester I., in A.D. 319, confirmed as pontiff of Armenia. The conversion of Constantine to the Christian faith occurred about the same time: this circumstance, while establishing friendly relations between the Greek empire and Armenia, exposed the latter country to the increased hatred of the heathen government of Persia. New conflicts and disturbances ensued, till (A.D. 387) Theodosius the Great entered into a compact with the Persian king, Sapores, according to which the eastern part of Armenia was to belong to Persia, and the western part to the Roman empire. Sapores, with a view to conciliate the minds of the Armenian nobles, many of whom were quitting the country in disgust, appointed Khosru, an offspring of the Arsacide family, as a tributary king over Persian Armenia. In 428, however, the Persian king, Behram V., deposed Artaces, or Artashir, the last of the tributary Arsacide rulers, and, with the consent of the degenerate Armenian nobles, appointed a Persian officer to govern the country. All the efforts of the Persian court were now directed towards the suppression of Christianity in Armenia, and the introduction of the doctrine of Zoroaster, as the difference of religion appeared to be the chief obstacle to the lasting fealty of the province. On these grounds the Armenian Christians became subject to constant vexations, and even cruel persecutions, from their Persian rulers. The '*History of Vartan*,' translated from the Armenian of Elisæus, by C. F. Neumann (published by the Oriental Translation Committee, London, 1830, 4to.), exhibits a detailed and highly interesting picture of the religious wars under which Armenia was suffering about the middle of the fifth century.

Even after the fall of the Sassanide dynasty in 632, Armenia did not enjoy tranquillity, as its provinces soon became the scene of conflict between the Grecian and the

rising Mohammedan empire. In 855, during the caliphate of Motawakkel, an Arabian army, under the command of Buga, conquered Armenia: many of its principal nobles were brought to Bagdad, where the greater number of them were forced to become converts to the Mohammedan religion; only Sempad, the Bagratide, died a martyr to Christianity. His son, Ashod, gained the confidence of the Caliph, who, in 859, installed him king of Armenia. He became the founder of the Bagratide dynasty, which occupied the throne of Armenia till the year 1080. During the greater part of the tenth century, in the reign of Apas (928-951), Ashod III. (951-977) and Sempad II. (977-989), Armenia enjoyed tranquillity. Not long afterwards the country became an object of contest between the Byzantine empire and the Seljukide Turks. Gagik, the last of the Bagratide kings, was treacherously killed (1079), and Armenia, though still partially governed by native princes (the Orpeliens and others), became mainly dependent on the Greek empire, while in the northern provinces, the Turks, and in the southern parts, the Kurds, encroached upon its limits.

From the year 1226, Georgia and Armenia suffered much from the incursion of the Mogols, which continued till near the end of the thirteenth century. (See Klaproth's paper *Des Entreprises des Mongols en Géorgie et en Arménie*, &c. in the *Nouveau Journal Asiatique*, vol. xii. pp. 193 and 273.)

After the murder of Gagik, and the fall of the Bagratide dominion in Armenia Proper, Rupen, a relative of the last king, fled with his family into Phrygia, and established an Armenian principality in the Taurus mountains north of Cilicia, which gradually extended its boundaries to the coast of the Mediterranean Sea. It soon derived importance from the services which its princes rendered to the monarchs of Europe during the crusades. Leon II., who reigned from 1185 till 1219, was in 1198 crowned king of Cilicia, by Archbishop Conrad of Mainz, who was sent for that purpose by the German emperor, Henry VI., and Pope Cælestinus III.; and a crown was likewise presented to him by the Greek emperor, Alexius. The Cilicio-Armenian kingdom continued till the latter part of the fourteenth century. The last king, Leon VI., was in 1375 taken prisoner by the Mamluks of Egypt, and, after a long captivity, wandered as an exile through Europe, from one country to another, till he died at Paris in 1393. (See Vahram's *Chronicle of the Armenian Kingdom in Cilicia*, translated by C. F. Neumann, London, 1831, 8vo. Published by the Oriental Translation Committee.)

The Mamluks were soon obliged to yield up their rule over Cilicia, and part of Armenia Proper, to the Ottomans. The Armenians, now a nation without a country or home, rather than endure cruel persecutions in the land of their fathers, spread themselves all over Asia and Europe. As early as the year 1331, Armenian refugees came to Kamenz in the Lausitz (Lusatia.) Others followed the Ottoman conquerors to Constantinople (1453), where the Grand Signior gave them a patriarch. They were well received in Russia, where numbers established themselves at New-Nakhchivan, on the Don, at Moscow, and at St. Petersburg. In 1605 twelve thousand families were led forcibly away from Armenia into Persia, by the command of Shah Abbas. They settled at Julfa, one of the suburbs of Ispahan, giving to this quarter of the city the name of their city, Julfa, on the Araxes, in Armenia. Many who still remained at Tauriz, Erzerum, Kars, and Bayazid, have recently withdrawn to the Russian provinces south of the Caucasus. Armenian merchants are now found established in India, on the islands of the eastern Archipelago, in Singapore, in Afghanistan, Persia, in every part of Asia Minor, in Syria and Egypt, and in nearly all the countries of Europe. Almost every important fair or mart, from Leipzig and London to Bombay and Calcutta, is visited by them.

The *Armenian language*, observes M. Klaproth (*Encyclopédie des Gens du Monde*, t. ii. p. 298), is rough, and overcharged with consonants. Besides a great number of Indo-Germanic roots, it shows many analogies to the Finnic dialects of Siberia, and other languages of northern Asia. According to Balbi (*Atlas Ethnographique du Globe*) and Adelung (*Mithridates*, vol. i. p. 420, &c.), the Armenian does not belong to any known family of languages, but stands quite alone. Its grammar is excessively complicated: like the northern languages of Europe, it has an article attached to the end of words. It does not distinguish the

genders. The declension has ten cases in the singular and plural; and in the conjugation of the verbs we find a corresponding copiousness of inflection. The antient or literary Armenian is so different in its grammar and structure from the present Armenian that it may be considered as a dead language. In good Armenian authors, of any age or country, no diversity of dialect is observable. The construction resembles that of the Greek language. Into the modern Armenian many foreign words have been introduced, especially from the Turkish; the grammar is altered, and the construction of sentences is modelled after the fashion of the Turkish language.

To those who wish to study the Armenian language the following works are recommended:—J. J. Schröderi *The-saurus Lingue Armenicæ antiquæ et hodiernæ*. Amst. 1711. 4to. *A Grammar, Armenian and English*, by Father Paschal Aucher. Venice, 1819. 8vo. *Dictionnaire abrégé Français-Arménien*, par Paschal Aucher. Venice, 1812. 2 vol. 8vo. *Choix de Fables de Vartan en Arménien et en Français*. Paris, 1825. 8vo.

Armenian Literature.—Previous to the introduction of Christianity, the religion and civilization of Armenia appear to have been similar to those of the neighbouring Persians and Parthians. With the exception of a few fragments of antient songs preserved by Moses Chorenensis, we possess no literary remains out of this period. With the Christian religion, however, a taste for the study of the Greek language and literature became prevalent. Till the beginning of the fifth century, the Armenians, in writing their language, used various foreign alphabets—the Persian, the Greek, or the Syrian, particularly the latter; but as the number of characters in these alphabets was insufficient to express all the sounds of the Armenian language, Mesrob invented, for the use of his countrymen, a particular alphabet written from the left to the right, and originally consisting of thirty-six characters, to which, subsequently, two more were added. This alphabet, which was introduced in the year 406, is that which the Armenians still use.

The continuous succession of writers, in various departments of literature, which Armenia has produced from the commencement of the fourth century down to our own age, and the zeal with which the Armenians, since their dispersion, have established printing-offices wherever they have settled in any considerable numbers, prove their fondness for the cultivation of letters. They either have, or have had, printing-offices at Amsterdam, Leipzig, Venice, Leghorn, at Leopold in Poland, at Constantinople, at Smyrna, in several towns of Russia, at Astrakhan, at Etchmiadzin, at Julfa near Ispahan, at Madras, and in several other places.

Besides the alphabet of which he was the inventor, Mesrob presented his countrymen with a translation of the Bible, made, as far as the Old Testament is concerned, from the Septuagint; but the Greek text, from which we must suppose it to have been made, does not agree altogether with any one of our recensions. The Armenian version is supposed by some critics to have been interpolated in the sixth century from the Syriac Peschito, and in the thirteenth from the Latin Vulgate.

The Armenian historians are valuable on account of the information which they supply on the history of the Byzantine empire, of the Sassanidæ, the Mohammedan Arabs, the Seljuks, the crusades, the Mogols, and, in short, on the entire history of the East since the fourth century. They show, upon the whole, more judgment than the Arabian and Persian historians in the selection of the facts which they record, and display a better taste in their manner of relating them: some appear rather too fond of interrupting the narrative by long strains of pious meditations. The Armenian chronicles should, however, be used with caution, particularly as regards the more remote periods of history. Saint-Martin has pointed out an important anachronism, into which, he says, Gibbon has been led by Moses Chorenensis, regarding the history of Armenia contemporary with the reigns of Constantinus and Constantius. (*Nouveau Journal Asiatique*, t. iv. p. 402, &c.)

The most antient Armenian historian probably was Agathangelus, the secretary of King Tiridates, early in the fourth century. The authenticity of a chronicle which is attributed to him seems, however, to be questionable.

Zenob, a Syrian by birth, pupil and secretary to St. Gregory, lived early in the fourth century. To him is ascribed a chronicle of the province of Daron, which was written at Constantinople, 1719, 12mo.

Moses of Khoren, or Khorni, in the province of Daron, surnamed Kerthogh, or Kerthoghair, i.e. 'the grammarian poet,' is considered by the Armenians as the first of their classical writers. He had from his early youth attached himself to Sahag (or Isaac), the patriarch of Armenia, a descendant of St. Gregory, who, in concert with Mesrob, most zealously endeavoured to propagate Christianity, and to diffuse a love for knowledge among his countrymen. Moses was by him sent to Alexandria (A.D. 434) in order to make himself perfectly familiar with the Greek language. He remained there several years, and returned to Armenia (442) by way of Rome, Athens, and Constantinople. Moses was subsequently raised to the archiepiscopal see of the provinces Pakrevant and Ardzruni, and died in A.D. 487, it is said at the age of 120 years. We possess a Chronicle by him, divided into three books (edited, in Armenian and Latin, by the brothers Whiston, London, 1736, 4to.), in which he gives the history of Armenia from the time of Haig down to the death of Mesrob and Sahag; also a treatise on rhetoric, and a work on geography. Saint Martin is also inclined to ascribe to Moses of Khoren an Armenian translation of the *Chronicon* of Eusebius (edited, in Armenian, by Aucher, at Venice, in 1818, and in Latin, in the same year, by Mai and Zohrab, at Milan), which was printed from an old MS. on vellum, found in 1794 by Zohrab at Constantinople.

Eliseus, or Eghishe, a contemporary of Moses of Khoren, was secretary to Vartan, a prince of the family of the Mamigonians: in 449 he was appointed bishop of the district of the Amadunians. He wrote a history of the religious wars of Vartan with the Persians, of which he himself had been eye-witness. An English translation of this work, by C. F. Neumann, was published at London in 1831 by the Oriental Translation Committee.

Another distinguished contemporary of Moses Chorenensis was the philosopher David. He visited Athens where he attended the lectures of Syrianus, the teacher of Proclus; he afterwards went to Constantinople, where he seems to have remained for a considerable period. He died in Armenia, it is supposed, early in the sixth century. (See C. F. Neumann's *Mémoire sur la Vie et les Ouvrages de David*, in the *Nouveau Journal Asiatique* of 1829.)

Lazarus of Parb (Parbetsi), surnamed the Rhetorician, who flourished in the sixth century, wrote a history of Armenia during the years 386-486. (Printed at Venice in 1793.)

Thomas the Ardzrunian, a contemporary of Lazarus, wrote a history of the life of Vartan, and subsequent events. down to the year 500.

Joannes, bishop of the Mamigonians, lived in the seventh century. He wrote a history of Armenia from the commencement of the third century till the year 640. It was printed at Constantinople in 1719.

Anias Shiraguzi, in the seventh century, is the author of several biographical, astronomical, and chronological works.

Joannes Catholicus, in the ninth and tenth centuries, wrote a history of Armenia from Haig till the reign of the Bagratian king, Ashot II. (A.D. 920.) This work, which yet remains unpublished, is considered by the Armenians a model of elegant style.

Matthias Erez, of Edessa, in the twelfth century, wrote a chronicle which comprehends the history of Armenia from the reign of Ashod III. (A.D. 951) till the establishment of the Armenian principality in Cilicia (A.D. 1128.) This work was continued by Gregory, in the same century, as far as the year 1161.

Samuel of Ani (Anetsi), likewise in the twelfth century, wrote a concise but accurate chronological work, extending from Adam to the pontificate of Gregory Vikayaser (A.D. 1164.) It has been continued by others till the year 1337.

Nerses Klaietsi, surnamed Shnorhali (i.e. 'the graceful') was born shortly before the close of the eleventh century and died in 1173. During the last twenty-six years of his life, he resided at Hromkla, commonly called Rumkala, a fortified place on the Euphrates. He is considered as the inventor, or principal cultivator, of rhymed poetry. With the exception of a brief history of Armenia, his works are mostly theological. (According to Gregorios Magistros, an Armenian writer of the eleventh century, the Armenians received their theory of prosody and rhyme from the Arabs, and Sahlum the son of Shahpu, and Aharon the son of Kahan were the first Armenian poets.)

Nerses Lampronetsi, the nephew of the former, was born

in 1153, and died in 1198. His writings are almost exclusively homiletical and liturgical.

Vartan, a pupil of the monk Vanagan, in the thirteenth century, wrote a history of Armenia, commencing with the earliest times, and going down as far as the year 1272. This work is considered valuable on account of the information about the history of the countries bordering upon Armenia, and of the accuracy and criticism shown by the author.

Vahram, a native of Edessa, and secretary to King Leon III. of Cilicia (who reigned from 1269 till 1289), is the author of a short history of the Armenian kingdom in Cilicia. A more comprehensive work, on the same subject, was written by Sempad, towards the end of the fourteenth century.

After the fourteenth century, we find Armenian literature on its decline. With the exception of a valuable work on the history of Armenia, by Michael Chamchcan, which was printed at Venice in 1786 (3 vols. 4to.), we hear of scarcely any work of merit. (See *Quadro della Storia Letteraria di Armenia, estesa da P. S. Somal*. Venice, 1829, 8vo.)

For about a hundred years, there has existed at Venice a congregation of Armenian monks, who are constantly publishing works on religion, theology, literature, and science, such as they think likely to benefit their countrymen. They dwell on the little island of San Lazzaro, and call themselves Mekhitaristes, which name they derive from that of their founder, Peter Mekhitar, who fixed himself at Venice in 1717. (See *A brief Account of the Mechitaristic Society, founded on the island of S. Lazzaro*. By Alexander Goode. Venice, 1825. 4to.) They have a printing-office well stocked with Armenian types, formerly cast at Amsterdam under the directions of Lucas Vanant. Many important works of a general interest have already come from the Armenian press of San Lazzaro: one of the latest is an edition, in Armenian and Latin, of three *Sermoes* of Philo the Jew, the Greek original of which is lost. The Armenian text is taken from a MS. written in A.D. 1296, which Zohrab discovered at Leopold in Poland, in 1791, collated with another copy made in the year 1298, and found in the library of the Armenian patriarch at Constantinople.

The Armenian Christians adopt the Apostolic, the Nicæan, and the Athanasian creeds, but reject the decrees of the Council of Chalcedon, and follow the doctrine of Eutyches and of the Monophysites, in admitting but *one nature* in the person of Christ, viz., that he is God only: this is, in the rite of their church, symbolically expressed by the use of red wine, unmixed with water, in the Lord's Supper. They assert that the Holy Ghost proceeds from the Father only, who accordingly, in their profession of faith (Schröder, *Thesaurus Lingue Armenicæ*, p. 251), is called *genitor Filii et spirator Spiritus Sancti*, while the Holy Ghost is described as *procedens a Patre, coessentialis Patri et gloriosus Filio*. They have the seven sacraments of the Catholic church, viz., Baptism, the Lord's Supper, Confirmation, Matrimony, Consecration of Priests, Confession of Sins, and Extreme Unction. They admit the doctrine of the transubstantiation of the bread and wine used in the Lord's Supper, which they administer under both forms to laymen as well as to ecclesiastics, though deviating from the rite adopted by other Christian sects, by dipping the bread into the wine. The Armenian clergy are divided into monastics and seculars. The former (under which class are comprised patriarchs, archbishops, bishops, doctors, monks, and hermits) live in celibacy; the secular clergy, i. e. the officiating priests, are permitted and advised to marry. The Armenian Church does not acknowledge the supremacy of the Pope. It was, at the beginning of the last century, governed by four patriarchs, who resided at Etschmiadzin, Sis, Aghthamar, and Gandsasar. The number of their bishops was calculated to amount, about the same time, to between fifty and sixty.

The Armenian Christians have an æra of their own, according to which they count their years, and which commences with the year 551 of our Dionysian æra. Their year is a moveable solar year. (See Ideler, *Lehrbuch der Chronologie*, p. 439, &c.)

ARMENIACA. [See APRICOT and PRUNUS.]

ARMENTIÈRES, a town in France in the department du Nord, close upon the Belgian frontier, and ten miles W.N.W. of Lille, the capital of the department. It is a neat little town on the river Lys, the navigation of which con-

tributes to its trade. The population is variously given at 6000 (Balbi) and 7700 (Malte Brun) persons, whose chief occupation is spinning flax, hemp, and cotton yarn. Some trade in woollen and linen cloth, lace, and leather, is carried on: also in bricks, of which great quantities are made in the neighbourhood. Armentières, when a frontier town of Flanders, was of some importance as a place of strength: and suffered much in different contests between the French and the Flemings; but upon its capture by Louis XIV. in 1667 it was dismantled. 50° 41' N. lat., 2° 52' E. long. of Greenwich. (M. Brun; Balbi; *Dictionnaire Universel de la France*, &c.)

ARMIGER. [See ESQUIRE.]

ARMILLA, a bracelet, or large ring, for the wrist or arm. The wearing of the Armilla, or bracelet, as an ornament, is of very high antiquity. It occurs in Genesis, chap. xxiv. 22, 23, where Abraham sends his servant to seek a wife for Isaac. The Amalekite who slew Saul (2 Sam. i. 10) 'took the crown that was upon his head, and the bracelet that was on his arm,' and brought them to David.

The Armilla, or bracelet, as a decoration for both sexes was perhaps the most universal of all ornaments—common to almost every nation, and far more general than the *torques*, or collar for the neck. It was sometimes worn upon the wrist, sometimes near the shoulder, and occasionally upon the ancles. Bartholinus, in his treatise *de Armillis Veterum*, asserts, that it was of such general use as to be worn even by slaves, when they could obtain permission from their masters. This accounts for the great number of armillæ which have been found, of a slender shape and mean form, in bronze, in different countries once possessed by the Romans.

As an ornament of dress, the Armilla is frequently spoken of as massive. Livy (l. i. c. 11) says the golden bracelets of the Sabines were of great weight. Petronius Arbiter (c. 67) speaks of the Roman women as wearing bracelets of six pounds and a half, and even of ten pounds weight, though the fact seems incredible.

It is not, however, as a mere ornament of dress that we are to consider the armilla; its most important use was as a gift of reward. Ælian (*Hist. lib. i. c. 22*) says the Persian kings rewarded all ambassadors, whether from Greece or other nations, with presents of armillæ. Plutarch, Xenophon (*Anabasis*, i. 2. 27), and Herodian, all allude to them as military or royal gifts.

Livy, in his account of the Samnite war (l. x. c. 44), says that at Aquilonia, Papirius, who had been engaged in various service, in the field, the camp, and the city, gave *armillæ* and coronets of gold to Spurius Nautius, to Spurius Papirius his own nephew, to four centurions, and to a whole band of the hastati. To the horsemen also, as a reward of valour, he gave armillæ and little horns of silver.

The gift of the *golden armilla*, however, was reserved peculiarly for the Roman citizen. Pliny says, to auxiliaries and strangers they give gold torques; to their own citizens only silver. But, exclusive of these, the Roman citizens have armillæ given them, which foreigners have not. (*Hist. Nat. l. xxxiii. c. 10*.)

Aulus Gellius, in the eleventh chapter of his second book, describing the exploits of Dentatus, says he was called the Roman Achilles; that he had been in more than a hundred and twenty actions; that he had never received a wound in the back, but that he had five and forty wounds in front; and that among his rewards he had achieved eight golden crowns, one obsequial, and three mural crowns; that he had received eighty-three torques, and more than a hundred and sixty armillæ. (*Noct. Att. l. ii. c. 11*.)

Gruter (Inscript. mxcvi. 4) has preserved a monumental inscription in memory of Lucius Lepidius, who had served in different legions, and received various armillæ, torques, and other ornaments, as rewards, from the Emperor Vespasian. Smetius (fol. lxxiii. b.) gives another, for a soldier upon whom both torques and armillæ had been bestowed by Trajan. Numerous other such inscriptions will be found in the different collections. Brissonius has given the formula of one of these donations: '*Imperator te Argentis Armillis donat*.'

The draconarii, or standard-bearers, wore armillæ. See *Amplianus Marcellinus* (l. xx. c. 4), where the soldiers crown Julian with one of them.

There was another use to which the armilla or bracelet was applied from the very remotest ages of the world. It

was used as an offering. In the Book of Exodus bracelets are included among the free gifts for the tabernacle.

Offerings of serpentine armillæ, or torques, were also made to *Æsculapius*.

Gifts of armillæ, however, were not confined to the warriors of Greece and Rome. The practice was as prevalent in the remoter regions of the north. The fragments which remain of the compositions of the Scaldic bards are full of allusions to the gift of bracelets. Snorro Sturleson's History affords ample proof of this. Hrolf Krake, King of Norway, whose reign is ascribed to the fifth century, is mentioned as bestowing them by Saxo Grammaticus. (*Hist. Dan.* ii. p. 29.) In the Saxon Chronicle, under the year 975, the English Edgar is expressly called *beopna beah-gyfa*, the *bestower of bracelets*, the rewarder of heroes; a term, indeed, usual as an epithet for a great chieftain in most of the Saxon poems. It occurs no where more frequently than in the song of the Traveller, and in the well-known poem of Beowulf.

Nor were armillæ gifts of reward made in person only; we find them frequently mentioned as legacies in the Saxon wills. In the will of Brihtric and his wife Ælfswytha (he was one of the Thanes of Archbishop Ælfric), preserved in the Textus Roffensis, among the articles which formed a legacy to the king, we have a bracelet of gold of the weight of eight mancuses; and to the queen a bracelet of thirty. In the will of Wulfer, which follows the will of Brihtric in Dr. Hickes's Thesaurus, we find a legacy of a bracelet of sixty mancuses. (*Dissert. Epist.* p. 51.)

William of Malmesbury informs us, that when Earl Godwin made his peace with Hardiknut, in the year 1040, he sealed it by a magnificent present—a ship, whose stern was richly ornamented with gold; and within it, eighty soldiers, each clothed in the most sumptuous habiliments of war, with armillæ of pure gold on both arms, each weighing sixteen ounces. (W. Malmesb. edit. Francof. 1601, l. ii. p. 77.) The same writer (p. 102), describing the manners and customs of the English in 1066, upon the conqueror's arrival, says their arms were laden with golden bracelets: "*Armille aureis brachiis onerati*."

Arngrim Ionas, in his work on Iceland, speaking of the pagan rites which were used in the chief temple of southern Iceland, in the isle of Kialarnes, describes an armilla of twenty ounces weight, which was kept upon the altar, and which, being sprinkled with the blood of victims, was touched by those who took any solemn oath. He says it was either of silver, or silver and brass mixed. (*Crymog. Rer. Island.* l. i. p. 63.) He adds, that for this purpose it was worn upon the Judge's arm during trials. (*Ibid.* p. 76.)

There is a passage in the Saxon Chronicle, under the year 876, which refers to a ceremony not altogether unlike the practice in Iceland. It says, that when the Danes made their peace with the English Alfred, at Wareham in Wessex, they gave him the noblest among them as hostages, and swore oaths to him upon the holy bracelet.

Armillæ, as we learn from Bartholinus, were sometimes marriage presents. Virgins, it appears, did not usually wear them. (*De Armill. Vet.* p. 79.) From different passages in the Roman classics, we learn that they were sometimes given as birth-day presents. Placed among treasures, there was a superstition that an armilla would augment them. Lovers thought them efficacious; and ivory armillæ were used in the cure of epilepsy. See other superstitions in Pliny. (*Hist. Nat.* ed. Harduini, tom. ii. 451, 11; 472, 10; 531, 22.) Armillæ are still used as playthings for children.

Among the articles which from time to time have been turned up in the bogs of Ireland, armillæ of gold have not been the least numerous. Some years ago, several in this metal, of different sizes, were found under Beachy Head in Sussex, amongst the chalk which the tide had undermined. Two or three of these are still preserved in Mr. Payne Knight's collection of bronzes.

The Hamilton, Townley, and Knight collections of antiquities, in the British Museum, contain armillæ in great quantities, and of almost every variety of form, in gold, in silver, and in bronze. See the Hamilton Room, Case 68; Mr. Knight's collection, Case 8; and the Hamilton and other gems.

In vol. xii. of the *Archæologia*, pl. li., a bronze armilla is engraved, found upon the wrist of a full-sized skeleton at Westwang Field in the East Riding of Yorkshire. See also, in the same work (vol. xxiii. p. 285) some observations upon an antient bracelet of bronze, found on the sand-hills of Altyre on the coast of Murrayshire from these observa-

tions many of the materials for this account of the armilla have been derived.

ARMILLARY SPHERE. The Latin word *armilla* signifies a bracelet, and the armillary sphere is one in which the principal circles of the heavens are constructed of some solid material, and put together into their relative positions; thus presenting the appearance of a hollow sphere, of which all the surface has been cut away except the equator, ecliptic, colures, &c. This instrument is now little more than a toy, the complete sphere being generally preferred for the purposes of instruction; but in the antient astronomy, and even so late as the time of Tycho Brahé, an instrument, the simple description of which is, that it was the whole or part of an armillary sphere, was extensively used in astronomical observation. On this point we refer the reader to **ASTROLABE**.

ARMINIANS are the followers of James Arminius, or those who are considered to entertain his sentiments. It does not appear that the conference in which Arminius was engaged at the time of his death, was productive of any good effect upon the state of party feeling in Holland. The government, however, were evidently leaning towards his side; for in the following year (1610), on sending an embassy to France, Uitenbogaert was appointed chaplain. At Paris Uitenbogaert had frequent conferences with the celebrated J. Casaubon, who was then overseer of the Royal Library at Paris, although a Protestant. These conferences served to strengthen Uitenbogaert in the opinions which he had adopted, inasmuch as Casaubon, for the most part, agreed with them.

In the mean time, during the absence of Uitenbogaert in 1610, the disputes went on in Holland with increasing violence. They had now spread so widely that nearly all the country were engaged in them, clergymen and laymen, the learned and unlearned. A large majority of the clergy and leading religious men adopted the sentiments of Gomar, and espoused his cause. The Arminian party, fearing that matters would come to extremities, and that their party might be crushed, drew up a representation of their sentiments, which was presented to the States-general, and was named by its authors *Remonstratio*, or Remonstrantie, that is, Remonstrance. This gave rise to the name Remonstrants, by which the party has been usually called on the continent of Europe, from that time to the present. The Wesleyan Methodists call themselves Arminians. and their magazine appeared formerly under the title of the Arminian Magazine. [See REMONSTRANTS; OLDEN BARNEVELD; GROTIUS; DORT; EPISCOPIUS; BOGEMANN; HEINSIUS.]

ARMINIUS. James Arminius (called in Latin Jacobus Arminius, and in Dutch Jacob Hermanni, or von Harmine, or Harmensen) was born in 1560, at Oudewater, a small but pleasant and thriving village in South Holland. His father died while he was an infant. It happened, however, that there was at Oudewater a priest called Theodore Emilius, distinguished for erudition and piety, who had forsaken the Romish church, and had emigrated from place to place in order to avoid its persecution. Moved by compassion for the indigent condition of Arminius, Emilius took him under his care, instructed him in the learned languages, and inculcated frequent lessons of practical piety. He became so interested in the extraordinary talents and rapid improvement of his young pupil, that he continued his education until he was sufficiently advanced in his studies to be sent to a university. It appears that some time before his death Emilius had removed to Utrecht with his pupil; and there he died, leaving the young Arminius without any means of support. Soon after this event, however, the youth obtained a second patron in Rodolph Snell, a native of Holland, who on account of the incursion of the Spaniards had been obliged to quit his residence at Marburg in Hesse. Snell was himself distinguished for his knowledge of the mathematics. He soon returned to Hesse, accompanied by his young pupil; but he had scarcely arrived there before news came that the Spaniards had taken Oudewater, burnt it, and massacred all the inhabitants. Arminius set out immediately for his native place: on his arrival, he found it a heap of ruins; every house was burnt, and his mother, sister, brother, relations, and nearly all his fellow-townsmen, murdered. He returned immediately to Hesse, performing the whole journey on foot. Here, however, he did not stay long. News reached him that the University of Leyden had been founded by the prince of Orange, on which he set out once more for Holland, and at first repaired to Rot-

terdam, then an asylum for the surviving sufferers at Oude-water, and also for many refugees from Amsterdam.

At Rotterdam, Peter Bertijs, the father of P. Bertijs who afterwards wrote the funeral eulogy of Arminius, was persuaded to receive him into his own family; and he afterwards sent him, with his son P. Bertijs, to the University of Leyden. Here young Bertijs was the constant companion of Arminius, whom he describes as exceedingly devoted to literary pursuits. Arminius cultivated the study of poetry, mathematics, and philosophy, and became the ornament and example of the whole class to which he belonged. His principal instructor in theology was Lambert Danæus, who had taught at Geneva, and was distinguished by his knowledge of the Christian fathers and the scholastic divines.

After remaining at Leyden about six years, the senate of Amsterdam, being moved by the high reputation for brilliant talents and extraordinary application which Arminius had acquired, sent him in 1582, at their own expense, to Geneva, then the head-quarters of the reformed Calvinistic churches. Here he enjoyed the instruction of the celebrated Beza, the friend and successor of Calvin, in the famous theological school of Geneva. But he soon created a prejudice against himself among the leading men in this school on account of his enthusiastic attachment to the philosophy of Ramus, which he taught to his fellow-students in private, and which he boldly and zealously defended in public. The philosophy of Aristotle was at that time considered as the summit of perfection, not only at Geneva, but in all the schools and universities of Europe. The views of Ramus were opposed to this philosophy; and of course Arminius, who appeared as a zealous advocate for the opinions of Ramus, could not expect to meet with the approbation of the instructors at Geneva. Accordingly he was soon obliged to quit the place, and he immediately repaired to Basle, where Jacob Grynnæus was then a distinguished teacher. Here he won so much applause and admiration by his attainments and devotedness to study, that he was speedily offered a doctorate in theology by the theological faculty at Basle, being at that time only twenty-two years of age. This, however, he declined, deeming himself too young to be made the subject of such an honour.

The commotion excited at Geneva by his opposition to the philosophy of Aristotle, soon began to subside in his absence. In 1583 he returned to Geneva. His own feelings were now greatly moderated on the subject of Ramus's philosophy, and he appears to have lived in tranquillity during his second residence at Geneva. How long he remained here during his second residence is not well ascertained; but as he returned to Geneva in 1583, and went into Italy in 1586-7, it seems probable that his stay was about three years.

He was attracted to Italy by the philosophic fame of James Zabarella of Padua, whither he went, attended by a young Hollander, his constant companion. After hearing a course of lectures, he travelled through Italy, visited Rome, then returned to Geneva for a short time, and soon after to Holland. While on his travels, he and his companion carried with them a Greek Testament and a Hebrew Psalter, which they read daily, in their exercises of devotion. In 1587 Arminius returned to Holland, and on repairing to Amsterdam he found that reports had been circulated there greatly to his disadvantage, respecting his favourable views of the Roman Catholic religion. Among other things, it was said that he had kissed the Pope's feet; that he was intimate with Jesuits; that he was introduced to Cardinal Bellarmine; and that he had renounced the Protestant religion. All this was entirely false.

Arminius found his patrons at Amsterdam cold and suspicious when he first returned. He succeeded, however, in satisfying them that he had been slandered, and he soon received an invitation as minister in one of the churches at Amsterdam, over which he was placed in 1588, being then twenty-eight years of age. On his return from Italy he had passed through Geneva, where Beza gave him a letter to his patrons, in which he speaks highly of him as 'animo ad faciendum officium optime comparatus, si Domino Deo placeret ipsius uti ad opus suum in ecclesia sua ministerio.'

Arminius soon became exceedingly popular as a preacher at Amsterdam. His sweet and sonorous voice, his manner, his ardour, his distinguished talents, and finished education, all combined to give him extensive popularity and influence. The rumours which had been set afloat concerning his inclination towards Catholicism gradually died away, and all

classes of men united in extolling his talents as a preacher and a pastor.

Volkerts Coornhart, a man of distinguished talents and learning, who lived at this time at Amsterdam, was strongly opposed to the doctrine of predestination as held at Geneva and in Holland, and had written much against it. Two ministers at Delft, Arnold Cornelius and Renier Duntelok, had undertaken, in conference and by writing, to oppose Coornhart. In order to do this, however, as they thought to the best advantage, they had relinquished the views of Calvin and Beza in respect to the *decretum absolutum*, viz. the doctrine that the decree of election and reprobation preceded all respect to the fall of man and to his obedience or disobedience. This is what has since been called supralapsarianism. On the other hand, the ministers at Delft maintained, not only that God in his decree regarded man as created, but also that he had respect to his lapsed condition. This is what has since been called sublapsarianism. The work which the Delft ministers published at this time, entitled 'Answer to some Arguments of Calvin and Beza on the subject of Predestination,' first gave rise to these denominations in the Christian church. The book of the Delft ministers, containing strictures on the supralapsarianism of Calvin and Beza, was sent by its authors to Martin Lydius, then professor of theology at Franeker. He was dissatisfied with it; but instead of undertaking to answer it himself, he solicited Arminius to defend his teacher, Beza. This Arminius was at first inclined to do; but, after a thorough perusal of the answer, he suspended his purpose, as his mind had been filled, by the perusal of the book, with doubts or difficulties in regard to some positions of Beza and Calvin. In 1597 Arminius repaired to Leyden, to confer with the celebrated F. Junius, who was then professor of theology there. The result of this was a long and amicable correspondence on the subject of decrees, necessity, liberty, &c., which is published in the works of Arminius. Junius treated these subjects with mildness and great ability, but he did not satisfy the scruples of his friend.

Uitenbogaert,* a very popular and able minister, at this time resident at the Hague, was known to sympathize in sentiment and feelings with Arminius. To him Arminius wrote, beseeching him to assist in the examination of the difficult questions in which he was engaged. Uitenbogaert, as appears by the sequel, entered warmly into his views.

In 1598 Arminius wrote his 'Examen Modestum Libelli Perkinsii, T. E.,' or his examination of a treatise in defence of predestination, which Perkins, an Englishman, had published under the title of 'Armilla Aurea.' In 1599 Arminius and his friend Uitenbogaert endeavoured to move the states of Holland to order a new translation of the Bible to be made by that excellent scholar Drusius. But in this they failed, owing to a strong suspicion entertained by many of the clergy, that they were aiming at the overthrow of the opinions then prevailing in the churches of Holland.

In 1600 Arminius opposed those of his brethren who were urging an annual subscription of all the ministers to the creed and catechism of the churches in Holland. In 1602 the plague made dreadful ravages in this country, and particularly at Amsterdam. Arminius is said to have distinguished himself greatly by his attention and kindness to the sick and to those who lost their friends. During this plague F. Junius and L. Trelocatius, professors of divinity at Leyden, died, and the curators of the university in 1603 elected Arminius to fill the place of Junius. It was only by the interposition of the curators at Leyden and of the leading men in the government of the states, that the synod at Amsterdam could be persuaded to allow Arminius to leave his church at Amsterdam; a fact which strongly marks the attachment of the people to their minister.

It is said, that F. Gomar, a distinguished professor of theology in Leyden at this time, was opposed to the election of Arminius. Soon after the new professor entered on his office, he and his colleague Gomar were brought to a friendly conference, in which Arminius explained himself so plainly and fully against the doctrines of Pelagius, that Gomar professed to be satisfied. But during the next year Arminius delivered a lecture on predestination, in which he maintained that God had eternally decreed to save believers and to punish the impenitent; the one to the praise of his glorious grace, the other in order to display his power and

* The name occurs in various forms: Uitenbogaert, Uitenbogaert, &c.—We have adopted that orthography which occurs in some old Dutch books.

ats indignation against sin. Arminius doubtless meant that God had respect in his decree to the belief of the one and the unbelief of the other. Gomar openly attacked this lecture; Arminius replied; and thus commenced a dispute which has not yet subsided. Gomar carried it on actively during the rest of his life. The students of the university soon became engaged in it, and were divided; a part held with Gomar, but the majority with Arminius, whose lecture-room was always crowded.

This state of things very naturally took hold of the public sympathies. The ministers of the Gospel became divided, as well as the students of the university; but the majority appear to have taken the side of Gomar and to have blamed Arminius. As the contest went on, the teachers of religion began first to dispute, then to preach and write against each other, until all Holland was in a state of religious war. In 1604 some theses of Arminius on the divinity of Christ occasioned him new trouble. The matter related to the epithet *αὐτόθεος* as applied to Christ. Arminius explained it according to the Nicene Creed, in which the term occurs, *very God of very God*. His opponents gave it the contrary interpretation, that is, 'One who is God of himself, and has his essence from himself and not from the Father.'

In 1607 the ministers of Gouda published a catechism, which for the most part was expressed in the language of Scripture, and was intended to be simple and brief. Arminius was accused of favouring this catechism, which, it was averred, would open the flood-gates to all manner of error. All these occurrences served to increase the excitement in Holland. This finally rose so high that the States-general were called upon by Arminius and Uitenbogaert to convoke a general synod, before which Arminius might defend himself. The supreme court admitted Arminius and Gomar to a conference before them, and the result was, that this council informed the States-general that the disputes between the parties were on intricate points of little or no importance; and that, with respect to them, a man might believe either one way or the other without forfeiting his faith or injuring the church (*salvâ fide et salvâ ecclesiâ*). The States-general enjoined the parties to drop their disputes, and to teach nothing against the creed or the catechism.

The attempt of the government to put a stop to the disputes concerning religion, although well-meant, was entirely unsuccessful. Arminius and Gomar still carried on their theological warfare; the students of the university, of course, followed their example, and ministers through the country, and, finally, private individuals, became deeply engaged, on one side or the other, in this contest.

In the same year, 1608, Arminius was summoned by the States-general to appear before them at the Hague, and give them an account of his sentiments. This he did in his famous 'Declaratio,' published in his works. The States-general, as a body, were at this time inclined to favour Arminius. But the disputes continuing with increased violence, in the next year (1609) they summoned Arminius and Gomar before them once more, each accompanied by four ministers of his own party, in order that they might hold another conference in their presence. This was soon interrupted by the sickness of Arminius. Gomar and his friends insisted on a general synod, knowing that they had a majority of the clergy on their side. Uitenbogaert, the special friend of Arminius, who was present as one of his assistants, warned the States against being prejudiced by the violence and the number of the opponents of Arminius. He expressed an entire willingness to have a general synod; he only remarked, as Beza once said, that he did not wish Satan to be the president of it.

In the mean time Arminius died, on the 19th of October, 1609. His last sickness was exceedingly severe. Exhausted by the fatigues of body and mind which he had undergone during the many years of his theological warfare, deeply wounded by the ill-reports which the heat of dispute had engendered and zeal against him had extensively circulated, he fell under a complication of diseases—fever, cough, atrophy, and arthritis. It is said, that notwithstanding all his sufferings he died with great calmness and resignation, lamenting the evils to which the Church had been exposed, and earnestly praying for her peace and prosperity. In his last will, made on his death-bed, he solemnly testifies that he had, with simplicity and sincerity of heart, endeavoured to discover the truth by searching the Scriptures, and that he had never preached or taught anything which he did not believe to be contained in them.

ARMINIUS. [See HERMANN.]

ARMLEY, a chapelry in the parish and borough of Leeds. [See LEEDS.]

ARMORICA, ARMORICÆ CIVITATES, the name given, in the time of Cæsar, to the maritime districts of Celtic Gaul, situated between the mouth of the Ligeris (Loire) and that of the Sequana (Seine); the word is derived from the Celtic, *ar mor*, which means 'near the sea.' That tract of country was occupied by several tribes, the Veneti, Osismii, Curiosolites, Rhedones, Caletes, &c., who formed a sort of confederacy. Their towns and fortresses were built along the coast, and they had a considerable fleet, with which they carried on an intercourse with the opposite coast of Britain. Being subdued by the Romans, after repeated struggles, they formed part of the province called Lugdunensis Secunda, which was afterwards subdivided into Secunda and Tertia; the maritime districts of this province were styled *Armoricanus tractus*, and nearly corresponded in extent to the modern French provinces of Brittany and Normandy. (D'Anville, *Notice de l'ancienne Gaule*.) Maximus, a Roman officer, having revolted with the legions of Britain against the Emperor Gratian, A.D. 383, passed into Gaul with two legions and a large number of islanders, among whom was one Conan Meriadec, a chieftain from the south of Scotland, to whom Maximus assigned the government of Armorica, which appears to have included the modern provinces of Brittany and western Normandy. This is the first recorded emigration of Britons into that province, which was followed by others, as Meriadec, having obtained the confirmation of his government from Theodosius, after the death of Maximus, induced many of his countrymen to come and settle under his protection.

In the middle of the fifth century, thousands of Britons, driven from their native country by the incursions of the Picts from the north, crossed the channel, and sought refuge among their countrymen in Armorica. That country, left unprotected by the Roman emperors, had erected itself into an independent state, under the government of Conan's descendants, and, favoured by its situation, had repelled the attacks of the northern tribes, who devastated

the rest of Gaul. The ships of Armorica carried on a considerable trade in those times, and the country seems to have attained a remarkable degree of prosperity amidst the general desolation of the west of Europe. The Christian religion was early propagated in Armorica; Bishops of Dol, Quimper, and Vannes, are recorded at the end of the fourth century, and the old annals of the country have preserved the memory of numerous saints, whose Celtic names are little known to the rest of the world.

Fresh emigrations continuing to pour in from Britain, the British population seems in a great measure to have displaced, near the coast at least, the original inhabitants, who withdrew to the interior districts; and from this circumstance the country began to be called Bretagne or Bretagne, and the people Bretons. The council of Tours, held in 567, in one of its canons makes a distinction between the Breton and the Roman inhabitants of Armorica. The successors of Conan were styled Counts of Bretagne. The French historians have said that they did homage to Clovis, king of the Franks, as their sovereign; but this appears doubtful. At all events, their vassalage must have been merely nominal, as we find them acting as independent princes, and frequently at war with Clovis's successors, until the country was finally subdued by Charlemagne. The name of Armorica had long before this event been superseded by that of Bretagne, under which name it again became a separate duchy, with only a nominal dependence on the crown of France. [See BRETAGNE; Daru, *Histoire de Bretagne*.]

ARMOUR is a term generally applicable to any defensive habit, used to protect the person of the wearer from the attack of an enemy. The English word for it in the aggregate, in the fifteenth and sixteenth centuries, was *harness*.

Among the more civilized antient nations, brass, iron, and other metals, were preferred for its fabrication; and in the time of Asiatic magnificence, even gold was not spared. Herodotus (vii. 71) says that the Libyans who assisted Xerxes in the great army wore leather armour, or probably skins only is meant; of which material, he adds (b. i. 71), the armour of the antient Persians also was composed.

But for the earliest memorials of armour we must look to the sacred writings, where we find the shield, the helmet, and the breast-plate used by the Israelites. Goliath of Gath (1 Sam. xvii. 6) wore greaves to defend the legs, which were also worn by the warriors of other Asiatic nations; and, at the siege of Troy, by the Grecians in general. Homer's epithet of *ἰσχυροὶς Ἀχαιοί* (the well-greaved Achæi) is familiar to every classical reader. His description of the thorax or breast-plate of Agamemnon, at the beginning of the eleventh book of the *Iliad*, shows that decorated armour was used at this early period. The same conclusion follows as a matter of course from the description of the shield of Achilles, and it proves that occasionally great pains and skill were employed in decorating armour. The golden armour of Glaucus (*Iliad*, vi. 236) is stated to be worth a hundred oxen. Among the Egyptians, armour of metal was confined to kings and nobles; the helmet of Psammetichus was of brass; the common soldiery wore quilted linen for helmets, and carried large wooden shields. (Xenophon, *Anab.* i. 8.) The breast-plate which Amasis sent to Athensæa (Minerva) at Lindos was made of linen, on which figures of animals were woven; the ornamental parts were of cotton-thread and gold. (Herod. iii. 47.) As to Greek armour, several specimens of the helmet and cuirass occur upon the frieze of the Elgin marbles; in one instance (slab 51) we have a scaled cuirass richly ornamented. In the bronzes of Siria, purchased from M. Bröndsted for the British Museum, the warriors have helmets and shields only. One has a round, the other an oval shield: their bodies are unclothed.

The complete Roman armour consisted of the helmet, shield, lorica, and greaves. The lorica was originally of leather, as we learn from Varro; in the time of Servius Tullius, according to Livy, the whole of the Roman body armour was of brass. The laminated lorica was heavy. Tacitus (*Hist.* lib. i.) informs us, that its weight was made a subject of complaint by some of the soldiers in the time of Galba; and the emperor himself, in his old age, found the weight of his cuirass too much for his feeble frame. (*Hist.* lib. i. c. 35.) The Roman lorica was frequently enriched on the abdomen with embossed figures, on the breast with a Gorgon's head by way of amulet, on the shoulder-plates with scrolls of thunderbolts, and on the leather border which covered the tops of the lambe-

quins (or pendent flaps) with lions' heads; and these were formed of the precious metals. Each Roman legion had its own device marked upon its shields. In the time of Trajan, as is exemplified in the armour represented upon his column, the lorica was shortened, being cut straight round above the hips. A bronze breast and back plate of this kind are preserved in the British Museum, upon the front of the former of which one of the paps of the breast still remains, like a high button, to which the shoulder-plates were fastened, which held the back and breast together.

From these facts a general notion will be gathered of the kind of body-armour used among the antient nations. But as to the minute varieties of it, which are to be found in statues, or upon gems, coins, vases, and other representations, exhibiting the differences and peculiarities which existed, according to the time, the country, or the progress of improvement among the people, the details would be endless. Some of the most important facts will be mentioned under the proper heads, such as SHIELD, HELMET, &c.

Upon the history of defensive armour, as it was worn in England, we shall be more minute. The early Britons are believed to have used none except the shield. Sir Samuel Meyrick, on the authority of Aneurin, the British bard, says, that the Anglo-Saxons under Hengist and others, wore many of them loricae of leather and four-cornered helmets. This armour, he thinks, was probably acquired through the alliance of their fathers with the Romans, under Carausius and his successors. Aneurin says that Hengist wore scale-armour. A very early illuminated manuscript in the Harleian Collection, No. 603, represents a warrior exactly answering this description. Drawings of the eighth century represent the Anglo-Saxon soldier without any other defensive armour than the shield and helmet, which latter, Sir Samuel Meyrick remarks, seems, in general, to have been nothing more than leather, and is often omitted even in representations of battles. His offensive arms are the sword and the spear. The form of the shield at this period is always oval; it is usually surrounded by a broad rim on the outside, and has a sharp boss projecting from the middle, both of metal; the materials were wood, covered with leather. One of the laws of Æthelstan prohibits the making of shields of sheep's-skin, under the penalty of thirty shillings. The helmet, as it is commonly represented in drawings of this æra, appears to have been nothing more than a cap of leather, with the fur turned outwards; but personages of rank had one of a conical form made of metal and gilt.

When the tunic supplanted the lorica, Sir Samuel Meyrick observes, the Roman pectoral was still retained, and called *haly-beaph* or *beoyn*, 'neck-guard'; *bneoyt-bebes*, 'defence for the breast'; and *bneoyt-pocc*, 'breast-plate.' It may be seen on a warrior in an illumination in a manuscript of the Cottonian Library, marked Tiberius, B. v., in which the resemblance to the Roman pectoral is quite manifest. The Saxon authors, he continues (*Crit. Inquiry into Ant. Armour*, Introd. p. lxiii.), are by no means explicit with respect to the form or materials of the breast-guards, but the epithet applied to such as were of metal is 'rigid.' Others are mentioned which are said to have been 'rough or shaggy,' so that we may suppose them to have been formed of wool or hair, or perhaps of undressed hides.

Notwithstanding these remarks, the word lorica frequently occurs in the writings of the most eminent Saxon authors, and sometimes is mentioned in terms which imply that it was made of metal. Aldhelm, who lived in the latter part of the seventh century, in some enigmatical lines (*Poet. nonnulla*, 12mo. Mogunt. 1601, p. 51, *De Lorica*), speaks of a warrior's vesture which feared not darts drawn from the long quivers:—

— En! vestis vulgi sermone vocabor:
Spicula non vereor longis exemptis pharetris.*

Whether this was the scaled-armour, such as worn by Hengist, or that made of flat-rings in the Phrygian style (as designated in Hope's *Costume*), is not quite clear. In an illumination, however, of the eighth century, a king habited in a tunic covered with flat rings occurs; and in another manuscript of that period similar armour occurs. (See the Cottonian MSS., Claud. B. iv., and Cleopatra, C. viii.) The Saxon authors call this *grehpynged byrn*, or 'rings byrne.' Some illuminations seem to show that the rings were worn edgewise, (compare the MS. Cleopatra, C. viii.), and in either case the name is equally applicable.

Towards the close of the ninth century, the *corum*

or corietum, was the armour generally used, and appears frequently in the drawings of that period. It was formed of hides cut into the resemblance of leaves, and covering one another; sometimes all of one colour, as blue, &c., and sometimes of two, as brown and orange; the upper part being of the one, while that which covers the thighs is of the other. It should be observed, that the Saxon byrnie, originally in shape like a tunic, became in form afterwards a complete cuirass, sitting close to the body, and generally terminating with it. Alcuin (*De Offic. Divin.*) speaks of the Anglo-Saxon military tunics of linen in the following terms. 'The soldiers are accustomed to wear linen tunics, so well fitted to their limbs as to enable them, with the utmost expedition, to direct the dart, poise the shield, wield the sword,' &c. The weight of the ringed byrnie seems to have been found a great impediment to activity. Hence, when Harold, in 1063, obtained immediate and decisive success over the Welsh, it was owing to the change of armour among his soldiers. He had observed that these mountaineers could not be pursued to their fastnesses by his troops when clad in ringed tunics, and he therefore commanded them to use their ancient leather suits, which would not impede their activity. (Ingulfus, fol. 68. Joh. Sarisb. *De Nugis Curialium*, lib. vi. c. vi. p. 185.)

The Saxon artists, it appears, made no distinction between the cunehelm, or royal helmet, and the crown. The monarch is depicted by them, in his court and in the field of battle, with the same kind of head-covering, even when every other part of his dress is marked with decisive variation; but upon the figure of Edward the Confessor, in his great seal, the diadem is evidently put on a helmet. The casque of the nobility is usually pointed in the form of a cone, and made of brass or some other metal. In the two succeeding centuries its shape is the same; but it is ornamented with gold and precious stones, and is improved by the addition of a small piece to protect the nose, called a nasal. (See an illumination in the Cottonian MS., Tiberius, B. v.)

Leg-guards are decidedly mentioned by the early Saxon writers; but they uniformly appear to have been made of twisted pieces of woollen cloth, coming from within the shoe, and wound round the legs to the top of the calves, in imitation of the hay-bands used by their rude ancestors.

The shield still continued oval, and indeed until the Norman conquest; but it differed from time to time greatly in dimensions, especially in the tenth and eleventh centuries, in the drawings of which times it appears of various sizes, from a magnitude sufficient to cover the head and body, to a diameter not greater than a foot and a half. This variation is further supported by historical testimony, for we find mention made of 'little shields,' and 'smaller shields.' In the will of Æthelstan, dated 1015, the shoulder-shield is included among the legacies, and it is distinguished from the target. It was probably of the larger sort, and received its appellation from being usually slung upon the shoulder.

When the Danes made their first appearance in England, Sir Samuel Meyrick says, they seem to have had no other armour than a broad collar, which encircled their chest and the lower part of their neck, or a small thorax of flat rings, with greaves, or rather shin-pieces, of stout leather. About Canute's time, the Anglo-Danes adopted a new species of armour, which, he thinks, they probably derived from their kinsmen, the Normans. This consisted of a tunic, with a hood for the head, and long sleeves, and what were afterwards called chausses, *i. e.* pantaloons, covering also the feet, all of which were coated with perforated lozenges of steel, called, from their resemblance to the meshes of a net, *maces*, or *mascles*. They wore, too, a helmet, or skullcap, in the shape of a curvilinear cone, having on its apex a round knob, under which were painted the rays of a star. This helmet had a large broad nasal, to protect the nose, and the hood was drawn up over the mouth, and attached to it, so that the only exposed parts were the eyes. The authority for these observations is the manuscript in the British Museum commonly called Canute's Prayer-book. Spears, swords, and battle-axes, or bipennes, were the offensive arms, and the shield remained as before.

Such had been the state of armour in Britain when William led his army of Normans and Flemings to the victory at Hastings.

From this period, the great seals of our kings, those of the greater barons, and monumental effigies, give the outline of the changes which took place in the fashions of

armour. The great seal of William the Conqueror represents him on one side seated on a throne, upon the other he is in a hauberk apparently of rings set edgewise, which kind of armour had been used by the Anglo-Saxons. The Norman body-armour represented in the Bayeux tapestry is of two kinds; one of rings or *mascles*, sewn flat on the vesture; the other of leather. The helmets are conical, and have the nasal. The ring-armour of the Bayeux tapestry forms both breeches and jacket at the same time: 'this,' says Sir Samuel Meyrick, 'I take to be the haubergeon, as there are some few specimens of the tunic or hauberk, and both being mentioned in the *Roman de Rou*. This opinion,' he adds, 'is further strengthened by a specimen of this curiously shaped armour existing on a monument in Ireland as late as the time of Edward III. It appears to have been put on by first drawing it on the thighs, where it sits wide, and then putting the arms into the sleeves, which hang loosely, reaching not much below the elbow, as was the case with the Saxon flat-ringed tunic: the hood attached to it was then brought up over the head, and the opening on the chest covered by a square piece, through which were passed straps, that fastened behind, hanging down with tasselled terminations, as did also the strap which drew the hood, or capuchon, as it was called, tight round the forehead. This is evident in several figures in the Bayeux tapestry; but the manner in which the armour was put on and fastened is best shown where William is arming Harold. The Duke of Normandy is there represented as placing the helmet on the head of the Saxon earl with his left hand, while his right is busied making tight a strap, which is drawn through the rings on the breast of the latter. No examples of such shaped armour in England occur previously or in any subsequent reign; but it appears to have been introduced into Ireland, and worn in that country, as has been above observed, as late as the time of Edward III.; nor does any distinguishing name seem to have been applied to it: hence I conclude that it is what Wace calls the haubergeon, in his description of the appearance at the battle of Hastings of Bishop Odo, the conqueror's half-brother.' The legs of the figures in the tapestry are, generally speaking, bound with bands of different colours, rising out of the shoe in the ancient Saxon manner; but, in some instances, and where the hauberk is worn, they appear covered with mail to the ankles. Such, however, is the case only with the most distinguished characters, as William, Odo, Eustace, &c. This covering for the legs, according to William of Malmesbury, was called *heuse* or *hose*; whence Robert of Normandy, being rather short-legged, we are told by Ordericus Vitalis, his contemporary, was often called by his father Curt-hose. The shield, as depicted in the tapestry, and introduced by the Normans, was of a very peculiar form. It has been called heater-shield and kite-shield by modern antiquaries, from its supposed resemblance to those familiar objects; but by the Normans themselves it was merely termed *escu*, from the Latin, *scutum*. While in the tapestry most of the Saxon shields are represented round or oval, with a central boss, as in the illuminations of that people, there is no instance of a Norman with any other than the long kite-shaped shield.

The armour of the reign of William Rufus remained precisely the same as in that of the Conqueror; and we have no new specimen of any part, except the *chapel de fer*. This appears on the seal of Rufus, and resembles a Tartar cap, being a cone which projects beyond the head.

The great seal of Henry I. represents that king in ringed-armour. Other specimens of his time occur in the enamelled copper of Geoffrey Plantagenet, engraved by Stothard, and described by John of Marmoustier, and in a representation of similar date, engraved by Strutt, in his *Dresses and Habits of the People of England*, from a manuscript in the possession of the late Francis Douce, Esq.

In the reign of Stephen, what is called tegulated armour appears to have prevailed, which consisted of several little plates, covering each other in the manner of tiles, and sewn upon a hauberk, without sleeves or hood. The seal of Richard Fitzhugh, Earl of Chester, engraved in the *Vetusta Monumenta* of the Society of Antiquaries, affords a fine specimen of this kind of hauberk. The nasal of the helmet appears to have been disused toward the close of this reign; though, upon his great seal, Stephen is represented with it.

Henry II. is represented upon his great seal in a flat-ringed hauberk, wearing a conical helmet without a nasal. The flat rings, however, gave way soon after the commence-

ment of his reign, and the hauberk with rings set edgewise came into general fashion. The shape of the shield became somewhat shortened, and often more angular on each side at the top.

Richard I., in his first seal, appears in a hauberk of rings set edgewise, from under which falls the drapery of his tunic; in the second seal he has the same without drapery; in both he is represented with chausses; in the first, wearing a conical helmet, but with its apex somewhat rounded; in the second, with a cylindrical one, surmounted by the *planta-genista* (or broom-plant) in reference to his name, and having an aventaille or plate to protect the face.

The great seal of John affords the first example of an English king wearing a surcoat; it is put over a hauberk of rings set edgewise. Surcoats are supposed to have originated with the Crusaders, for the purpose of distinguishing the many different nations serving under the banner of the cross, and to throw a veil over the iron armour, so apt to heat excessively when exposed to the direct rays of the sun. Besides the surcoat, the hauberk was a military garment in great esteem during this reign. Thus, in a wardrobe account dated in 1212, we find a pound of cotton was expended in stuffing an aketon belonging to King John, which cost twelve pence, and the quilting of the same was charged at twelve pence more. John is represented with a cylindrical helmet, but without any covering over his face. The monument in the Temple church ascribed to Geoffrey de Magnavilla, or Mandeville, which appears to be about this period, has one very similar, but with a nasal and cheek-pieces.

Henry III.'s great seals afford us the earliest specimens of the *ouvrages de pourpointerie*, which came more into fashion toward the latter part of his reign. His hauberk and chausses are of this padded work, stitched. On his first seal his helmet is represented as with the visor or aperture for sight, not in the aventaille, but in the helmet itself, while the latter has merely perforations for the breath, and is therefore fixed at the lower part. His second seal exhibits him in a cylindrical helmet of a more perfect form, the aventaille, which contains both the before-mentioned conveniences, being apparently made to open and shut by means of hinges and a clasp. This seal of Henry III. also represents him in a surcoat. A remarkable monumental effigy of a knight of this reign, in the armour of rings set edgewise, occurs in the church of Malvern in Worcestershire. The monumental figure of Richard Longespée, Earl of Salisbury, who died in 1224, is another specimen. 'The horse soldiers, at this time,' says Sir S. Meyrick, 'consisted of the heavy cavalry, who were the knights, and completely covered with mail, or, as Matthew Paris expresses it, *ad unguem armatos*, the face and left hand excepted.' In a manuscript, entitled *The Lives of the Offas*, written by Matthew Paris (MS. Cotton. Nero. D. i.), and of the time of Henry III., the knights appear generally in gamboused armour (padded work, stitched), with surcoats, and wearing shin-pieces or greaves of steel. One, however, is in a hauberk, with hood and chausses of flat contiguous rings, and probably this is the latest example of such armour being worn. Some appear with visors, consisting of a convex plate of steel, on which is a cross, with perforations for the sight, and punctures for the breath, tied upon the hood. Others have a nasal skullcap, though not the latest representation of this defence; and others the cylindrical helmet common to this period. The helmets of the kings are distinguished from the rest by a crown at top. They have all, too, those coverings for the knees called poleyns. This word is often erroneously confounded with poulaines, which were the long points at the toes of shoes, worn in Richard II.'s time, as well as anterior; but we learn from the following passage from Carolus Blessensis, in Lobineau's *Hist. Bretagne*, vol. ii. p. 566, that they were for the knees: '*Fecit sibi per Oliverium auferri à genibus polenas, et antebrachia à brachiis*.' He caused Oliver to take the poleyns from his knees, and the vambraces from his arms. Pourpointing, or elaborate stitching, it appears, became at this time a trade, and there were several pourpointers in Paris and London. The use of the pourpoint seems greatly to have gained ground, and the military in the delineations of this and the next reign are almost constantly depicted in it. Sir Samuel Meyrick says, 'it has been observed, that in the illuminations of this period, the archers are represented wearing leathern vests over their hauberks of edge-ringed mail. These appear to have been the jack in its primary form, which originated with the English, and which afterwards

assumed a shape so cumbersome. From the *Chronicle of Bertrand du Guesclin*, composed about the time of Richard II., we learn that it continued to be worn over the hauberk, for he says, '*S'avoit chascun un jacque par dessus son haubert*,'—each had a jack above his hauberk. This small vest was called jacket, and in the Latin of the time, *jaquetanus*, as was the *jacque*, *jacquemardus* and *jacobus*. The monument of Eudo de Arsic, who died about the latter part of this reign, seems to represent him in the jacque. He is clad in mail, and wears this garment, which is made with sleeves, sits close to the body, is buttoned down the front, and has a puckered skirt reaching to the knees. In later times it was generally of leather, for Coquillart, an old French writer, '*sur les Droits nouveaux*,' describes it as of chamois, extending to the knees, and stuffed with flocks, so as to be a kind of pourpoint. During the latter part of this reign, the shape of the helmet underwent a partial change, taking the form of a truncated cone on the top of a cylinder: the apertures for the sight were horizontal, and pierced in the transverse part of a cross that ornamented the front. The crusade in this reign, says Sir Samuel Meyrick, seems to have introduced a new and most ingenious species of armour, probably of Asiatic discovery, and still worn by those nations at the present day. This was the interlaced rings, which, as dependent on each other, did not require to be sewn to an under garment. The earliest specimen he considers to be the monumental effigy of De l'Isle, in Rampton church, Cambridgeshire, which exhibits him in the flat coif worn during the greater part of this reign, but made, as well as his hauberk and chausses, of interlaced chain. The shape of his shield, however, is that of the close of Henry III.'s reign, and, with his surcoat, is ornamented with his armorial bearings. The *chapel de fer* continued to be used in this reign. The chanfron, or armour for the horse's head and face, first occurs in the clause-roll of the fifty-fourth Henry III.

Considerable improvements were made in armour during the reigns of the first three Edwards. Ailettes, or shoulder pieces, appear to have been introduced in that of Edward I. In Edward II.'s time, armour appears to have assumed a mixed character, being neither altogether mail nor wholly plate. *Armures de fer*, toward the close of this reign, became the distinctive term, among the French writers, for plate-armour. The Florentine annals, says Sir Samuel Meyrick, consider the year 1315 as remarkable for a new regulation in armour, by which every horseman who went to battle was to have his helmet, breastplate, gauntlets, cuisses, and jambes all of iron, a precaution which was taken on account of the disadvantages their cavalry had suffered from wearing light armour at the battle of Catinò; but this usage did not find its way into general practice in Europe for at least ten years after. The seal of Edward Prince of Wales, afterwards King Edward III., represents him with ailettes on which are his arms, in the same manner as Edmund Crouchback is exhibited in Westminster Abbey, and in a missal belonging to the late Francis Douce, Esq. What is curious in this is the early representation of the mame-lieres, or pieces put on the breast, from which depended chains, one of which was attached to the sword-hilt, and the other to the scabbard. The armour at the close of this reign may be seen in an initial letter of a grant from King Edward II., constituting his brother, Thomas de Brotherton, Marshal of England. (See the MS. in the Cottonian Library, Nero, D. vi.) In the chancel of Ash church, in Kent, is the monumental effigy of a knight which exhibits still further the progress toward plate-armour.

The helmet on the seal of Edward II. is of a cylindrical form, with a grated or pierced aventaille and visor attached: a clasp which fastens this on the right side is very visible and it is probable that on the other it was retained by hinges. It was very much the custom during this reign to wear over the armour the cointisse, or surcoat, ornamented with the warrior's arms.

The monumental effigy of John of Eltham, who died in 1329, exhibits the fashion in which armour was worn at the commencement of the reign of Edward III.; similar to which is the figure on the monument of a knight in Ildeld church, in Sussex. The splendid manner, it is observed, in which some of the knights of this period chose to have their armour made proved sometimes fatal to them. Froissart tells us, that 'Raymond, nephew to Pope Clement, was taken prisoner, but was afterwards put to death for his beautiful armour.' The monument of Sir Oliver Ingham,

at Ingham church, in Norfolk, who died in 1343, shows the further gradual progress of mixed armour. His monument also affords us one of the earliest specimens of the justing helmet of this time, surmounted by its crest—an owl with wings expanded. The equestrian statue of Bernabo Visconti, at Milan, engraved in the *Archæologia*, vol. xviii. pl. xii. xiii. xiv. with its details, affords a magnificent specimen of the mixed armour used at this time upon the continent. Moveable visors attached to the bacinets (or skull-caps in the form of a bason) appear to have come in about the middle of the reign of Edward III. The Black Prince's monument at Canterbury, who died in 1360, is another specimen of the period. The monument of Humphry de Bohun, Earl of Hereford, in 1367, Sir Samuel Meyrick observes, is the earliest specimen of plate-armour with taces, or overlapping plates to envelope the abdomen, at the bottom of the breastplate, without any surcoat. It was not till the reign of Henry V. that this practice became general. Humphrey de Bohun wears plate over the insteps, but the rest of his feet is covered with chain.

The reigns of Richard II. and Henry IV. were still more distinguished by the increased ornament of armour. The armourers of Italy were much employed at this time by the English nobility. When Henry, Earl of Derby, proposed the combat with the Duke of Norfolk at Coventry, he sent to Galeazzo, Duke of Milan, for armour, who gave the knight who bore Henry's message not only the choice of all his armour, but sent with him to England four of the best armourers of Milan to give personal attendance upon Henry for his equipment. Chaucer, noticing a tournament at this period, says,

Ther mayst thou see devising of harness
So unouth and so riche, and wrought so well
Of goldsmithry, of brouding, and of stele;
The sheldes brighte, testeres, and trappures;
Gold-hewen helmes, hauberkes, cote-armures.—v. 2498.

Soon after the year 1400, chain-mail seems to have been entirely disused; and the complete armour of plate adopted. Henry V. is so represented on his great seal, as well as in one of the illuminations of the celebrated Bedford Missal; in the latter he is represented being armed by one of his esquires. Black armour was at this period often used for mourning. Henry IV. is constantly represented in black armour in the illuminations to the celebrated manuscript on *The Deposition of Richard II.*, preserved in the Harleian Collection.

A more splendid specimen of armour of the reign of Henry VI., than that represented on the effigy of Richard Beauchamp, Earl of Warwick, in the Beauchamp Chapel at Warwick, will not be found anywhere; he died in 1439.

The fashion of armour prevalent through the reign of Edward IV. may be judged of from that monarch's great seal, and from the monumental effigy of Sir John Crosby, in the church of St. Helen, without Bishopsgate, in London. The latter died in 1475. Soon after this time, numerous specimens of armour occur with immense elbow-plates; these continued till the time of Henry VIII.

The perfection of plate armour is supposed to have been attained in the reign of Richard III.

A fine and singular suit of armour, which undoubtedly belonged to King Henry VII., is still preserved in the Tower of London, and is considered the greatest curiosity in that collection; it is accompanied by a chanfron, manefaire, and poitral of the same period, for arming the horse.

Fluted armour was sometimes used in the reign of Henry VII.; this fashion is supposed to have come from Germany.

Drawings of various military figures of the middle of King Henry VIII.'s reign, made at the time, occur in the Cottonian manuscript in the British Museum marked Augustus II., and amongst them Henry himself in armour. A great deal of the armour of this period had devices, arms, &c. stamped or engraved upon it; and some was *damasquinée*, or inlaid with gold.

In the reign of Edward VI. a slight change took place in the form of the breast-plate, which was again a little changed in the reign of Mary. During Elizabeth's reign, no great alteration took place. 'But armour *cap-à-pie*,' says Sir Samuel Meyrick, 'began to fall into disrepute soon after the accession of King James I., and, in the latter part of his reign, the jamba or steel coverings for the legs were almost wholly laid aside.' At Strawberry Hill, there is a suit of armour said to have belonged to Francis I. of France, which Sir Samuel Meyrick ascribes to the reign of James. It is embossed and gilt, and is considered to be probably

one of the latest specimens of armour with raised figures upon it.

King Charles I. is continually represented in armour; and he took great pains to bring about a uniformity in the fashion of armour among his officers and soldiers. But the troubles of his reign, and the success of the levellers of that period, caused a material alteration, so that soon after the establishment of the Protectorate we find the helmet and cuirass only worn; the latter consisting of a breast and back plate. The wearing of armour to the knees continued only to the time of Cromwell. The cuirass and a kind of helmet, however, are still retained amongst us for the royal regiments of Life Guards; and have, likewise, been resumed in the armies both of the French and Germans.

For this account of armour, various works have been consulted—Grose's *Treatise*; Gough's *Sepulchral Monuments* &c.; but the chief outline has been taken from Sir Samuel Meyrick's *Critical Inquiry into Antient Armour as it existed in Europe, but particularly in England, from the Norman Conquest to the Reign of Charles II.* The collection of antient armour possessed by that gentleman's son at Goodrich Court, in Herefordshire, and his own extensive researches, have supplied more information upon the subject than it is probable could have been given by any other writer.

The reader who wishes for further information may consult Sir Samuel Meyrick's *Engraved Illustrations of Antient Armour from the Collection at Goodrich Court*, 2 vols. fol. Oxford, 1830, where (pl. iv. to x.) a series of tournament armour of successive dates, from 1458 to 1586, is exhibited.

Bordeaux steel is frequently mentioned by Froissart as excellent for armour. Felippo Negrolì, of Milan, was the eminent armourer who worked for Francis I. of France, and the Emperor Charles V.

Some remarks on the antient mode of putting on armour, communicated to the Society of Antiquaries by Sir Samuel Meyrick in 1821 (see the *Archæologia*, vol. xx.), unravel, by the help of an antient document, what was previously an enigma. The knight began with his feet and clothed upwards: viz. 1. his sabatynes, or steel clogs; 2. the greaves, or shin-pieces; 3. the cuisses, or thigh-pieces; 4. the breech of mail; 5. the tuiettes, or overlapping pieces below the waist; 6. the breast-plate, or cuirass; 7. the vambraces or covers for the arms; 8. the rere-braces, or arrière-bras, the covering for the remaining part of the arm to the shoulder; 9. the gauntlets; 10. then the dagger was hung; 11. the short sword; 12. the cloak, or coat, which was worn over the armour; 13. the bacinet; 14. the long sword; 15. the pennoncel, held in the left hand; 16. the shield.

ARMS, in a general sense, includes all kinds of weapons, whether of offence or defence. Among the earliest, we may probably reckon the bow and arrow. It enabled man to kill wild animals for food before its use was required as a weapon of war. As a military weapon, it was probably succeeded by the sling. Lucretius says,—

'Arma antiqua, manus, ungues, dentesque fuere,' &c.

Man's earliest arms were fingers, teeth, and nails,
And stones, and fragments from the branching woods.
Then fires and flames they joined, detected soon;
Then copper next; and last, as latest traced,
The tyrant iron, than the copper vein
Less freely found, and sturdier to subdue.'

Homer and Hesiod tell us, that, in the early ages, the arms and instruments of the heroes were composed entirely of χαλκός (*copper*), perhaps hardened with tin. The word is commonly translated *brass*, but it could hardly have been the compound metal which we understand by brass. Defensive arms have been already treated of under ARMOUR. The present article is confined chiefly to weapons of offence.

The Jews appear to have had swords, daggers, spears, javelins, bows, arrows, and slings: axes or maces were also used by them as weapons of war.

Herodotus (vii. 61-80) gives a minute description of the weapons used by most of the different nations which formed the great army of Xerxes. Amongst these, the Medes and Persians had short spears, bows, arrows made of reeds, and daggers; the Assyrians, besides spears and daggers, had wooden clubs knotted with iron; the Bactrians and Parthians, bows made of reeds, and short spears; the Arabians had bows, large, flexible, and curved at the ends; the Æthiopians, bows made from the spath (*σπαθῆ*) of the palm, four cubits, or six feet, long; their arrows were short, and pointed with sharp stones instead of iron; they had spears headed

with the sharpened horns of the *dorcas* [See ANTELOPE, p. 70], and knotted clubs. The Libyans had their spears hardened at the end by fire. The Paphlagonians, Phrygians, and Thracians, had spears, javelins, and daggers. In the Persian army at the battle of Cunaxa, we find chariots armed with scythes mentioned. (Xenophon, *Anab.* I. 8.)

The Grecian armies were composed of various sorts of soldiery. In the earliest ages, as we see from Homer, the chief personages often fought in chariots; but this practice seems not to have existed in the historical ages. The cavalry of Thessaly and that of Macedonia obtained the highest reputation among the Greeks. It was with this cavalry that Alexander mainly defeated both the troops of the Persian king and those of the rulers of the Penj-ab. With the age of Alexander elephants were brought into use, and they were employed both by Pyrrhus the Greek King of Epirus, and by Hannibal also, in their invasions of Italy. The Greek foot soldiers were distinguished by the terms *ὁπλίται* (*hoplitai*), those who wore armour, and carried broad shields and long spears; and *ψιλοί* (*psiloi*), the light troops, who, with no other protection than a helmet, were armed with darts, bows and arrows, or slings. The *πτελάται* (*peltastai*), who carried the peltæ, or narrow-pointed shields, and spears, were a species of light troops, and considered as an intermediate kind. The heavy-armed foot were the chief strength of the Grecian armies.

The Greek spears were generally of ash, with a leaf-shaped head of metal, and furnished with a pointed ferrule at the butt, with which they were stuck into the ground. Pausanias saw a spear in the temple of Minerva at Phaselis, said, according to the legend, to have belonged to Achilles, the blade and ferrule of which were of copper. The same diligent and credulous observer saw a knife at Nicomedia, altogether made of copper, which once belonged to Memnon; that is, it was a very old knife, kept as a curious piece of antiquity. The Macedonians had a particularly long spear called *σάρισα* (*sarissa*), which was fourteen or sixteen cubits in length. (See Polybius for this extraordinary length, and the notes to the *Onomasticon* of Julius Pollux, v. *σάρισα*.)

Swords, spears, javelins, bows, and slings, were the offensive arms of the Romans, whose infantry soldiers were divided into *hastati*, who fought with spears; *principes*, who led the van; *triarii*, the third line; *velites*, the light troops; *funditores*, the slingers; and *sagittarii*, the archers. Their cavalry used the javelin on horseback. The arrows of the *sagittarii* had not only their pikes barbed, but were furnished with little hooks just above, which easily entered the flesh, but tore it when an attempt was made to draw them out. What greatly contributed to render the Romans masters of the world, was, that as they successively fought against all nations, they renounced their own arms and methods of fighting wherever they met with better. Romulus, after the war with the Sabines, is said by Plutarch (Romulus, 21) to have adopted the broad buckler of that nation, instead of the Argolic buckler (*aspis Argolica*), which the Romans had used till that time: a story of little historical value, but confirmatory of the opinion that the Romans improved their military art by adopting the best things from other nations, and that they traced this policy to the supposed origin of their national existence.

The early Saxons, previous to their arrival in Britain, besides the buckler and dagger, used a sword bent in the manner of a scythe; but their descendants soon changed it for one that was long, straight, and broad, double-edged, and pointed. The ordinary weapons of the Saxons, after their arrival in our island, for the infantry, were spears, axes, bows and arrows, clubs, and swords. Few of the infantry had any other defensive armour than small round shields with spikes in the centre. The cavalry were more uniformly armed with long spears which they carried in their right hands, and swords which hung by a belt on their left sides.

The arms of the Normans differed but little from those of the Saxons; their spears or lances were usually made of some light strong wood, pointed with steel, very sharp, and well-tempered; to these, with the sword and dirk, they added the cross-bow, as has been already shown in the article ARCHERY. The Normans also appear to have introduced a kind of field-artillery, consisting of instruments or machines from which darts and stones were thrown to a considerable distance: to which, also, they added arrows headed with combustible matter for firing towns and shipping.

Our military weapons were probably but little altered till the time of Edward I., when the English long-bow seems to have been adopted, or rather arrived at its proper use.

Gunpowder was invented in the thirteenth, and the larger sort of fire-arms in the fourteenth century: these will be separately treated of under the head of ARTILLERY.

Portable or hand fire-arms, to which we shall confine ourselves at present, were not invented till a century later. Sir Samuel Meyrick, in a Memoir in the *Archæologia* of the Society of Antiquaries, has collected most of the scattered notices to be found in military writers relating to their introduction. He has, indeed, given the very year of their invention, upon the authority of an eye-witness. 'It was in 1430,' says Bilius, 'that they were contrived by the Lucquese when besieged by the Florentines;' and we shall find that not only is the credit of the first conception of these weapons due to the Italians, but most of the subsequent improvements.

A French translation of Quintus Curtius, written in 1468, preserved among the Burney MSS. in the British Museum, exhibits two warriors in one of its illuminations, who bear the earliest representations of hand fire-arms with which we are acquainted: they appear to be hand-guns.

The following is the enumeration of the different pieces or portable fire-arms and their accompaniments, almost all of which have been engraved by Skelton, in his *Specimens of Arms and Armour*. Hand-cannon, hand-gun, arquebus, arquebus à croc, haquebut, demi-haque, musquet, wheel-lock, currier, snaphaunce, caliver, carbine, escopette, fusil, musquetoon, fowling-piece, petronel, blunderbus, dragon, hand-mortar, dag, pistol, tricker-lock, fire-lock, self-loading gun, fancy-gun, musket-arrows, match-box, powder-horn and flask, touch-box, bandeleers, cartridges, patron, sweynes-feathers, and hayonet. The recollection of the fact, that *phialæ* (small pots) had been sometimes used for casting the Greek fire, was likely to lead to some more dexterous invention. The Emperor Leo, in his *Tactics*, ch. xix. § 6, *περί ναυμαχίας, on sea-fight*, describing the use made of artificial fires in vessels employed in pursuit after a naval battle, says, 'on the prows of such vessels were placed *σείφωνες* (*siphones*), large tubes; they were of copper, through which these fires were blown into the enemies' ships.' Anna Comnena (*Alex.* I. xiii.) says, 'that soldiers were supplied with copper tubes, and blew artificial fire, in the same way, upon their enemies in battles on land.' Here we have, undoubtedly, the origin of fire-arms.

The *hand-cannon* was a simple tube fixed on a straight stock of wood, about three feet in length. It was furnished with touch-hole, trunnions, and cascade, like a large cannon. The touch-hole was, in the first instance, at top; but the liability of the priming to be blown away led to the improvement of placing a small pan under the right side to hold the powder. This pan was the first step to the invention of the gun-lock.

The *hand-gun* was an improvement on the hand-cannon. It was cast in brass, and, as a tube, was of greater length; a flat piece of brass, made to turn upon a pin, covered the pan which contained the powder: it had also the addition

of a piece of brass fixed on the breech, and perforated to ensure the aim. The hand-gun appears to have been in use in England at least as early as 1446. The Greeks made use of it to great advantage in their last defence of Constantinople in 1453.

As soon as the hand-gun had received a contrivance suggested by the trigger of the cross-bow, to convey with certainty and instantaneous motion the burning match to the pan, it acquired the appellation of *arquebus*, corrupted into *harquebus*. Previous to this invention, the match had been held in the hand in using the hand-gun as well as the hand-cannon. The *arquebus* is first mentioned by Philip de Comines, in his *Account of the Battle of Morat* in 1476. In England, on the first formation of the Yeoman of the Guard in 1485, one-half were armed with bows and arrows, the other with *arquebuses*. At the battle of Fournoe, in 1495, we read of mounted *arquebusiers*. A large party of *arquebusiers* are seen in the picture at Windsor which represents King Henry VIII.'s procession to meet Francis I., between Guisnes and Ardres. The *arquebus*, like the hand-cannon and hand-gun, being fired from the chest, while its butt remained straight, the eye could with difficulty only be brought sufficiently near to the barrel to afford a perfect aim. By giving to the butt a hooked form, the barrel was elevated, while the horizontal position would be retained. This idea originating with the Germans, gave name to the fire-arms thus constructed, and was thence by the English termed a *haquebut*, *hakebut*, *hagbut*, or *hagbush*. The invention as well as the name was known in England as early as the reign of Richard III. We find numerous *haquebutters* in the English army in the time of Henry VIII.

The *demihauque* was a kind of long pistol, the butt-end of which was made to curve so as almost to become a semi-circle. The *demihauques* were smaller, and probably about half the weight of the *haquebuts*, the diameter of the barrel being much less. In the *Gesta Grayorum*, printed in 1594, we are told they carried bullets, and sometimes half shots.

The *musquet* was a Spanish invention. It is said to have first made its appearance at the battle of Pavia, and to have contributed in an especial manner to decide the fortune of the day. Its use, however, seems for a while to have been confined. It appears not to have been generally adopted till the duke of Alba took upon himself the government of the Netherlands in 1567. M. de Strozzi, Colonel-General of the French infantry under Charles IX., introduced it into France. The first Spanish *musquets* had straight stocks; the French, curved ones. Their form was that of the *haquebut*, but so long and heavy, that something of support was required; and hence originated the *rest*, a staff the height of a man's shoulder, with a kind of fork of iron at the top to receive the *musquet*, and a ferule at bottom to steady it in the ground. On a march, when the piece was shouldered, the *rest* was at first carried in the right hand, and subsequently hung upon the wrist by means of a loop tied under its head. A similar *rest* had been first used by the mounted *arquebusiers*. In the time of Elizabeth, and long after, the English *musqueteer* was a most encumbered soldier. He had, besides the unwieldy weapon itself, his coarse powder for loading, in a flask; his fine powder for priming, in a touch-box; his bullets in a leathern bag, the strings of which he had to draw to get at them; while in his hand was his burning match and his *musquet rest*; and when he had discharged his piece, he had to draw his sword in order to defend himself. Hence it became a question for a long time, even among military men, whether the bow did not deserve a preference over the *musquet*.

An ingenious contrivance to supplant the match-lock appeared in the reign of Henry VIII. This was the *wheel-lock*, invented in Italy. M. de Bellai informs us, that one of the first occasions on which it was used was in 1521, when Pope Leo X. and the Emperor Charles V. confederated against France, and their troops laid siege to Parma, which was defended by the Marquis de Foix. It was a small machine for exciting sparks of fire by the friction of a furrowed wheel of steel against a piece of sulphuret of iron, which, from such application, acquired the name of pyrites or fire-stone. The spring which turned this wheel was attached to it by a chain, formed like those in watches, and was wound upon the axle, or, as the term was, 'spanned' with a small lever called a spanner. This instrument had at one end a hole made square to correspond with the projecting axle of the wheel, and being adjusted, was moved in the

direction of a screw, which made the wheel revolve, and a little slider that covered the pan retire from over it. The spanner was then removed, as the wheel was held by a catch connected with the trigger, and the cock, like that in modern firelocks, except having its position reversed, containing the pyrites, was brought down upon the wheel, which, rapidly revolving, grated against the pyrites and elicited the fire. Wheel-locks were for a long time chiefly manufactured in Germany. They were certainly brought to England in the time of Henry VIII., in whose reign we find them mentioned in inventories under the name of 'fier-locke.' Benvenuto Cellini (*Memoirs*, vol. i. p. 182, Roscoe's transl.) mentions his mounting a brown Turkish horse, and placing a wheel lock *arquebus* at the pommel of the saddle, in the year 1530.

The *Currier*, or *currier of war*, is another species of fire-arm first noticed in a letter from Lord Wentworth to Queen Mary (see the *Hardwick State Papers*), while writing respecting the siege of Calais. It is again noticed in the Earl of Essex's operations in Ireland in the time of Queen Elizabeth. (Birch's *Memoirs*.) The earliest account of it is given in a work entitled *The Knowledge and Conduct of Warres*, printed in 1578. Sir John Smith, in his *Animadversions on the Writings of Captain Barwick*, describes it as of the same calibre and strength as the *arquebus*, but with a longer barrel.

Grose observes, that the *Snaphaunce* derived its name from the troops who made use of it. These were a set of marauders whom the Dutch termed *snaphans* or 'poultry stealers.' The use of the match-lock exposed them to this inconvenience, that the light from the burning match pointed out their position, and they were unable to purchase the wheel-lock from its expense. In this dilemma they formed the *snaphaunce* from a study of the wheel-lock. A flat piece of steel, furrowed in imitation of the wheel, was placed on a steel post, which, being screwed beyond the pan, was made moveable. Then the furrowed piece being brought to stand over it, on pulling the trigger, the flint, which they substituted for the pyrites in the cock, struck against it, and the spark was produced. This was an invention of the time of Elizabeth, and its comparative cheapness rendered it fashionable in France, Holland, and England. The *snaphaunce* was a near approach to the fire-lock.

The *Caliver* differed from the *musquet* in being lighter and shorter. It was a fire-arm of a regulated standard as to the diameter of its bore, which was larger than that of the *arquebus*. It was made to fire with a match-lock. A match-lock caliver is preserved at Brancepeth Castle, Durham, which bears the date of 1611.

Of the *Carabine*, Sir Samuel Meyrick says, 'In the extraordinary for the war in Picardie, in 1559, we first meet with the troops called carabins, who were light cavalry in the service of Henry II., King of France.' M. de Montgomeri informs us, that 'they wore a cuirass sloped off the right shoulder, that they might the more readily couch their cheeks to take aim; that they had a cabasset on their heads, and their bridle-arms protected by an elbow-gauntlet. Their offensive weapons were a carabine three feet and a half in length, so named from themselves, and a pistol. Their manner of fighting was, to form a little squadron, deeper than wide, to discharge their pieces rank after rank, wheeling off, and forming immediately and successively in the rear of the rest, and thus prepare for a second discharge.' Now, although the origin of the word is involved in much obscurity, it is more consistent with analogy to suppose that the carabineers were so named from the gun, rather than that from them. The French derived this species of troops from the Spaniards; and Duetail tells us that the Calabrians, who used the carbine, gave it this appellation. If so, it was probably at first used by them at sea in those vessels termed carabs. M. Bellon, in *Les Principes de l'Art Militaire*, tells us, that 'the carabines were armed with a large wheel lock *arquebus*, three feet or more in length, a sword, and a short pistol, in the time of Louis XIII., but being suppressed by his successor in 1665, we know that that king formed from them his carabineers.'

The *Esclopette*. The peculiar characteristics of this fire-arm, says Sir Samuel Meyrick, 'I have not been able to discover. It was called in Latin *sclopeta*, a diminutive of *sclopus*; and occurs in the *Chronicon Estense* under the year 1534, as well as in the decree of the Council of Tarragona in 1591, who forbade the clergy to make use of it. Probably it was only the foreign name of the *demihauque*.'

'The name of the *Fusil* as a fire-arm, in England,' says the same authority, 'does not appear to be older than the time of Charles II., though invented in France in the year 1630.' There are in the British service three regiments of fusiliers or fusileers, the Scots, now the 21st foot, raised in 1678; the English, now the 7th foot, levied in 1685; and the Welsh, now the 23d, formed in 1688 or 1689. The *Sieur de Gaya*, in 1688 (*Traité des Armes*), describes it as of the same proportions as the 'mousquet,' and furnished with a fire-lock; adding, that 'although by couching the cheek you can take better aim, yet it often misses fire from the use of the flint.' It seems to have been of the same length and calibre, but lighter than the musket. In modern times its size has been diminished.

The *Mousquetoon*, or musketoon, was also of French origin. The same author describes it, in 1688, as not so long as the fusil, nor capable of carrying a ball so far by one-third, its barrel not rifled, but differing from the carbine in being furnished with a fire-lock instead of a wheel-lock, and from the carbine à l'*extraordinaire* not only in this, but in its fluted bore.

The *Fowling-piece*, though properly speaking a fabrication for the sole purpose of killing game, is entitled to a place in the history of military weapons from the circumstance of the Earl of Albemarle noticing it for the soldiers' use, in his 'Observations,' compiled about the year 1646, and published in 1671. He says, 'It is very fit likewise that you have in each company six good fowling pieces, of such a length as a soldier may well be able to take aim, and to shoot off at ease; twelve of them being placed in a day of battle, when you bring a division of foot to skirmish with an enemy, on the flanks of a division of foot, and six on the other flank, as you shall see them placed in these three battals following. Those soldiers that carry the fowling pieces ought to have command when they come within distance of shot of that division of the enemy that they are to encounter with, that they shoot not at any but at the officers of that division.' We have here plainly the origin of riflemen.

The President Fauchet, who lived in the time of Francis I., and that of his successors till the time of Henry IV., introduces to our notice a piece called a *Petronel* or *poitrinel*, because it was rested on the pitrine or chest, after the old manner, and thence fired. It was the medium between the arquebus and the pistol, and differed from the long dag merely in having its butt made broader, so as to rest in its position with proper firmness. Fauchet says, it was believed 'that this arm was the invention of the bandouliers of the Pyrenean mountains.' Mention is made of it in 1592, at the siege of Rouen by Henry IV., and in the Hengrave Inventory of 1603 we have 'Item iij pethernels.' Nicot, in his dictionary, asserts that 'it was of large calibre, and, on account of its weight, carried in a broad baudrick over the shoulder.'

The *Blunderbus*. This is a fire-arm shorter than the carbine, but with a wide barrel. Sir James Turner, in his *Pallas armata*, p. 137, thus describes it: 'The carabineers carry their carabines in bandileers of leather about their neck, a far easier way than long ago, when they hung them at their saddles: some, instead of carabines, carry blunderbusses, which are short hand-guns of a great bore, wherein they may put several pistol or carbine balls, or small slugs of iron. I do believe the word is corrupted, for I guess it is a German term, and should be donderbucks, and that is, thundering guns, donder signifying thunder, and bucks a gun.' Sir Samuel Meyrick remarks that Sir James Turner is right in his etymology, except that 'bus' and not 'bucks' is the term for a gun, a name that became general after its introduction in the word arquebus: the modern German word is *büchse*. Blunderbus being called in the Dutch language *donderbus*, in all probability it was from Holland that the English derived it: it does not appear to have been much known before the time of Charles II.

The *Dragon*. The troops called dragoons have been most absurdly said to have been so denominated from the *Draconarii* of the Romans. They were raised about the year 1600 by the Mareschal de Brisac, in order to be superior to the German Reiters, who used the pistol to so much advantage. On this account they had a more formidable weapon like a small blunderbus, the muzzle of which being ornamented with the head of a dragon, gave it its denomination, and from this weapon those who used it were called dragooners and dragoons. Other, but less satisfactory, ex-

planations of the term dragoon (with no reference to the fire-arm called a dragon) will be found in Sir James Turner's *Pallas armata*, in Pere Daniel's *Milice Française*, and in Count Bismark. The dragon will be found among Skelton's engraved *Illustrations*.

The *Hand-mortar*. Grenades are said to have been first used in 1594, and gave origin at a later date to the troops thence denominated grenadiers. Like the dragon it appears to have been fired from the shoulder.

The *Dag*. In pursuing the inquiry into the origin of this term, says Sir Samuel Meyrick, nothing could be more perplexing than to find, that while dag implied a kind of pistol pistolese, in the Italian language, signified a great dagger or wood-knife. The weapon appears to have been suggested by the demihaque, and differs from the pistol solely in the form of the butt end, that being invariably terminated by a straight oblique line instead of a knob. In this respect it greatly resembled a petronel, and that it gave the distinction is clear, from what is wrongly called a Highland pistol being by the Highlanders themselves termed a tack, and its having its butt made flat and terminated slant-wise. The dag was of various sizes, and hence in inventories of arms we meet with long, short, and pocket dags, and dags with different kinds of locks. It appears to have been almost coeval with the pistol, which is known to have been invented in the reign of Henry VIII.; for in the inventory, taken in 1547, of stores in the different arsenals in England, 'one dag with two pieces in one stock' occurs, with 'a white tacke with fier locke graver, and all the stocke white bone; two tackes, after the fashion of a dagger, with fier lockes vernished with redde stockes, shethes covered with blacke vellet garnished with silver and guilt, with purses, flasks, and touch boxes of black vellet garnished with iron guilt; two tackes hafted like a kniff with fier lockes and double lockes, &c.' The snaphaunce dag seems to be alluded to in the play of Jack Drum's entertainment:

He would shew one how to hold the dag,
To draw the cock, to charge and set the flint.'

The *Pistol*, according to Sir James Turner, was invented at Pistoia, in Tuscany, by Camillo Vitelli, and in the reign of Henry VIII. M. de la Noue says, 'the reiters first brought pistols into general use, which are very dangerous when properly managed.' These reiters, or more properly ritters, were the German cavalry, who gave such ascendancy to the pistol as to occasion in France, and subsequently in England, the disuse of lances. We learn this interesting fact from Davila, who, speaking of the battle of Ivry, in 1590, takes occasion to extol the use of lances, and express his regret that the French cavalry, composed of gentlemen volunteers, had, in the revolutions of the civil wars, ceased to use them. He tells us, that in consequence of their having adopted pistols as more ready, in imitation of the German reiters, the king was obliged to oppose the lances of the enemy's cavalry by dividing his own into small bodies, that they might offer less resistance to the charge, and more easily get out of the way. Pere Daniel informs us, that the horsemen who were armed with pistols, in the time of Henry II., were thence called pistoliers, a term subsequently introduced into England. John Bingham, in his *Notes on the Tactics of Ælian*, published in 1616, gives us an engraving of the arms and armour of this species of troops at that time, from which a correct knowledge may be obtained of their form. The first ordonnance of Henry II., King of France, respecting the pistol, is directed to the men at arms, and dated 1549; the regulations of Mary Queen of England were of a similar character; both implying that the adoption of the pistol, in the first instance, was by permission. The manual exercise of this weapon is detailed and exhibited in several plates in Captain Cruso's *Military Instructions for Cavalry*, published in 1632. Sir James Turner, in his *Pallas armata*, published in 1670, says, the French then used locks with half-bends (snaphaunces), as well as for the most part the English and Scots; the Germans rose or wheel-locks; the Hollanders used both.

The *Trickerlock*. 'A match tricker-lock compleat' occurs in a schedule of the year 1629. This was the adoption of what is now termed a hair-trigger, which was added to the former one, and gives a more instantaneous discharge. A tricker wheel-lock of the reign of Charles I., a tricker match-lock of that of Charles II., and a tricker fire-lock of that of James II., upon this principle, are preserved in Mr.

Meyrick's collection of arms and armour at Goodrich Court, in Herefordshire.

The Fire-lock. Sir Samuel R. Meyrick is in possession of a portrait of a republican officer, said to be that of Colonel Joyce, which proves that the modern firelock is an invention as early as the middle of the seventeenth century, for he has a firelock pistol in his hand. This is important evidence, for it has been shown that the name had been equally applied to the wheel-lock. The firelock was evidently suggested by the snap-haunce. It originated with the French about the year 1635. The steel post on which the furrowed piece had been placed was got rid of, and that set upright on the cover of the pan. The cock was moved sufficiently near to permit its opening; the pan, by the sudden impulse on striking this furrowed piece, performing this operation, and giving fire at the same time. Such a firelock of the time of Cromwell will be found among Skelton's engravings. The term firelock was no longer applied to the fire-arm with the wheel, which was now termed 'the rose or wheel lock.'

The Self-loading Gun originated in Italy about the close of the English Protectorate. The butt was made to answer the purpose of a flask, and a small touch-box was attached to the pan. At the breech was a cylinder, with a hole to receive the bullet. To the axle of this cylinder was affixed a lever, on turning which the bullet was conveyed to its proper place; sufficient portions of charge and priming were cut off, and the piece cocked at the same time. This, therefore, rendered the firelock just described as expeditious as the long bow; but the contrivance was attended with great danger, and occasioned the subsequent inventions of a moveable breech containing several charges, or a small barrel to be brought to the breech when requisite to load, &c.; but none of these contrivances were ever adopted by infantry regiments.

In 1712, a brass fire-arm called the *Fancy gun* was invented. It was in the shape of a walking-cane, and might be used as a gun or pistol; but it was never used for military or even general purposes.

Musket-Arrows, sometimes called fire-arrows, are at least as old as the time of Queen Elizabeth. They occur in the inventories of the royal arsenals. Sir Richard Hawkins, in the account of his voyage to the South Sea in the year 1591, speaks of using them with great success. In Elizabeth's time, these arrows, which carried combustibles, were of wood; at a subsequent period they were made of iron. Arrows of this latter kind were used in the Civil Wars, at the siege of Lyme. Lord Bacon says the arrows shot by muskets were called sprights.

The Match-box. One great inconvenience, says Sir Samuel Meyrick, of the burning match was, that it discovered the soldier on guard, and counteracted the necessary secrecy for enterprizes by night. To remedy this defect, small tubes of tin or copper, pierced full of holes, were invented by a Prince of Orange, apparently Prince Maurice. They are thus described by Walhuysen, a captain of the town of Danzig, in his *Art Militaire pour l'Infanterie*, printed in 1615. 'It is necessary that every musqueteer should know how to carry his match dry in moist or rainy weather, that is, in his pocket or in his hat, by putting the lighted match between his head and hat, or by some other means to guard it from the weather. The musqueteer should also have a little tin tube, of about a foot long, big enough to admit a match, and pierced full of little holes, that he may not be discovered by his match, when he stands sentinel, or goes on any expedition.' This was the origin of the match-box, till lately worn by our grenadiers on one of the cross belts in front of their chests.

The Powder-horn and Flask. The convenient form of the horn to hold gunpowder, one end being broad, into which it might be conveyed with ease, and the other with a small aperture by which it might be discharged into the barrels of fire-arms, naturally suggested it as best adapted for the purpose. But it was not long before the narrow end was entirely closed, and the broader one furnished with a tube that might contain just sufficient powder for one charge. In this state it appears suspended in front from the necks of the arquebusiers in the triumph of Maximilian I. This modification of the powder-horn suggested the more capacious flask, which, with its name, in reference to its resemblance to a bottle, is of German origin. The flask was known in England as early as the reign of Henry VIII., and appears on a hackbutter of that date in one of Strutt's

engravings, taken from an original drawing in the British Museum, suspended like the horn, but at the hip, instead of on the breast. So in the inventory, taken 1 Edward VI. we have 'One horne for gonne-powder, garnished with silver. Three grete flasks covered with vellet, and three lytle touch boxes.' And in that at Hengrave, 'xxiiij flasks, and as many toothe boxes.' M. Montgomeri Corbesson, in his *Treatise on the French army in the time of Henry IV.* informs us that 'the captain of a company, mounting guard, ought to carry an arquebuse and a powder-flaske, and wear on his head a great plume of feathers.' Varieties of powder-horns and flasks will be found in Skelton's engravings.

The Touche-box. Gunpowder was at first not corned: when, however, it had been manufactured into granules, such as were considered proper for the charge, it was discovered that the finer these were made the quicker would they ignite. This was the origin of priming or serpentine powder, and consequently of a small case to hold it, which is in reality a flask on a smaller scale, to which the name given was touch-box.

Bandoliers. To enable the soldier to load his piece with greater rapidity, small cylindrical boxes, each containing one charge of powder, either of wood or tin, and covered with leather, were suspended to a belt or band, put either over the shoulder or fastened round the waist. They seem to have been first introduced in the reign of Henry III. of France. The earliest instance which Sir Samuel Meyrick met with of the bandolier was in Montfaucon's *Monarchie Françoise*, pl. ccxiv.; Davis, in his *Art of War*, he says, would induce the belief that the English received them from the Walloons in the neighbourhood of Liege. Sometimes six were placed before, and six behind the person, when slung over the shoulders; sometimes more. Nine are appended to a waist-belt in Mr. Meyrick's collection. Immense numbers still remain at Hampton Court. Sir James Turner, who published his work in 1670, says they were first laid aside about thirty years before by the Germans. Soldiers who were without cloaks could not keep them from snow and rain which soon spoiled them, and made the powder useless; and in surprisals, the noise which they made betrayed those who carried them.

The Cartridge. Sir James Turner, speaking of the pistol, says, 'all horsemen should always have the charges of their pistols ready in patrons, the powder made up compactly in paper, and the ball tied to it with a piece of pack-thread.' In this description we have evidently the cartridge, though not expressed by name. It is a curious fact that these were first confined to the cavalry, and that the general adoption of the cartridge was not earlier than the common use of the modern firelock. Lord Orrery, in his *Treatise on the Art of War*, says, 'I am, on long experience, an enemy to the use of bandoleers, but a great approver of boxes of cartridges, for then, by biting off the bottom of the cartridge, you charge your musket for service with one ramming. I would have these cartridge-boxes of tin, as the carabiners use them, because they are not so apt to break as the wooden ones are, and do not in wet weather, or lying in the tents, relax. Besides, I have often seen much prejudice in the use of bandoleers, which, being worn in the belts for them above the soldiers' coats, are often apt to take fire, especially if the matchlock musket be used; and when they take fire, they commonly wound and kill him that wears them, and those near him; for likely, if one bandoleer take fire, all the rest do in that column; they often tangle those which use them on service, when they have fired, and are falling off by the flanks of the files of the intervals to get into the rear to charge again.'

The Patron was an upright semi-cylindrical box of steel, with a cover moving on a hinge, filled with a block of wood with five perforations to hold as many pistol-cartridges. Skelton has engraved some of Elizabeth's time, and in the *Diversarum Gentium Armatura Equestris*, printed in 1617, the German cavalry are represented with a brace of pistols in the same holster at the saddle-bow, and patrons at their hips.

The Sweynes-feather, and Musket-rest. To remedy the inconvenience of a musketeer's being compelled to draw his sword, and defend himself after the discharge of his piece, and to render him more competent to act against the pikemen, a long thin rapier blade, fixed into a handle, and carried in a sheath called a sweynes feather, i.e. hog's bristle, the invention of which is by its other name attributed to the Swedes, was given him instead. This, after a discharge, he drew out of its scabbard, and fixed into the

muzzle of his gun, which gave him a weapon of great length; but as the soldier had then more to carry in his hand than previously, an attempt was made to unite the sweynes-feather with the rest. This latter, instead of having a wooden shaft simply, was made of a thin tube of iron, covered with leather, which held within it the feather. Thus it was preserved from rain, and when wanted, it could be ejected by a jerk. The sweynes-feather was invented in the reign of James I. During the civil wars, its name was sometimes corrupted into swan's-feather. One of the musket-rests, armed with a projecting pike from one of the prongs of its fork, is represented in Grose's *Treatise on Antient Armour*, pl. xl. fig. 5. The Duke of Albemarle, in his *Observations upon Military and Political Affairs*, written in 1646, and printed in 1675, recommends arming musketeers and dragoons with muskets and sweynes-feathers, with the heads of rests fastened to them. The rests themselves were apparently disused about the middle, or toward the latter end of the civil wars, the weight and incumbrance of the musket and its apparatus being probably found too great for the active service inseparable from campaigns carried on by small detachments.

The *Bayonet*. Sir Samuel Meyrick observes, that as the sweynes-feather was laid aside when the rest which contained it was relinquished, the musketeers were reduced to the same inconvenience as they experienced before it had been invented. To resume the simple sweynes-feather was not deemed expedient, as from its length it was extremely awkward to manage, and pikemen were a species of troops that had become disused. This induced such soldiers as were armed with daggers to stick them into the muzzles of their pieces after having fired. In this practice we have the origin of the bayonet, which was so termed from having been first made at Bayonne. The French called them bayonet à marche, and first introduced them into their army in 1671. These were formed with plain handles, formed to fit tight into the muzzles, rather enlarging towards the blade to prevent their entering too far into the piece. Subsequently a ring was added, by which it was placed on the muzzle, in which way the French used it in the reign of William III., to the astonishment of the 25th regiment of foot, on whom they poured a volley, halting in their charge.

Besides the authorities quoted in this article, Grose's *Military History*, Henry's *History of Britain in the Different Periods*, Strutt's *Manners and Customs*, and the various authors quoted by them, may be referred to.

ARMS. COATS OF. [See HERALDRY.]

ARMSTRONG, JOHN, a poet and physician, born at Castleton, in Liddesdale, about the year 1709. He qualified himself for his profession at the university of Edinburgh; and came to pursue his fortune in London, where he obtained some celebrity as an author, but never gained much practice as a physician. He had, however, interest enough to procure the appointment of physician to the army in Germany in 1760. He died in September, 1779.

His principal work is a didactic poem on the 'Art of Preserving Health,' published in 1744. Didactic poems find few readers now; and the poem of Armstrong is probably very seldom read. Yet the work is well spoken of by critics of the last century, as containing vigorous sentiments poetically expressed, and much valuable instruction respecting diet, regimen, and locality in reference to health; it has obtained a place in many collections of the works of British poets. Armstrong's other pieces are numerous, and now nearly forgotten. He contributed to Thomson's *Castle of Indolence* the stanzas at the end of the first canto, descriptive of the diseases produced by indolence. His society seems to have been courted by men of talent, for besides this evidence of intimacy with Thomson, Wilkes, Smollet, and Fuseli, are named among his friends. (Aikin, *Gen. Biog.*; Life in Chalmers's *British Poets*.)

ARMY, THE ENGLISH. The word *army*, like many other military terms, has come to us from the French. They write it *armée*, 'the armed,' the 'men in arms,' which is precisely what the English word *army* means. An army is defined by Locke to be a collection of armed men obliged to obey one man. There are various definitions given by writers on the Law of Nations.

The word *army* is not used to designate a single regiment or battalion, or any small body of armed men. An army is a large body of troops distributed in divisions and regiments each under its own special commander, and having officers of various descriptions to attend to all that is necessary to

make the troops effective when in action; the whole body being under the direction of some one commander, and moving according to his orders. This officer is called the commander-in-chief, the general, and sometimes the generalissimo, that is, the chief among the generals.

We may briefly explain why we limit this article to a sketch of the origin of the English army, without including as is sometimes done in similar works, an historical sketch of the armies of antient nations. The armies of Greece, Rome, and the antient Oriental nations, were, owing to various causes, different from those of modern Europe, and the consideration of their true character belongs to the history of those nations. From the impossibility of saying anything satisfactory within reasonable limits, and also from a desire to avoid the errors which we observe in all short sketches of this description, we shall, under such heads as GREEKS, ROMANS, EGYPTIANS, &c., notice their military system, so far as it possesses a distinct character.

The history of the armies of continental Europe, as, for instance, that of Prussia, is inseparably connected with the political history of each state, and will be treated under those heads. For other particulars connected with the formation of an army, see ENLISTING, RECRUITING, SOLDIER, and also MILITIA.

The whole military force of a nation constitutes its army, and it is usual to estimate the comparative strength of nations by the number of well-appointed men which they are able to bring into the field. In another sense, an army is a detachment from the whole collected force; a number of regiments sent forth on a particular expedition under the command of some one person who is the general for that especial purpose. Instances of this latter sense of the word occur in the expressions 'Army of Italy,' 'the Army of Spain,' &c., as formed by Napoleon. Such a detachment may be a large or a small army; and should it return with its ranks greatly thinned and without many of its officers, it would still be an army, if the distribution into divisions and regiments remained, though actually consisting of not more than a single regiment with its full complement of men and officers. In this state it is sometimes not unaptly called the skeleton of an army.

An army is the great instrument in the hands of a government, by which, in the last extremity, it enforces obedience to the laws at home, and respect from other powers who show a disposition to encroach upon any rights belonging to the nation. When the efforts of the ministers of peace and justice at home are inadequate to enforce submission to the laws; when the correspondence of cabinets and the conferences of ambassadors fail in composing disputes which arise among nations, the army is that hand of power which is put forth to maintain order at home and rights abroad.

The legitimate purposes for which an army is maintained are manifestly so important to the well-being of a state, that attention must have been directed to this subject in the very beginning of political society. But to have an army always appointed and always ready for the field can only be effected in a state of high civilization, when the various other offices in a great community are also properly distributed and filled. No better proof can be afforded of the high civilization of Egypt and other countries in early times than the well-appointed and powerful armies which they were able to bring into the field. This was effected in Egypt by having a particular caste or class of soldiers, corresponding pretty nearly to the Kshatriyas of India. (See Herod. ii. 164, &c.) The armies of the Greeks, especially in the post-Alexandrine period, those of Carthage under the command of Hannibal, and the armies of Rome in the best days of the Republic and the Empire, were not inferior to any of modern times in numbers, appointments, discipline, or the military skill of their commanders. It is not, however, to them that we are to trace the origin or the history of our modern armies.

An army, meaning by that term a body of men distinct from the rest of the nation, constantly armed and disciplined, was unknown to the remote fathers of the English and the other modern European nations. The whole male population was the army; that is, every person learned the use of arms, was ready to defend himself, his family, and his possessions; and in time of common danger, to go out to more lasting warfare under the command of some one chief chosen from amongst the heads of the tribes. Such was the nature of the vast armies which presented themselves from

time to time on the Roman frontier, or contended against Cæsar when he made his conquest of Gaul; and such was the power which, on so short a warning, was arrayed against him on the British coast under the command of Cassibelanus, when he made that descent from which neither honour accrued to the Roman arms, nor benefit to the Roman state. In all these nations the warlike spirit was kept up by the sense of danger, not so much from foreign invaders, as from neighbouring and kindred tribes.

In the writings of Cæsar and of Tacitus, the two authors from whom we derive our best acquaintance with the manners and habits of the Germanic and the western nations of Europe, we see the warlike character of those nations, and the principles on which their military affairs were conducted. A whole male population trained to arms; confederating in time of common danger under some one chief; with little defensive armour, and none offensive but darts, spears, and arrows; throwing up occasionally earth-works to strengthen a position—this is the outline of their military proceedings. (Tacit. *Annal.* ii. 14.) There is little peculiar in the military system of the antient Britons; yet it must have been by long practice and perseverance that the warriors attained that skill which attracted the attention of Cæsar. His description of one of their chariots, driven by a charioteer whose attention was solely directed to the management of the chariot, while in it stood the painted warrior dealing his darts around him, or running along the beam while the chariot was in its swiftest motion, presents an object at once picturesque and terrible.

When Britain was reduced to the form of a Roman province, a regular army was introduced and permanently settled in the island, for the purpose of enforcing submission, and of defence against foreign invaders. Many of the remains of Roman authority in Britain, as roads, walls, encampments, and inscriptions, are military. In that curious relic of Roman time, the *Notitia*, which is referred to the age of the Roman emperors, Arcadius and Honorius, we have a particular account of the distribution of the whole Roman army, and we see, in particular, how Britain was then divided for military purposes, and what were the fixed stations of particular portions of the Roman legions.

It was the policy of Rome to recruit its legions from among the barbarous nations, but to employ such soldiers in countries to which they did not belong. Thus, in the inscriptions relating to military affairs which have been found in England, many tribes of Gaul, of Spain, and Portugal, are named as those to which particular soldiers or particular bodies of troops belonged. And so in foreign inscriptions the names of British tribes are sometimes found. The grounds of this policy are apparent. The military portion of these nations was thus drawn away. There remained only the quiet and the peaceable, or the females, the young, the infirm, and the aged. As long as the Roman army was sufficient for their protection, it was well. But when that army was withdrawn, we see, as in the case of Britain, that a people so weakened would easily fall a prey to nations which had never been subdued by the Roman arms, and we see also what was probably the true reason of the difference between the spirited resistance which was made to Cæsar on his two landings in Britain, and the clamorous complaint and feeble resistance with which the people of Britain met the Picts and the Saxons.

From this time we lose sight of any entire British population of the part of the island called England. The conquests made by the Saxons appear to have been complete, and their maxims of policy and war became the principles of English polity. They seem to have been at first in that state of society in which every man is a soldier; and the different sovereignties which they established were the occasion of innumerable contests. We have, however, but little information on this subject; and even the supposed policy of Alfred in the separation of a portion of the people for military affairs, in the form of a national militia, is a part of his history on which we have not any very satisfactory information.

We find, however, that the Saxon sovereigns had powerful armies at their command; and the most probable account of the mode in which they were got together seems to be this:—the male population were exercised in military duties under the inspection of the earls, and their deputies the sheriffs or vicecomites, in the manner of the arrays and musters of later times; being drawn out occasionally for the purpose, and being thus ready to form, at any time when

their services were required, an efficient and powerful force.

We see from that curious remain of those times, a piece of needle-work representing the wars and death of Harold, that the Saxon soldiers were not those half-clothed and painted figures which had presented themselves on the shores of Britain when the Roman armies made their first descent. We see them clothed from head to foot in a close-fitting dress of mail. They have cavalry, but no chariots. The archers are all infantry. Both infantry and cavalry are armed with spears, to some of which little pennons are attached. Some have swords, and others carry bills or battle-axes. They have shields, the bosses on which are surrounded with flourishes and other ornaments; and there are sometimes other devices, but nothing which can be regarded as more than the very rudiments of those heraldic devices which were afterwards formed into a kind of system by the heralds who attended the armies, and by which the chiefs were distinguished from each other, when their persons were concealed by the armour. The piece of needle-work representing the wars of Harold is supposed to be the work of Matilda, the queen of William the Conqueror, and the ladies of her court. It is preserved in the cathedral of Bayeux, whence it is commonly called the Bayeux tapestry. One of the many valuable services rendered to historical literature by the Society of Antiquaries has been the publication of a series of coloured prints, in which we have, on a reduced scale, a perfectly accurate representation of this singular monument of antient English and Norman manners.

A great change took place in the military affairs of England at the Conquest. It is to that period that the introduction of fiefs is to be referred, a system which provided, among other things, for an army ever ready at the call of the sovereign. It may suffice in this place to say, that the king, reserving certain tracts as his own demesne, distributed the greater portion of England among his followers, to hold by military service; that is, for every knight's fee, as they were called, the tenant was bound to find the king one soldier ready for the field, to serve him for forty days in each year. The extent of the knight's fee varied with the varying qualities and value of the soil. In the reign of Edward I. the annual value in money was 20*l.* The number of knights' fees is said by old writers to have been 60,060. The king had thus provision made for an army of 60,000 men, whom he could call at short notice into the field, subject them when there to all the regulations of military discipline, and keep them for forty days without pay, which was usually as long as their service would be required in the warfare in which the king was likely to be engaged. When their services were required for any longer time, they might continue on receiving pay.

Writs of military summons are found in great abundance in what are called the 'Close Rolls,' which contain copies of such letters as the king issues under seal. But this system, it is evident, had many inconveniences; and the kings of England had a better security for the protection of the realm against invasion and for the maintenance of internal tranquillity, in that which seems to be a relic of Saxon polity. We allude to the liability of all persons to be called upon for military service within the realm; to the power which the constitution gave to the sheriff to call them out to exercise, in order that they might be in a condition to perform the duty when called upon; and to the obligation which a statute of Edward I. imposed on all persons to provide themselves with certain pieces of armour, which were changed for others by a statute of James I. We see in this system at once the practice of our remoter ancestors, and the beginning of that drafting of men to form the county militia which is a part of the military polity of the country at present.

The sheriffs were the persons to whom the care of these affairs was committed; but it was the practice of the early kings to send down into the several shires, or to select from the gentry residing in them, persons whose duty it was to attend the musters or arrays, which were a species of review of these domestic troops, and who were intended, as it seems, to be a check upon the sheriffs in the discharge of this part of their duty. The persons thus employed were usually men experienced in military affairs; and when the practice became more general, there was a permanent officer appointed in each county, who had the superintendence of these operations, and was called the lieutenant: this is the origin of the

present lord-lieutenant of counties, an officer who cannot be traced to a period earlier than the reign of Henry VIII.

Foreigners were also sometimes engaged to serve the king in his wars; but these were purely mercenary troops, and were paid out of the king's own revenues.

We see, then, that the early kings of England of the Norman and Plantagenet races had three distinct means to which they could have recourse when it was necessary to arm for the general defence of the realm: the quota of men which the holders of the knights' fees were bound to furnish; the posse-comitatûs, or whole population, from sixteen to sixty, of each shire, under the guidance of the sheriffs; and such hired troops as they might think proper to engage. But as the posse-comitatûs could not be compelled to leave the kingdom, and only in particular cases the shire to which they belonged, the king had only his feudal and mercenary troops at command when he carried an army to the continent, or when he had to wage war against even the Scotch or Welch. We are not to suppose that troops so levied, especially when there were but contracted pecuniary resources for the hiring of disciplined troops of other nations, would have been sufficient to make head against the power of such a sovereign as the king of France, and once to gain possession of that throne. And this leads us to another important part of our subject.

The mutual inconveniences attendant on the nature of the military services due from those who held the feudal tenures of the crown naturally disposed both parties to consent to frequent commutations. Money was rendered instead of service, and thus the crown acquired a revenue which was applicable to military purposes, and which was expended in the hire of native-born subjects to perform service in the king's armies in particular places and for particular terms. The king covenanted by indenture with various persons, chiefly those of most importance in the country, to serve him on certain money-terms with a certain number of followers, and in certain determinate expeditions. There appears little essential difference between this and the modern practice of recruiting armies. It was chiefly by troops thus collected that the victories of Creci, Poitiers, and Agincourt were gained.

In the office of the Clerk of the Pells in the Exchequer, Dugdale perused numerous indentures of this kind, and has made great use of them in the history which he published of the Baronage of England. A few extracts from that work will show something of the nature of these engagements.

Michael Poynings, who was at the battle of Creci, entered into a contract with King Edward III. to serve him with fifteen men at arms, four knights, ten esquires, and twelve archers, having an allowance of twenty-one sacks of the king's wool for his and their wages. Three years after the battle of Creci, King Edward engaged Sir Thomas Ughtred to serve him in his wars beyond sea, with twenty men at arms and twenty archers on horseback, taking after the rate of 200*l.* per annum for his wages during the continuance of the war. In the second year of King Henry IV., Sir William Willoughby was retained to attend the king in his expedition into Scotland, with three knights besides himself, twenty-seven men at arms, and one hundred and sixty-nine archers, and to continue with him from June 20th to the 13th of September. When Henry V. had determined to lead an army into France, John Holland was retained to serve the king in his 'voyage royal' into France for one whole year, with forty men at arms and one hundred archers, whereof the third part were to be footmen, and to take shipping at Southampton on the 10th of May next following. In the 12th of Henry VII. John Grey was retained to serve the king in his wars in Scotland, under the command of Giles Lord Daubeney, captain-general of the king's army for that expedition; with one lance, four demi-lances, and fifty bows and bills, for two hundred and ninety miles; with one lance, four demi-lances, and fifty bows and bills, for two hundred and sixty-six miles; and with two lances, eight demi-lances, and two hundred bows and bills, for two hundred miles. These were nearly half what is now the usual complement of a regiment.

Troops thus levied, together with foreign mercenaries, make the nearest approach that can be discovered in the early affairs of the English monarchy to a permanent, or, as it is technically called, a standing army. The king might, to the extent of his revenue, form an army of this description: but as to the other means of military defence or offence put

into his hands, the persons engaged were only called into military service on temporary occasions, and soon fell back again into the condition of the citizen or agriculturist. But the king's power was necessarily limited by his revenue, and the maintenance of a permanent force appears to have been little regarded by our early sovereigns, since, before the reign of King Henry VII. it does not appear that the kings had even a body-guard, much less any considerable number of troops accoutred and ready for immediate action at the call of the king. In modern times, Charles VII. of France (1423-1461) first introduced standing armies in Europe: this policy was gradually imitated by the other European states, and is now a matter of necessity and of self-defence. In England, probably in a great degree owing to her insular situation, this took place later than in most continental countries. Still the example, however, of the continental states, a sense of the great convenience of having always a body of troops at command, and the change in the mode of warfare effected by the introduction of artillery, which brought military operations within the range of science, and made them more than before matters which required much time and study in those who had to undertake the direction of any large body of men, disposed the king and the nation generally to adopt the practice of having a permanent army, varying in numbers with the dangers and necessities of the time.

The few troops who formed the royal guard were the only permanent soldiers in England before the civil war. The dispute between Charles I. and his parliament was about the command of the militia. Charles II. kept up about 5000 regular troops as guards, and to serve in the garrisons which then were established in England. They were paid out of the king's own revenue. James II. increased them to 30,000; but the measure was looked at with great jealousy, and the object was supposed to be the destruction of the public liberties of Englishmen. In the Bill of Rights (1689) it was declared that the raising or keeping a standing army within the kingdom, in time of peace, unless it be with consent of parliament, is against law. An army varying in its numbers has ever since been maintained, and is now looked on without apprehension. It is raised by the authority of the king and paid by him: but there is an important constitutional check on this part of the royal prerogative in the necessity for acts of parliament to be passed yearly, in order to provide the pay and to maintain the discipline.

The following tabular view of the military force of the various civilized nations is from the most recent authorities.

Military Establishments on Foot and in Reserve, 1833, 1834

	Population.	Army.	Militia - Est. Com- m.
America, United States of	13,890,000	6198	1,200,000
Anhalt	138,000	1230	
Austria	33,865,000	271,400	3,000,000
Baden	1,236,000	10,100	
Bavaria	4,163,000	30,000	
Belgium	4,172,000	110,000 (including militia)	
Brasilis	5,130,000	15,000	60,000
Bolivia	1,250,000	3500	30,000
Brunswick	248,000	3007	
Britain, Great (United Kingdom of)	24,900,000	108,673	
Central America	1,800,000	2000	30,000
Chili	1,600,000	8000	25,000
China	198,000,000	1,391,641	
Cochin-China	5,300,000	54,000	15,000
Colombia (Venezuela and New Granada)	1,890,000	20,000	
Church, States of the	2,610,000	10,000	
Denmark	2,030,000	38,319 305,320 (includes land troops)	
East Indies (British)	119,500,000		
Egypt	3,500,000	110,000	
France	32,770,000	300,000	1,000,000
Greece	900,000	10,000	
Hanover	1,660,000	9000	
Havt	850,000	15,000	20,000
Hesse-Cassel	686,000	9000	
Hesse (Grand Duchy of)	741,300	8000	
Holland, without Limburg or Luxemburg	2,730,000	35,000	60,000
Ionian Islands	194,000	1000 (includes Brit. troops)	
Lucca	145,000	800	
Mecklenburg-Schwerin	450,000	3000	
Mexico	6,500,000	25,000	
Modena	330,000	800	
Nassau	305,500	1800	
Oldenburg	247,000	1800	
Paraguay	600,000	8000	20,000
Parma	428,000	1200	
Perlia	19,000,000	25,000	300,000

Peru	1,700,000	3000	
Plata (States of La)	2,400,000	30,000	
Portugal	3,400,000		
Prussia	13,300,000	133,000	400,000
Russia in Europe, and Poland	50,830,000	690,000	
Saxony (Kingdom of)	1,670,000	12,000	
Saxe-Coburg-Gotha	160,000	600	
Saxe-Meiningen	143,000	500	
Saxe-Weimar-Eisenach	335,800	1100	
Sardinia	4,370,000	39,640	
Scindiah	4,000,000	32,000	
Sweden and Norway	4,050,000	41,540	130,000
Switzerland	2,100,000	33,578	{ 33,578
Sicilies (Kingdom of the Two)	7,500,000	30,000	(reserve)
Siam	2,800,000	60,000	
Spain	14,300,000	71,300	{ 35,000
Tuscany	1,400,000	5500	(on paper)
Turkey	8,000,000	30,000	130,000
Württemberg	1,620,000	16,900	

It may be added that, according to Schnabel's calculations in 1832, the standing armies maintained by the principal European States relatively to their respective populations were as follows:—

Denmark	1 in every 50 inhabitants
Sweden	1 — 53
Württemberg	1 — 59
Poland	1 — 60
Prussia	1 — 68
Bavaria	1 — 69
Russia	1 — 70
Austria	1 — 100
France	1 — 110
England	1 — 140
Two Sicilies	1 — 200
Tuscany	1 — 400
States of the Church	1 — 500

We should observe, however, that the data which he assigns as the ground-work of his calculations do not in general agree with our own, which, in most cases, are derived, if not from official, at least from competent authorities.

The following is a more complete subdivision of the British force:—

Officers	Great Britain	4404	
	India	1208	
			5612
Non-commissioned officers	Great Britain	6265	
	India	1468	
			7739
Rank and file	Great Britain	77,847	
	India	17,480	
			95,327
			108,672
Great Britain	88,516		
India	20,156		
			108,672

ARNAOUTS, the name given to the inhabitants of Albania. [See ALBANIA.]

ARNALDO DA BRESCIA was born in the town of Brescia about the beginning of the twelfth century. He studied in France under the famous Abelard. Having returned to Italy, he became a monk. The corruption of the clergy was very great at that time, and Arnaldo, endowed with an impassioned mind and a great flow of oratory, began to hold forth in public against the ambition, the temporal power, and the luxurious life of abbots, prelates, and cardinals, not sparing the Pope himself. The scandalous contest between the church and the empire carried on by the haughty pretensions of Gregory VII. was then fresh in the memory of men. Arnaldo maintained that ecclesiastics as well as laymen ought to be subordinate to the civil power; that the disposal of kingdoms and principalities did not belong to the church of Christ; and that the clergy ought to be satisfied with their tithes and the voluntary oblations of the faithful, and not to hold, as they then did, sovereign lordships and feudal estates. To these doctrines he added others of a mystical character about the Trinity and the nature of the soul, which were eagerly laid hold of and perhaps distorted by his enemies. His declamations against the clergy indisposed the Papal court towards him. By preaching against the temporalities of the church, Arnaldo had excited the passions of the people; Brescia revolted against its bishop, the fermentation spread to other towns, and

complaints against the author of all this poured in at Rome. Innocent II., upon this, had Arnaldo condemned, together with other heretics, in the council of Lateran, in 1139. Such at least is the positive statement of Otho of Freisingen and other historians of those times, but Arnaldo's name is not mentioned in the canons of the council. He was not excommunicated at that time, but was banished from Italy, and forbidden to return without the Pope's permission. (See Mosheim's *Ecclesiastical History*, translated by Dr. Murdock, and the translator's note on the subject of Arnaldo.) He then proceeded to France, where he seems to have found favour with the papal legate Guido, afterwards Pope Celestinus II.; but he met with an unrelenting adversary in St. Bernard, the zealous and vehement Abbot of Clairvaux, who denounced Arnaldo, wrote against him, and forced him to seek refuge at Zürich, where he remained five years. He there resumed his preaching against the abuses of the clergy, and found many favourable listeners. But St. Bernard traced him there also, and caused the Bishop of Constance to banish him from his diocese. Arnaldo upon this returned to Italy, and hearing that the people of Rome had revolted against the Pope, he repaired there, and put himself at the head of the insurrection. Lucius II. had died of the wounds received in a popular affray, and Eugenius III., a disciple of St. Bernard, succeeded him in the papal chair, but was driven away from the city by the people and the senate. Arnaldo exhorted the Romans to re-establish the Roman republic with its consuls, to reinstate the equestrian order, and to emulate the deeds of their glorious ancestors. The multitude, thus excited, hurried on to excesses which Arnaldo probably had never contemplated. They attacked and demolished the houses of the cardinals and nobles of the papal party, killed or ill-treated the inmates, and shared the plunder among themselves in the name of Brutus and Cato, Fabius and Paulus Emilius. Arnaldo, however, still remained poor; he really despised wealth, his morals were irreproachable, and it seems that he judged of others by himself, a common delusion among honest popular leaders.

The Roman senate wrote to the Emperor Conrad III., professing allegiance, and inviting him to come and be crowned at Rome; but the Emperor paid no attention to the invitation. Rome continued for ten years in a state of agitation little differing from anarchy, at war with the Pope and the people of Tibur, and at variance within itself. St. Bernard, in his epistles, draws a fearful picture of the state of the city at that time. Eugenius III. died in 1153, and his successor Anastasius IV. having followed him to the grave shortly after, Adrian IV. was elected Pope in 1154. He was a man of a more determined spirit than his predecessors. A cardinal having been attacked and seriously wounded in the streets of Rome, Adrian resorted to the bold measure of excommunicating the first city in Christendom, a thing without a precedent. The Romans, who had set at naught the temporal power of the Pope, quailed before his spiritual authority. In order to be reconciled to the pontiff, they exiled Arnaldo, who took refuge among some friendly nobles in Campania. When the Emperor Frederic I. came to Rome to be crowned, the Pope applied to him to have Arnaldo arrested. Frederic accordingly gave his orders to the Margrave or Viscount of Campania, and Arnaldo, being delivered into the hands of the Prefect of Rome, was strangled, his body burnt, and the ashes thrown into the Tiber, in the year 1155. [See ADRIAN IV.]

ARNAULD, ANTOINE, a French theological and philosophical writer of the seventeenth century, was born at Paris in 1612. His father, named also Antoine Arnauld, was a distinguished advocate, and a great antagonist of the Jesuits, against whom he both pleaded and wrote; and indeed he mainly contributed to their expulsion from France under Henry IV. The Jesuits were afterwards re-admitted into the kingdom, but they met with an opponent in the younger Arnauld as determined as his father had been. Arnauld, after being ordained priest, was made Doctor of the Sorbonne in 1641. He exhibited an early disposition for theological controversy, by writing the *Théologie Morale des Jésuites*, in which he exposed the dangerous casuistry adopted by several moralists of that order. The Jesuits, who had not forgotten the hostility of the elder Arnauld, retorted against the son, by violently attacking his work *De la Fréquente Communion*, which was published in 1643. Soon after, the disputes which broke out among the French clergy about Jansenius, bishop of Ypres, and his book *Augustinus*

several propositions of which concerning the intricate questions of grace and free-will had been condemned by the Pope, gave Arnauld a fresh opportunity of exercising his polemical talent. [See JANSENIUS.] Arnauld took the part of Jansenius in two letters, which were condemned by the Sorbonne, and the writer, on his refusing to retract his opinions, was expelled from that learned body. He then withdrew to Port Royal des Champs, a convent of nuns, not far from Paris, of which his sister Angelique Arnauld was the abbess, and where Pascal, Nicole, and other learned men of that time, who were friends of Arnauld and shared his opinions, resorted for quiet and studious retirement. There they wrote various works on literature, philosophy, and religion, which bear the name of the works of MM. de Port Royal. Arnauld wrote parts of several of these works, such as the *Grammaire Générale Raisonnée*; *Eléments de Géométrie*; and *L'Art de Penser*. He also had a share in the famous letters written by Pascal against the Jesuits, which are known by the name of *Lettres Provinciales*. The disputes about Jansenius and his five propositions, after agitating all France for many years, and drawing bulls of censure from several Popes, to which a part of the French clergy refused to submit, notwithstanding the imperious orders of Louis XIV., were at last appeased for a time by the conciliatory spirit of Pope Clement IX., who accepted a compromise. This was called the peace of Clement IX. Arnauld contributed to this desirable arrangement by an eloquent memorial, which he addressed to the pontiff through the Abbé Rospigliosi, the Pope's nephew. After this peace, Arnauld was presented to the Pope's nuncio, and also to Louis XIV., who received him graciously, and invited him 'to employ his golden pen in defence of religion.' His next work, in which he was associated with his friend Nicole, *De la Perpétuité de la Foi de l'Eglise Catholique touchant l'Eucharistie*, was dedicated to the Pope. This occasioned a warm controversy between Arnauld and the reformed minister Claude, in the course of which Arnauld wrote *Du Renversement de la Morale de J. C. par la Doctrine des Calvinistes touchant la Justification*, Paris, 1672. Arnauld, at the same time, continued his war against the Jesuits, and wrote the greater part of the work styled *Morale Pratique des Jésuites*, 8 vols., 12mo., in which many authentic facts and documents are mixed up with party bitterness and exaggeration. That powerful and ambitious society did not bear this patiently; they represented Arnauld as a dangerous man, and the leader of a sect, whose house was the resort of many restless and turbulent spirits, the old adherents to the errors of Jansenius. Harlay, the Archbishop of Paris, assisted in prejudicing the king against Arnauld, and Louis XIV. issued an order for his arrest, which, however, does not seem to have been very earnestly enforced. Arnauld concealed himself for some time at the house of the Duchess of Longueville, who esteemed him and appreciated his talents; but afterwards considering it prudent to leave France, he repaired to Brussels in 1679, where the Marquis of Grana, the Spanish governor of the Low Countries, assured him of his protection. There he published, in 1681, his *Apologie pour les Catholiques*, which is a defence of the English Catholics against the charges of Titus Oates' conspiracy. In this work, laying aside all party animosities, he undertook the defence of his old antagonists the Jesuits, whom he considered as having been calumniated in those transactions. This apology was, at the same time, a refutation of a book of Jurieu, the well-known reformed minister in Holland, who had accused the French clergy of being implicated in the English conspiracy. Jurieu, in reply, published a book entitled *L'Esprit de M. Arnauld*, written in a style of coarse personal invective, to which Arnauld did not condescend to reply. Another work, not so creditable to Arnauld's judgment, is one against the Prince of Orange, William III. of England, whom he styled a new Absalom, a new Herod, and a new Cromwell. (8vo. 1689.) It was published anonymously, like most of Arnauld's works, and many persons did not believe it to be his; but it seems now ascertained that he was the author. It is said that Louis XIV., whose political views it suited, had this book printed and distributed at his own expense.

From his retirement at Brussels Arnauld made several excursions into Holland. His reputation had spread everywhere, and he was kindly received. About this time he entered into a controversy with his old friend Father Mallebranche, who, in his metaphysical works, had announced

some peculiar doctrines on the subject of grace, predestination, and other theological problems. Arnauld began by attacking Mallebranche's definition of the nature of our ideas, and his famous proposition that 'we see all objects in God.' In refutation of these, Arnauld wrote his *Traité des Vraies et des Faussees Idées*, Cologne, 1683; and afterwards, *Réflexions Philosophiques et Théologiques sur le Nouveau Système de la Nature et de la Grace du Père Mallebranche*, 1685; besides nine letters addressed to the Father on the same subject. This controversy was carried on by Arnauld with his usual vehemence, and it had the effect of souring Mallebranche's naturally pacific temper. The Father wished for a truce; he declared 'he was tired of making himself a spectacle to the world, and of filling the *Journal des Savans* with their mutual wranglings.' But controversy was Arnauld's element; without any feeling of malignity in his disposition, his zeal for truth, or what he considered as truth, joined to a great fluency of expression and a mind of iron, made him restless and fond of disputation. His friend Nicole, whose temper was milder, told him one day he was weary of disputes, and wished to rest himself. 'Rest!' exclaimed Arnauld, 'will you not have enough of rest hereafter during all eternity?' He continued to the last, although past eighty years of age, to carry on his various controversies, with the Jesuits, with Mallebranche, with the Calvinists and with the sceptic philosophers, among whom was Bayle. He also wrote on several points of dispute between Rome and the Gallican church. His last work was *Réflexions sur l'Eloquence des Prédicateurs*, 1694. He died in his exile at Brussels, on the 8th of August of that year, after receiving the sacrament from the curate of his parish. There is an interesting account of his last moments by Father Quesnel, who was his companion in the latter years of his life. He was buried in the church of St. Catherine at Brussels, but his heart was embalmed and taken to Port Royal des Champs, where it was deposited with the remains of his mother and six sisters, who had all been inmates of that convent. Boileau and Racine wrote epitaphs in honour of Arnauld. His works, which filled more than 100 volumes of various sizes, were collected and published at Lausanne and at Paris, in 50 volumes, 4to., 1775-83. The last volume contains the author's biography. Arnauld was one of the most learned men of his age, a sincere but enlightened Catholic, pious without superstition or hypocrisy, exemplary in his conduct, and disinterested and simple in his habits and manners. Although frequently at variance with Rome, he was esteemed there, and had friends among the cardinals. While he was persecuted in France, Pope Innocent XI. offered him an asylum at Rome. He had, likewise, many friends among the Protestants, in Holland and elsewhere. Arnauld was one of the first to extricate theology from scholastic subtleties; he adopted in his exposition of theological subjects a clear logical method, and supported himself by frequent references to the fathers and to the early councils, in the history of which he was deeply versed, as well as in the study of the Scriptures. He contributed to the French version of the New Testament published at Mons, and he was an advocate for having the Missal, or service of the church, translated into the vulgar tongue. His brother, Henri Arnauld, Bishop of Angers—where he died in 1694, at the age of ninety-five—bore the character of a most benevolent and diligent pastor. Another and an older brother, Robert Arnauld d'Andilly, filled several offices at the French court, but at the age of fifty-five retired to Port Royal, where he died in 1674. He wrote several religious works. Robert's son, Simon Arnauld, Marquis of Pomponne, was employed in several diplomatic missions under Louis XIV., and was made Secretary of State for Foreign Affairs in 1672. He died in 1699. [See PORT ROYAL.]

ARNOLD, JOHN, was born in 1555, at Ballenstadt, in the duchy of Anhalt. He first studied medicine, but afterwards applied himself to theology, and became a clergyman of the Lutheran church. Being grieved at the relaxed state of morals among the Protestants of Germany, he wrote a book 'on true Christianity,' with the object of giving the study of religion a practical influence on the moral conduct of its followers. 'Divinity,' says he, 'is not a mere speculative science, a branch of polite learning, but a living experience, and a practical exercise of the mind. We must not content ourselves with a dead and barren faith; true faith ought to be preceded by repentance, accompanied by love, and followed by a renewal of the soul.' This work, first published in German, has been translated into Latin,

French, Danish, Flemish, Bohemian, and English, and has been highly praised by Mosheim, Professor Frank of Halle, Dr. Spener, and other distinguished divines. John Wesley, in his Christian Library, gives a copious extract from it. It has been called the Protestant's Kempis. Arndt was a great promoter of practical religion, or that which, in ecclesiastical history, is called *pietism*. He was accused by the exclusive partizans of the doctrine of grace of attributing too much to the strength and ability of man in the work of conversion. Osiander of Tübingen wrote against him his *Judicium Theologicum*. Yet Arndt's book is still considered one of the best treatises of Christian morality ever written. An English translation was published in 1815 by William Jaques—*True Christianity, or the whole Economy of God towards Man, and the whole Duty of Man towards God*. 2 vols. 8vo. London. Arndt was minister at Quedlinburg, and afterwards at Brunswick. In the latter place, his success as a preacher made him enemies, and he was obliged to leave the town and to withdraw to the village of Isleb, where he remained for some years. In 1611 George Duke of Lüneburg presented him to the church of Zell, and afterwards appointed him general superintendent of all the churches of the duchy. Arndt died at Zell in 1621. He had preached a sermon the day before, and on returning home he said to his wife that he had delivered his funeral sermon. He bore the attacks and persecutions of his enemies with the greatest meekness; his charity to the poor was very extraordinary for his limited means, and it made ignorant people suppose that he had discovered the philosopher's stone. Arndt's favourite authors were St. Bernard, Thomas à Kempis, and Tauler. He must not be confounded with Josiah Arndt, also a Lutheran clergyman, born in 1626, who was professor at Rostock, and who published several works on philosophy, divinity, and history; among others, *Lexicon Antiquitatum Ecclesiasticarum*. 4to. Greifswald, 1669. He died in 1685.

ARNE, THOMAS AUGUSTINE, Doctor in Music, born in 1710, was the son of an upholsterer in King Street, Covent Garden, and educated at Eton, having been intended for the profession of the law; but his bias towards music was too strong to allow him to pursue his legal studies successfully, and after the usual struggles between duty and inclination, the latter, as commonly happens, prevailed. He secretly practised on the spinnet, and took lessons of Michael Festing, an eminent person in his day, on the violin, and the first intimation his father had of his musical progress was at an amateur party, in which young Arne was discovered playing the first fiddle most skilfully. Resistance was now worse than useless, and the resigned parent supplied his son with the means of continuing his favourite pursuit in an advantageous manner. He soon imbued his sister with a love of the vocal art, and qualified her to appear in Lampe's opera, *Amelia*, in which her débüt was of so promising a kind, that her brother, though then only eighteen years of age, set for her Addison's *Rosamond*, in which she represented the heroine, and shortly after became the celebrated Mrs. Cibber. The success of this opera led of course to the composition of others, and in 1738 Arne produced his *Comus*, in which he evinced powers of the higher kind, and his reputation was at once established. In 1740 Arne married Miss Cecilia Young, a pupil of Geminiani, and a performer of eminence. In 1742 he went with her into Ireland, where both were engaged by the Dublin manager, the one to sing, the other to compose. There he produced his masques, *Britannia*, and *The Judgment of Paris*; *Thomas and Sally*, an afterpiece; and *Eliza*, an opera. In 1745 he acceded to the request of the proprietor of Vauxhall, who thus added Mrs. Arne to the list of his vocal performers, her husband at the same time becoming his principal composer. Subsequently, he wrote his two oratorios, *Abel* and *Judith*, after which the University of Oxford conferred on him the degree of Doctor in Music. His greatest work, or that which has most contributed to his fame, *Artaxerxes*, was composed in 1762, in imitation of the Italian opera, and to prove the English language not so repugnant to recitative as many had imagined. The attempt was bold, but triumphant; the decided approbation which crowned the composer's labours, and the judgment pronounced on it by posterity, prove beyond dispute its many and great merits. The drama is a translation, by Arne himself, of Metastasio's *Artaserse*; and when compared with many similar works, whether of his contemporaries or of professed authors of a later period, is entitled to the praise which cannot justly be

bestowed on mediocrity. Dr. Arne also produced, in 1765, an entire Italian opera at the King's Theatre, Metastasio's *Olimpiade*, of which no notice is taken by any of his biographers. He afterwards composed *The Fairies*, the music to Mason's *Elfrida* and *Caractacus*, additions to Purcell's *King Arthur*, the dramatic songs of Shakspeare, the airs for the Stratford Jubilee, &c. *Love in a Village* is a *pasticcio*, or compilation from various composers, but many pieces in this still pleasing ballad-opera are by Arne, and among these 'Gentle youth, ah! tell me why?' can never become antiquated. In other departments of music he proved eminently successful. Warren's collection of canons, glees, &c., contains several of his compositions, of which 'Come, shepherds, we'll follow the hearse,' in Cunningham's elegy on the death of Shenstone, must charm as long as vocal harmony retains the power to please. His song and chorus, 'When Britain first at heaven's command,' or 'Rule Britannia,' need hardly be mentioned as the offspring of his genius; it may be said to have wafted his name over the greater half of the habitable world. Dr. Arne died in March, 1778, and was buried in St. Paul's church, Covent Garden, leaving an only son, who died, we believe, without issue.

ARNHEIM, ARNHEM, or AERNEM, the Roman Arenacum (though this is sometimes disputed), a fortified city on the right bank of the old Rhine, now the capital of Guelderland, and formerly one of the Hanse towns; it lies 50 Eng. miles S.E. of Amsterdam: 52° N. lat. 5° 52' E. long. Arnheim is first mentioned under this name in a charter, or grant of privileges, from the emperor Otho III. A.D. 996. About two miles above Arnheim the canal of the Yssel branches off from the main river, and carries part of the waters of the Rhine to Doesburg, where this cut joins the Yssel, which flows into the Zuider Zee. This junction between the Rhine and Yssel was made by Drusus, the brother of the emperor Tiberius. Arnheim stands at the foot of a small range of hills, which are not of common occurrence in Holland, called the Beluwe, or Veluwe, running irregularly northward towards the Zuider Zee. There is at Arnheim a bridge of boats across the Rhine. The fortifications, which were improved and enlarged by Coehorn in 1702, defend the town on the land side. Arnheim was once the residence of the Counts and Dukes of Guelderland, whose monuments are to be seen in the principal church. Arnheim has four gates, a reformed Dutch church with a high tower, which contains the tomb of Duke Charles of Guelderland, a Roman Catholic church, a small Lutheran church, a handsome governor's residence, and a very old-fashioned state-house. It is the market for the district of the Veluwe and part of the Betuwe; the latter of which is the name of the insulated fertile district between the Rhine, Waal, and Lek. [See B&Rwz.] Coleseed, rye, oats, &c. are brought in great quantity to Arnheim. The trade is mostly a transit trade along the Rhine, and by land between Amsterdam and Germany. The neighbourhood of Arnheim contains many pleasant country residences of the nobility of Guelderland, who generally spend their winter in Arnheim. The town was taken from the Spaniards in 1585: in 1672 it was taken by the French, on the invasion of Holland in the reign of Louis XIV., from whose extortion and tyranny the inhabitants suffered severely: in 1674 the French left it, after destroying the fortifications. In 1813 the Prussians took it from the French, which contributed materially to the change of affairs in Holland at that time. The population on Jan. 1, 1830, was 7194 males, and 7315 females. (See Kampen, *Beschrijving van het K. der Nederlanden*, 1827: Halma's *Tooneel*, &c.)

ARNI, the native Indian name of the wild buffalo. [See BUFFALO.]

ARNO, called by the Romans Arnus, the principal river of Tuscany, rises on the southern slope of Mount Falterona, which is a high western projection from the central ridge of the Apennines, about twenty miles N.E. of Florence, in 11° 39' E. long., and 43° 52' N. lat. On the opposite or north-eastern side of the same ridge are the sources of the Ronco and of the Montone, two rivers which enter the Adriatic below Ravenna. The sources of the Tiber, which several writers have erroneously stated as issuing out of the same mountain, are more than twenty miles farther east, and separated from those of the Arno by the mountains of Camaldoli and La Vernia. The Arno descends by the village of Stia into the long and deep valley called Casentino, one of the higher regions of Tuscany, running in a S.S.E. direction between the great central ridge and an

offset from the same, which, detaching itself from the Falterona, divides the Casentino from the Mugello or valley of the Sieve, and afterwards from the Valdarno, forming the mountains of Crocicchie, Gualdo, Consumi, Vallombrosa, and Pratomagno. The Arno receives in its course numerous torrents from both ridges—the cool streams flowing down the verdant slopes of Casentino's hills, which Dante mentions in Canto 30 of his *Inferno*.

Having passed the large village of Poppi and the town of Bibbiena, the direction of the valley, and consequently the course of the Arno, change to a more southern course, being confined to the eastward by another offset from the central ridge, which, detaching itself from the Alpe de Catenaja to the east of La Vernia, runs southwards by Chiusi and Montecatini towards Arezzo, and divides the waters of the Arno from those of the upper Tiber. Issuing from the lower Casentino, the Arno enters the plain of Arezzo, and running in a south direction by Quarata, receives the waters of the northern Chiana, and then suddenly turns to the westward, entering a deep mountain gorge, appropriately called l'Imbuto, or 'funnel.' Passing through the small valley of Laterina, it issues out of it by another narrow and wild pass called Valle dell' Inferno, which is three miles in length. The Arno next enters the beautiful region called the Upper Valdarno, one of the most delightful rural spots in Tuscany and perhaps in the whole world. It is a valley about fourteen miles in length, and from three to five in breadth, bounded by two ranges of hills, and sheltered on the north-east by the lofty and rugged Apennines, among which the wooded summit is distinguished that overhangs the convent of Vallombrosa. The valley itself is a continued succession of gardens and orchards, and the hills are covered with vineyards or verdant pastures. Several neat towns and villages are scattered about, besides numerous hamlets and cottages on the hill slopes. Through this valley the Arno runs in a N.N.W. direction, its course being nearly parallel to that which it followed higher up in the Casentino. At Incisa the mountains close again on both sides, and the Arno runs through a deep channel excavated in a ridge of limestone rock which is a continuation of the mountains of Vallombrosa, and extends far to the south towards Siena. The river runs here in a direction nearly due north, until it passes Rignano, beyond which, in the mountains on the right bank, a valley opens, through which the Sieve, a large stream coming from the district of Mugello north of Florence, flows into the Arno. Here the Arno, after a circuitous course of more than sixty miles, is only thirteen or fourteen miles direct distance from its source. It now turns westwards by Varlungo, and enters the plain of Florence, dividing that city into two unequal parts. About ten miles below Florence, and beyond the bridge and village of Signa, the Arno runs in a deep channel excavated through the base of Mount Golfolina, which is said to have been cut by the old Etruscans. A wider passage being thus opened for the river, the plain of Florence, which was a marsh before, was drained. The course of the river here diverges one or two points towards the south. Ten miles farther the hills on the left bank recede, and leave a plain between them and the river, in which are the towns of Empoli and San Miniato. Here the Arno receives the Elsa, a considerable stream coming from the south, which has its source in the high lands near Siena that divide the basin of the Arno from that of the Ombrone. On its right bank the Arno receives several streams which come from the northern Apennines above Pistoja, and the waters from the lake or marsh of Fucecchio, and from that of Bientina. About ten miles below San Miniato the Arno, after receiving the Era, a large stream from the south, enters the plain of Pisa, through which it makes several considerable windings, passes through the town of Pisa, and enters the sea about five miles westward of it: 43° 41' N. lat., 10° 15' E. long. Formerly the mouth of the Arno was some miles more to the south, but it having become obstructed, partly by the Genoese sinking many ships in it in their wars against Pisa, and partly by the sand thrown up by the sea during the frequent storms from the S.W., a new cut in a N.W. direction was excavated at S. Pietro in Grado, about three miles below Pisa, through which the waters of Arno were made to run in 1606. The ancient port of Pisa was not at the mouth of the Arno; it was a natural bay formed by the sea, to the southward of the old mouth of the river, at the place where the stream called Calambrone now runs into the sea, and between

that and Leghorn. It is now filled up, and hardly any traces remain of it; but Targioni Tozzetti, in his *Relazione di Viaggi in Toscana*, gives a plan of the harbour as it was, from old documents and drawings. A canal for the *navicelli*, or barges, connects Leghorn and Pisa, and runs partly through the site of the former Porto Pisano. From Pisa barges ascend the Arno to Florence; but the navigation is often interrupted in summer owing to the shallowness of the water. In the time of Strabo (p. 222), and even as late as the fifth century of our era, the Serchio, or river of Lucca, then called the Ausar, instead of discharging itself into the sea, as it now does, entered the Arno below Pisa, and that city stood between the two rivers. How and when the Serchio altered its course is not known, but in the twelfth century it had already assumed its present channel. Still it approaches very near Pisa, to the northward of that city, and in times of inundations its waters mix with those of the Arno. [See PISA.]

The Arno, like all the rivers which descend from the Apennines, is subject to sudden overflows. The quantity of earth and stones which it then carries down from the mountains has raised its bed in many places nearly as high as the adjacent fields. Embankments have been made along the greater part of its course, and are kept up at a considerable expense. But in cases of extraordinary rains and storms in the highlands where it has its source, the Arno rushes down with such fury as to overcome all obstacles and inundate a great part of the country. Among the more disastrous inundations, that of September, 1537, is recorded, when the Valdarno and the whole plain of Florence were overflowed, and trees, mills, cattle, and even houses, were carried away. Two-thirds of the city of Florence were inundated, the water being in some places eight feet above the pavement; and two of the bridges of Florence were carried away. It took several months to clear the mud from the streets and houses. In November, 1740, another great inundation occurred, owing to the prevailing scirocco wind, which melted the snows that had fallen on the Apennines. The confluence of the Sieve, just above Florence, a river which swells from the same causes and generally at the same time as the Arno, greatly contributes to these inundations.

It appears that in remote times the waters of the Arno divided near Arezzo, and part of them flowed southwards by the valley of the Chiana into the Tiber. (Fossombroni, *Memorie Idraulico-Storiche sopra la Val di Chiana*.) A communication by water existed between Arretium and Rome. But the bed of the Chiana becoming raised by deposits of earth, the declivity towards the south, which was already slight, was destroyed, and the whole waters of the Arno turned towards Florence. The northern part of the Val di Chiana then became a marsh, the streams that formerly ran into the Arno remaining stagnant in various places; and it was only in the southern part of the same valley that the waters continued to find their way into the Tiber, after joining the river Paglia near Orvieto. At last the people of Arezzo, in the fourteenth century, cut a canal, which carried part of the waters of the northern Chiana into the Arno. This canal has been since repeatedly enlarged and lengthened by the Tuscan government, and has been the subject of many interesting hydraulic works and experiments. [See CHIANA, VAL DI.]

The whole course of the Arno, with its numerous windings, cannot be less than 140 miles, although in Malte Brun's geography it is stated at 105. Its breadth varies greatly: near Florence it is about 400 feet, but the waters are very low in summer, and the river is then fordable. Within the city of Florence the bed of the Arno is considerably narrower, being confined by the walls of the quays. At Pisa, however, it retains always the appearance of a considerable river. The tract of country watered by the Arno, especially between Florence and Pisa, constitutes the most populous, most productive, and most thriving part of Tuscany. In the upper valleys of the Arno, between Arezzo and Florence, a vast quantity of bones and whole skeletons of the largest quadrupeds of other climates, the mastodon, elephant, rhinoceros, and hippopotamus, are found, as well as beds of lignite. [See APENNINES, GEOLOGY OF.]

ARNOBIUS, according to Hieronymus (*de Viris Illustribus*, c. 79), was a rhetorician and afterwards a presbyter of Sikka in Numidia, in the reign of the Emperor Diocletian. His work *de Rhetorica Institutione* is not extant. Lactantius, the Cicero of the fathers, was the most

distinguished disciple of Arnobius, the Varro of the ecclesiastical writers. Arnobius was as much superior in genius to this pupil as he was surpassed by Lactantius in elegance of diction. Hieronymus informs us, in his *Chronicle*, that Arnobius was in the habit of attacking Christianity, until he had some remarkably impressive dreams, which induced him to wait upon the bishop of Sikka, who, however, did not trust him, knowing his former enmity to the gospel. Arnobius wrote his seven books of 'Disputations against the Heathen' in order to convince the bishop that he was really converted. But the statement of Hieronymus, who refers it to the twentieth year of Constantine, A.D. 326, contains a manifest anachronism. Arnobius appears in his 'Disputations' not like a man recently changed by dreams, nor as a novice; but rather as a man of a ripe conviction, although without ecclesiastical orthodoxy. It may be that the dreams gave the first impulse to his subsequent conversion, or that he was secretly convinced of the truth, without openly professing it, until the dreams induced him to wait upon the bishop, who, in those days of persecution, would be cautious about receiving a man who, as a public character, was known to have been hostile to Christianity, lest he should prove a spy. The caution of the bishop induced Arnobius to declare, in his famous 'Disputations,' his confession of faith and its defence. In this work Arnobius shows a thorough acquaintance with the literature of his age, and thus describes (l. i. c. 39) his change:—'O, blindness! A short time ago I worshipped images coming out from the furnace, and gods made with the hammer on the anvil. When I saw a smooth and anointed stone I spoke to it as to a living power, and prayed to the senseless stone for benefits; and thus unwittingly blasphemed even the false gods, by taking them for stocks, stones, and bones, or fancying that they inhabited such things. Now, I know what all those things are, since I am led by a great teacher into the ways of truth.' It appears that Arnobius came to a knowledge of the truth by carefully reading the New Testament, especially the Gospels, and that he was not biased by the ecclesiastical orthodoxy of the North African church. Arnobius himself mentions the time when he wrote his 'Disputations' (l. ii. c. 71), saying that Rome had then been built about 1050 years. This would bring us, according to the æra of Varro, to A.D. 297. But it appears that Arnobius either used another æra, or only mentioned a round number. His work contains allusions to the persecutions by Diocletian, which commenced A.D. 303. This observation applies also to Arnobius, when he says (l. i. 13), 'Nearly 300 years have elapsed since our Christian community began to exist, perhaps somewhat more or less.' It may be, that Arnobius wrote his work at different periods.

Without these dates we might ascertain generally the time in which Arnobius wrote his 'Disputations' from their contents: he refutes that accusation which had excited the Diocletian persecution, namely, that the public calamities of the empire were a consequence of the spread of the Gospel, which caused a general neglect of the gods. Arnobius replies to this accusation:—'If men, instead of relying upon their prudence, and following their own propensities, would try to obey the doctrines of Christ, which bring peace and salvation, the whole world would be soon changed, and the iron taken from the service of war would be employed in the works of peace.' (l. iv. c. 36.)

Arnobius thus addresses the heathen (l. iv. c. 36):—'If you were actuated by pious zeal for your religion, you should have burned those books, and destroyed the theatres in which the dishonour of the gods is daily proclaimed in indecent exhibitions. Why should our books be cast into the fire, and our places of assembly destroyed, in which the highest God is adored, and implored to give grace and peace to the magistrates, the armies, the emperor?—joy and tranquillity to the living and to those who have been released from the bonds of the body,—books and places in which nothing is heard but what is calculated to make men humane, mild, modest, chaste, liberal in dispensing their property, and relatives of all who are united by one bond of brotherhood.' (See *Allgemeine Geschichte der Christlichen Religion und Kirche von August. Neander*, ersten Bandes dritte Abtheilung, p. 1160-1165.)

Only one manuscript codex of Arnobius is known to exist; this is now at Paris. The first edition of the 'Disputations' of Arnobius is that by Faustus Sabaeus, Rome, 1542, fol. The editor has subjoined the *Octavius* of Minutius Felix as an eighth book, mistaking Octavius for Octavus. Subse-

quent editions were published at Basle, 1548, 1560, 8vo.; at Paris, 1580, 1603, 8vo.; at Antwerp, 1582, 1586, 1604, 8vo.; at Rome, 1583, 4to.; at Geneva, 1597; at Leyden, 1599; at Hanau, 1603, 8vo.; at Paris, 1605; at Hamburg, 1610, fol.; at Douay, 1634, 8vo.; Opera cum commentariis variorum, Leyden, 1651, 4to.; this edition contains many inaccuracies: at Paris, 1666, fol.; at Leyden, 1677, fol.; at Paris, 1715, fol. Venetiis in Gallandi Bibl. Vet. Patrum, tom. iv.; at Würzburg, 1783, 8vo.; more recently by Oberthür, and last by Conrad Orelli, Leipzig, 1816, in two volumes, 8vo.: this is the best edition of Arnobius. The 'Disputations' of Arnobius were translated into Dutch by Joachim Oudaer, Harling, 1677, 8vo.

The works of the Semi-Pelagian Arnobius of Gaul have sometimes been erroneously ascribed to Arnobius Afer. Arnobius of Gaul wrote, about A.D. 460, a commentary on the psalms, edited with a preface by Erasmus, at Basle, 1537; at Paris, 1539; at Basle, 1560. The 'Annotationes in Locos Evangelistarum e recognitione Andreæ Schotti' were printed with the preceding. He wrote also the following: *Conflictus cum Serapione, de Deo trino et uno; de Duobus Substantiis in Unitate Personæ et de Concordia Gratiæ et Liberi Arbitrii, cum Notis Feuardentii*, Col. Agrippinæ, 1596.
